3	Turn the ignition off. Install a substitute Swirl Solenoid. Turn the ignition on. With the DRB, erase ECM DTCs. With the DRBIII®, actuate the Swirl Solenoid. With the DRBIII®, read the ECM DTCs. Does the DRB display this DTC? Yes → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2. No → Replace the Swirl Solenoid. Perform ROAD TEST VERIFICATION - VER-2.	All
4	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary. Perform ROAD TEST VERIFICATION - VER-2. No → Test Complete.	All

Symptom:
P1270-INTAKE PORT SWIRL ACTUATOR GROUND X

When Monitored and Set Condition:

P1270-INTAKE PORT SWIRL ACTUATOR GROUND X

When Monitored: With the ignition on.

Set Condition: The ECM detects an internal fault with the Intake Port Swirl Actuator.

POSSIBLE CAUSES
INTAKE PORT SWIRL ACTUATOR

Repair Instructions:

INTAKE PORT SWIRL ACTUATOR

Replace the Intake Port Swirl Actuator.

Perform ROAD TEST VERIFICATION - VER-2.

Symptom:
P1270-INTAKE PORT SWIRL ACTUATOR OPEN CIRCUIT

When Monitored and Set Condition:

P1270-INTAKE PORT SWIRL ACTUATOR OPEN CIRCUIT

When Monitored: With the ignition on.

Set Condition: The ECM does not detect voltage on the Intake Port Swirl Actuator Control circuit.

POSSIBLE CAUSES
INTERMITTENT CONDITION
ASD RELAY OUTPUT CIRCUIT OPEN
SWIRL SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
SWIRL SOLENOID CONTROL CKT OPEN
SWIRL SOLENOID
ENGINE CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, erase ECM DTCs. With the DRBIII®, actuate the Swirl Solenoid. Monitor the DRB for ECM DTCs. Did this DTC set again? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition off. Disconnect the Swirl Solenoid harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, check the ASD Relay Output circuit. Does the test light illuminate brightly? Yes → Go To 3 No → Repair the ASD Relay Output circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
3	Turn the ignition off. Disconnect the Swirl Solenoid harness connector. Disconnect the ECM harness connectors. Measure the resistance between ground and the Swirl Solenoid Control circuit. Is the resistance above 1000 ohms? Yes → Go To 4 No → Repair the Swirl Solenoid Control circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.	All

P1270-INTAKE PORT SWIRL ACTUATOR OPEN CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the Swirl Solenoid harness connector. Disconnect the ECM harness connectors. Measure the resistance of the Swirl Solenoid Control circuit. Is the resistance below 10.0 ohms? Yes → Go To 5 No → Repair the Swirl Solenoid Control circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
5	Turn the ignition off. Install a substitute Swirl Solenoid in place of the vehicle's Swirl Solenoid. **NOTE: Ensure the ECM and Swirl Solenoid harness connectors are connected.** Turn the ignition on. With the DRBIII®, actuate the Swirl Solenoid. With the DRB, check for this DTC to set again. Did this DTC set again? Yes → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2. No → Replace the Swirl Solenoid. Perform ROAD TEST VERIFICATION - VER-2.	All
6	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time.The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary. Perform ROAD TEST VERIFICATION - VER-2. No → Test Complete.	All

Symptom:
P1499-HYDRAULIC COOLING FAN SOLENOID CIRCUIT OPEN CIRCUIT

When Monitored and Set Condition:

P1499-HYDRAULIC COOLING FAN SOLENOID CIRCUIT OPEN CIRCUIT

When Monitored: With the ignition on.

Set Condition: The ECM does not detect voltage on the Hydraulic Cooling Fan Solenoid Control circuit.

POSSIBLE CAUSES
INTERMITTENT CONDITION
ASD RELAY OUTPUT CIRCUIT OPEN
HYDRAULIC COOLING FAN SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
HYDRAULIC COOLING FAN SOLENOID CONTROL CKT OPEN
HYDRAULIC COOLING FAN SOLENOID
ENGINE CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, erase ECM DTCs. With the DRBIII®, actuate the Hydraulic Cooling Fan Solenoid. Monitor the DRB for ECM DTCs. Did this DTC set again? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition off. Disconnect the Hydraulic Cooling Fan Solenoid harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, check the ASD Relay Output circuit. Does the test light illuminate brightly? Yes → Go To 3 No → Repair the ASD Relay Output circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All

P1499-HYDRAULIC COOLING FAN SOLENOID CIRCUIT OPEN CIRCUIT

— Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Hydraulic Cooling Fan Solenoid harness connector. Disconnect the ECM harness connectors. Measure the resistance between ground and the Swirl Solenoid Control circuit. Is the resistance above 1000 ohms? Yes → Go To 4 No → Repair the Hydraulic Cooling Fan Solenoid Control circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.	All
4	Turn the ignition off. Disconnect the Hydraulic Cooling Fan Solenoid harness connector. Disconnect the ECM harness connectors. Measure the resistance of the Swirl Solenoid Control circuit. Is the resistance below 10.0 ohms? Yes → Go To 5 No → Repair the Hydraulic Cooling Fan Solenoid Control circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
5	Turn the ignition off. Install a substitute Hydraulic Cooling Fan Solenoid in place of the vehicle's Hydraulic Cooling Fan Solenoid. **NOTE: Ensure the ECM and Hydraulic Cooling Fan Solenoid harness connectors are connected.** Turn the ignition on. With the DRBIII®, actuate the Hydraulic Cooling Fan Solenoid. With the DRB, check for this DTC to set again. Did this DTC set again? Yes → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2. No → Replace the Hydraulic Cooling Fan Solenoid. Perform ROAD TEST VERIFICATION - VER-2.	All

P1499-HYDRAULIC COOLING FAN SOLENOID CIRCUIT OPEN CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
6	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. Symptom:
P1499-HYDRAULIC COOLING FAN SOLENOID CIRCUIT SHORT CIRCUIT

When Monitored and Set Condition:

P1499-HYDRAULIC COOLING FAN SOLENOID CIRCUIT SHORT CIRCUIT

When Monitored: With the ignition on and the ECM attempting to actuate the Hydraulic Cooling Fan Soleniod.

Set Condition: The ECM detects excessive current on the Hydraulic Cooling Fan Solenoid Control circuit.

POSSIBLE CAUSES
INTERMITTENT CONDITION
HYDRAULIC COOLING FAN SOLENOID
HYDRAULIC COOLING FAN SOLENOID CONTROL SHORT TO VOLTAGE
ECM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, erase ECM DTCs. With the DRBIII®, actuate the Hydraulic Cooling Fan Solenoid. With the DRBIII®, read the ECM DTCs. Did this DTC set again? Yes → Go To 2 No → Go To 4	All
2	Turn the ignition off. Disconnect the Hydraulic Cooling Fan Solenoid harness connector. Disconnect the ECM harness connectors. Remove the ASD Relay from the PDC. Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector. Turn the ignition on. Measure the voltage of the Hydraulic Cooling Fan Solenoid Control circuit. Is the voltage below 1.0 volt? Yes → Go To 3 No → Repair the Hydraulic Cooling Fan Solenoid Control circuit for a short to voltage. Perform ROAD TEST VERIFICATION - VER-2.	All

P1499-HYDRAULIC COOLING FAN SOLENOID CIRCUIT SHORT CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Install a substitute Hydraulic Cooling Fan Solenoid. Turn the ignition on. With the DRB, erase ECM DTCs. With the DRBIII®, actuate the Hydraulic Cooling Fan Solenoid. With the DRBIII®, read the ECM DTCs. Does the DRB display this DTC? Yes → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2. No → Replace the Hydraulic Cooling Fan Solenoid. Perform ROAD TEST VERIFICATION - VER-2.	All
4	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary. Perform ROAD TEST VERIFICATION - VER-2. No → Test Complete.	All

Symptom List:

P1511-BATTERY SENSE LINE 1 VOLTAGE TOO HIGH
P1511-BATTERY SENSE LINE 1 VOLTAGE TOO LOW
P1512-BATTERY SENSE LINE 2 VOLTAGE TOO HIGH
P1512-BATTERY SENSE LINE 2 VOLTAGE TOO LOW

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P1511-BATTERY SENSE LINE 1 VOLTAGE TOO HIGH.

When Monitored and Set Condition:

P1511-BATTERY SENSE LINE 1 VOLTAGE TOO HIGH

When Monitored: With the ignition on or the engine running.

Set Condition: The ECM detects Battery Sense circuit voltage above 16.0 volts.

P1511-BATTERY SENSE LINE 1 VOLTAGE TOO LOW

When Monitored: With the ignition on or the engine running.

Set Condition: The ECM detects Battery Sense circuit voltage below 6.0 volts.

P1512-BATTERY SENSE LINE 2 VOLTAGE TOO HIGH

When Monitored: With the ignition on or the engine running.

Set Condition: The ECM detects Battery Sense circuit voltage above 2.0 volts.

P1512-BATTERY SENSE LINE 2 VOLTAGE TOO LOW

When Monitored: With the ignition on or the engine running.

Set Condition: The ECM detects Battery Sense circuit voltage below -2.0 volts.

POSSIBLE CAUSES
INTERMITTENT CONDITION
FUSE 26 OPEN
ECM GROUND CIRCUIT(S) OPEN
BATTERY(-) SENSE CIRCUIT SHORTED TO VOLTAGE
BATTERY(-) SENSE CIRCUIT OPEN
BATTERY(+) SENSE CIRCUIT SHORTED TO GROUND
BATTERY(+) SENSE CIRCUIT OPEN
ENGINE CONTROL MODULE

P1511-BATTERY SENSE LINE 1 VOLTAGE TOO HIGH — Continued

TEST	ACTION	APPLICABILITY
1	**NOTE: If DTC P0560-SYSTEM VOLTAGE TOO HIGH is present with this DTC, perform diagnostics for P0560 first.** Turn the ignition on. With the DRBIII®, erase the ECM DTCs. Test drive the vehicle. With the DRBIII®, read the ECM DTCs. Does the DRBIII® display this DTC? Yes → Go To 2 No → Go To 9	All
2	Turn the ignition off. Remove and inspect Fuse 26 from the PDC. Is the fuse OK? Yes → Go To 3 No → Repair the short that caused the fuse to open and replace the fuse. Perform ROAD TEST VERIFICATION - VER-2.	All
3	Turn the ignition off. Disconnect the ECM harness connectors. Using a 12-volt test light connected to 12-volts, check both of the ECM ground circuits in ECM harness connector C1 cavities 1 and 2. Did the test light illuminate for both cavities? Yes → Go To 4 No → Repair the ECM Ground circuit(s) for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
4	Turn the ignition off. Disconnect the ECM harness connectors. Remove the ASD Relay from the PDC. Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector. Turn the ignition on. Measure the voltage of the Battery (-) Sense circuit in ECM harness connector cavity C1-20. Is the voltage below 1.0 volt? Yes → Go To 5 No → Repair the Battery(-) Sense circuit for a short to voltage. Perform ROAD TEST VERIFICATION - VER-2.	All
5	Turn the ignition off. Disconnect the ECM harness connectors. Remove Fuse 26 from the PDC. **NOTE: A short to ground on any circuit associated with Fuse 6 or 26 may cause this DTC to set.** Measure the resistance between ground and the Battery(+) Sense circuit in ECM harness connector C1-19. Is the resistance above 100 kohms? Yes → Go To 6 No → Repair the Battery(+) Sense circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.	All

P1511-BATTERY SENSE LINE 1 VOLTAGE TOO HIGH — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off. Disconnect the ECM harness connectors. Measure the resistance between the Battery negative terminal and the Battery(-) Sense circuit in ECM harness connector cavity C1-20. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the Battery(-) Sense circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
7	Turn the ignition off. Disconnect the ECM harness connectors. Remove Fuse 26 from the PDC. Measure the resistance of the Battery(+) Sense circuit. Is the resistance below 5.0 ohms? Yes → Go To 8 No → Repair the Battery(+) Sense circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
8	If there are no possible causes remaining, view repair. Repair Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.	All
9	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running and at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary. Perform ROAD TEST VERIFICATION - VER-2. No → Test Complete.	All

Symptom:
P1605-IGNITION SWITCH PLAUSIBILITY

When Monitored and Set Condition:

P1605-IGNITION SWITCH PLAUSIBILITY

When Monitored: When the ignition is first turned on.

Set Condition: The ECM detects the Ignition Switch Sense momentarily return to the OFF state during ECM initialization.

POSSIBLE CAUSES
INTERMITTENT CONDITION
ENGINE CONTROL MODULE
FUSED IGNITION SWITCH OUTPUT (RUN/START) CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT (RUN/START) CIRCUIT SHORTED TO GROUND

TEST	ACTION	APPLICABILITY
1	**NOTE: This DTC is set when the ECM sees a change from On to Off and then back On within a few milliseconds during ECM initialization at Key On. Look for an intermittent open or short to ground on the Ignition Switch Sense circuit.** Turn the ignition on. With the DRB, erase ECM DTCs. Cycle the ignition switch on and off several times, pausing for at least 10 seconds at each key off and key on. Turn the ignition on. With the DRB, read ECM DTCs. Did this DTC set again? Yes → Go To 2 No → Go To 5	All
2	Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the ignition switch harness connector. Measure the resistance of the Fused Ignition Switch Output (RUN/START) circuit. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the Fused Ignition Switch Output (RUN/START) circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All

P1605-IGNITION SWITCH PLAUSIBILITY — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the ignition switch harness connector. Measure the resistance between ground and the Fused Ignition Switch Output (RUN/START) circuit. Is the resistance above 100 kohms? Yes → Go To 4 No → Repair the Fused Ignition Switch Output (RUN/START) circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.	All
4	If there are no possible causes remaining, view repair. Repair Using the schematic, ensure no shared circuits on the Fused Ignition Switch Output (RUN/START) ckt are causing an initial low spike in circuit voltage. If all other components are OK, replace and program the ECM in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.	All
5	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary. Perform ROAD TEST VERIFICATION - VER-2. No → Test Complete.	All

Symptom List:
P1643-VISCOUS HEATER RELAY OPEN CIRCUIT
P1643-VISCOUS HEATER RELAY SHORT CIRCUIT

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P1643-VISCOUS HEATER RELAY OPEN CIRCUIT.

When Monitored and Set Condition:

P1643-VISCOUS HEATER RELAY OPEN CIRCUIT

When Monitored: With the ignition on.

Set Condition: The ECM does not detect voltage on the Viscous Heater Relay Control circuit.

P1643-VISCOUS HEATER RELAY SHORT CIRCUIT

When Monitored: With the ignition on.

Set Condition: The ECM detects excessive current on the Viscous Heater Relay Control circuit.

POSSIBLE CAUSES
INTERMITTENT CONDITION
ASD RELAY OUTPUT CIRCUIT OPEN
SUBSTITUTE VISCOUS HEATER RELAY
VISCOUS HEATER RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
VISCOUS HEATER RELAY CONTROL CIRCUIT SHORTED TO GROUND
VAISCOUS HEATER RELAY CONTROL CIRCUIT OPEN
ENGINE CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, actuate the Viscous Heater Relay. Is the Viscous Heater Relay clicking? Yes → Go To 2 No → Go To 3	All

P1643-VISCOUS HEATER RELAY OPEN CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
2	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary. Perform ROAD TEST VERIFICATION - VER-2. No → Test Complete.	All
3	Turn the ignition off. Disconnect the Viscous Heater Relay from the PDC. Turn the ignition on. Using a 12-volt test light connected to ground, check the ASD Relay Output circuit at the Viscous Heater Relay connector in the PDC. Does the test light illuminate brightly? Yes → Go To 4 No → Repair the ASD Relay Output circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
4	Turn the ignition off. Install a substitute relay in place of the Viscous Heater Relay. Turn the ignition on. With the DRB, actuate the Viscous/Cabin Heater Relay for at least 20 seconds. With the DRB, read ECM DTCs. Did this DTC set again? Yes → Go To 5 No → Replace the Viscous Heater Relay. Perform ROAD TEST VERIFICATION - VER-2.	All
5	Turn the ignition off. Disconnect the ECM harness connectors. Remove the Viscous Heater Relay. Remove the ASD Relay from the PDC. Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector in the PDC. Turn the ignition on. Measure the voltage on the Viscous Heater Relay Control circuit. Is the voltage above 1.0 volt? Yes → Repair the Viscous Heater Relay Control circuit for a short to voltage. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 6	All

P1643-VISCOUS HEATER RELAY OPEN CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off. Remove the Viscous Heater Relay from the PDC. Disconnect the ECM harness connectors. Measure the resistance between ground and the Viscous Heater Relay Control circuit. Is the resistance above 1000 ohms? Yes → Go To 7 No → Repair the Viscous Heater Relay Control circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.	All
7	Turn the ignition off. Remove the Viscous Heater Relay from the PDC. Disconnect the ECM harness connectors. Measure the resistance of the Viscous Heater Relay Control circuit. Is the resistance below 10.0 ohms? Yes → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2. No → Repair the Viscous Heater Relay Control circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All

Symptom List:

P1651-MIL/DIAG LAMP VIA J1850 BUS IN FRAME RESPONSE ERROR
P1651-MIL/DIAG LAMP VIA J1850 BUS STATUS ERROR

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P1651-MIL/DIAG LAMP VIA J1850 BUS IN FRAME RESPONSE ERROR.

When Monitored and Set Condition:

P1651-MIL/DIAG LAMP VIA J1850 BUS IN FRAME RESPONSE ERROR

When Monitored: With the ignition on.

Set Condition: The ECM does not receive a response from the instrument cluster when a J1850 message to actuate the MIL is transmitted.

P1651-MIL/DIAG LAMP VIA J1850 BUS STATUS ERROR

When Monitored: With the ignition on.

Set Condition: The ECM MIL status does not agree with the instrument cluster MIL status.

POSSIBLE CAUSES
REFER TO COMMUNICATION SECTION
VERIFY INSTRUMENT CLUSTER COMMUNICATION
INTERMITTENT CONDITION

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, erase the ECM DTCs. Cycle the ignition switch from OFF to ON. Monitor the DRBIII® for ECM DTCs. Does the DRBIII® display this DTC? Yes → Go To 2 No → Go To 3	All

P1651-MIL/DIAG LAMP VIA J1850 BUS IN FRAME RESPONSE ERROR — Continued

TEST	ACTION	APPLICABILITY
2	Start and idle the engine. With the DRBIII®, select Instrument Cluster and read the PCM/ECM Monitors. **NOTE: If the DRB is unable to communicate with the Instrument cluster, refer to the appropriate symptom in the Body Diagnostic Information** Does the DRB display accurate monitors? Yes → [007f]Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2. No → Refer to Body Diagnostic Information for problems related to Communication with ECM. Perform ROAD TEST VERIFICATION - VER-2.	All
3	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary. Perform ROAD TEST VERIFICATION - VER-2. No → Test Complete.	All

Symptom List:

P1652-J1850 COMMUNICATION BUS LOST ARBITRATION
P1652-J1850 COMMUNICATION BUS RECEIVE TIMEOUT
P1652-J1850 COMMUNICATION BUS SHORT TO GROUND
P1652-J1850 COMMUNICATION BUS SHORT TO VOLTAGE
P1652-J1850 COMMUNICATION BUS SPI ERROR
P1652-J1850 COMMUNICATION BUS TRANSMIT BUFFER OVER-RUN
P1652-J1850 COMMUNICATION BUS UNAUTHORIZED RESET

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P1652-J1850 COMMUNICATION BUS LOST ARBITRATION.

When Monitored and Set Condition:

P1652-J1850 COMMUNICATION BUS LOST ARBITRATION

When Monitored: With the ignition on.

Set Condition: A J1850 Bus error occurred while the ECM was sending a message.

P1652-J1850 COMMUNICATION BUS RECEIVE TIMEOUT

When Monitored: With the ignition on.

Set Condition: The ECM has not received a J1850 Bus massage for 2.0 seconds.

P1652-J1850 COMMUNICATION BUS SHORT TO GROUND

When Monitored: With the ignition on.

Set Condition: The ECM detects continuous low voltage on the J1850 Bus circuit.

P1652-J1850 COMMUNICATION BUS SHORT TO VOLTAGE

When Monitored: With the ignition on.

Set Condition: The ECM detects continuous high voltage on the J1850 Bus circuit.

P1652-J1850 COMMUNICATION BUS SPI ERROR

When Monitored: With the ignition on.

Set Condition: The ECM has detected an internal communication problem.

P1652-J1850 COMMUNICATION BUS TRANSMIT BUFFER OVERRUN

When Monitored: With the ignition on.

Set Condition: The ECM has detected an internal problem.

P1652-J1850 COMMUNICATION BUS LOST ARBITRATION — Continued

P1652-J1850 COMMUNICATION BUS UNAUTHORIZED RESET

When Monitored: With the ignition on.

Set Condition: An unauthorized reset of the J1850 hardware occurs during normal operation.

POSSIBLE CAUSES
VERIFY ACTIVE DTC
VERIFY INSTRUMENT CLUSTER COMMUNICATION
INTERMITTENT CONDITION

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII® attempt to communicate with the Instrument Cluster. Is the Instrument Cluster communicating with the DRB? Yes → Go To 2 No → Refer to the appropriate symptom in the Body Diagnostic Information. Perform ROAD TEST VERIFICATION - VER-2.	All
2	Turn the ignition on. With the DRBIII®, erase the ECM DTCs. Turn the ignition off then turn the ignition on and wait 60 seconds. With the DRBIII®, read the ECM DTCs. Does the DRB display this DTC? Yes → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 3	All

P1652-J1850 COMMUNICATION BUS LOST ARBITRATION — Continued

TEST	ACTION	APPLICABILITY
3	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary. Perform ROAD TEST VERIFICATION - VER-2. No → Test Complete.	All

Symptom:
P1685-SKIM SYSTEM INVALID KEY CODE RECEIVED

When Monitored and Set Condition:

P1685-SKIM SYSTEM INVALID KEY CODE RECEIVED

When Monitored: With the ignition on.

Set Condition: The ECM receives a message from the SKIM indicating an incorrect message was received from the ignition key.

POSSIBLE CAUSES
SKIM/IGNITION KEY FAULT

TEST	ACTION	APPLICABILITY
1	This fault indicates a SKIS problem. View repair. Yes → Refer to SKIS information for the related symptom(s). Perform ROAD TEST VERIFICATION - VER-2.	All

Symptom:
P1685-SKIM SYSTEM KEY COMMUNICATION TIMED OUT

When Monitored and Set Condition:

P1685-SKIM SYSTEM KEY COMMUNICATION TIMED OUT

When Monitored: With the ignition on.

Set Condition: Communication between the ECM and the SKIM is not completed within 2.0 seconds

POSSIBLE CAUSES
SKIM
INTERMITTENT CONDITION
CHECK FOR SKIM COMMUNICATION AND DTCS
ENGINE CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, check for Sentry Key Immobilizer Module communication and DTCs. Are any SKIS problems or DTCs present? Yes → Refer to symptom list for problems related to SKIM Communication and DTCs before continuing. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 2	All
2	Turn the ignition on. With the DRBIII®, erase ECM DTCs. Turn the ignition on and off several times pausing 10 seconds between each key cycle. With the DRBIII®, read the ECM DTCs. Are any P1685 DTCs present? Yes → Go To 3 No → Go To 4	All
3	Replace and program the SKIM in accordance with the Service Information. Turn the ignition on. With the DRBIII®, erase ECM DTCs. Turn the ignition on and off several times pausing for 10 seconds between key cycles. With the DRBIII®, read ECM DTCs. Are there any P1685 DTCs present? Yes → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2. No → The test is complete. Perform ROAD TEST VERIFICATION - VER-2.	All

P1685-SKIM SYSTEM KEY COMMUNICATION TIMED OUT — Continued

TEST	ACTION	APPLICABILITY
4	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary. Perform ROAD TEST VERIFICATION - VER-2. No → Test Complete.	All

Symptom List:

P2120-ACC PEDAL POSITION SENSOR 1 CKT PLAUSIBILITY
P2120-ACC PEDAL POSITION SENSOR 1 CKT PLAUSIBILITY WITH BRAKE SWITCH
P2120-ACC PEDAL POSITION SENSOR 1 CKT SIGNAL VOLTAGE TOO HIGH
P2120-ACC PEDAL POSITION SENSOR 1 CKT SIGNAL VOLTAGE TOO LOW
P2120-ACC PEDAL POSITION SENSOR 1 CKT SUPPLY VOLTAGE TOO HIGH OR LOW
P2125-ACC PEDAL POSITION SENSOR 2 CIRCUIT PLAUSIBILITY (WITH SENSOR 1 CIRCUIT)
P2125-ACC PEDAL POSITION SENSOR 2 CKT SIGNAL VOLTAGE TOO HIGH
P2125-ACC PEDAL POSITION SENSOR 2 CKT SUPPLY VOLTAGE TOO HIGH OR LOW

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P2120-ACC PEDAL POSITION SENSOR 1 CKT PLAUSIBILITY.

When Monitored and Set Condition:

P2120-ACC PEDAL POSITION SENSOR 1 CKT PLAUSIBILITY

When Monitored: With the ignition on.

Set Condition: The Accelerator Pedal Position Sensor Signal is below 1.6% or above 17.6% and the idle switch is not in the correct state. NOTE: The idle switch is designed to transition when the accel position is approximately 16% (1.00 volt). This code sets the ECM to Limp-in Mode, which includes a fixed engine speed of 1100 RPM.

P2120-ACC PEDAL POSITION SENSOR 1 CKT PLAUSIBILITY WITH BRAKE SWITCH

When Monitored: With the engine speed above 700 rpm.

Set Condition: The ECM detects the Accelerator Pedal and the Brake Pedal have been depressed at the same time for longer than 5.0 seconds.

P2120-ACC PEDAL POSITION SENSOR 1 CKT SIGNAL VOLTAGE TOO HIGH

When Monitored: With the ignition on.

Set Condition: The ECM detects voltage on the Accelerator Pedal Position Sensor Signal circuit above 4.5 volts.

P2120-ACC PEDAL POSITION SENSOR 1 CKT PLAUSIBILITY — Continued

P2120-ACC PEDAL POSITION SENSOR 1 CKT SIGNAL VOLTAGE TOO LOW

When Monitored: With the ignition on.

Set Condition: The ECM detects voltage on the Accelerator Pedal Position Sensor Signal circuit 0.0 volt.

P2120-ACC PEDAL POSITION SENSOR 1 CKT SUPPLY VOLTAGE TOO HIGH OR LOW

When Monitored: With the ignition on.

Set Condition: The Accelerator Pedal Position Sensor 5-Volt Supply voltage is above 5.1 volts or below 4.9 volts.

P2125-ACC PEDAL POSITION SENSOR 2 CIRCUIT PLAUSIBILITY (WITH SENSOR 1 CIRCUIT)

When Monitored: With the ignition on.

Set Condition: The ECM determines that the APP Sensor #1 and APP Sensor #2 signals do not agree.

P2125-ACC PEDAL POSITION SENSOR 2 CKT SIGNAL VOLTAGE TOO HIGH

When Monitored: With the ignition on.

Set Condition: The ECM detects voltage on the Accelerator Pedal Position Sensor Signal circuit above 3.3 volts.

P2125-ACC PEDAL POSITION SENSOR 2 CKT SUPPLY VOLTAGE TOO HIGH OR LOW

When Monitored: With the ignition on.

Set Condition: The Accelerator Pedal Position Sensor 5-Volt Supply voltage is above 5.1 volts or below 4.9 volts.

POSSIBLE CAUSES
ACCELERATOR PEDAL POSITION SENSOR
ECM - 5-VOLT SUPPLY CIRCUIT
SENSOR GROUND OPEN (APP SENSOR)
INTERMITTENT CONDITION
5-VOLT SUPPLY OR SENSOR REFERENCE VOLTAGE A CIRCUIT OPEN
APP SENSOR SIGNAL CIRCUIT OPEN
5-VOLT SUP OR SENSOR REF VOLTAGE A CIRCUIT SHORTED TO THE SENSOR GROUND CIRCUIT
APP SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
5-VOLT SUPPLY OR SENSOR REF VOLTAGE A CIRCUIT SHORTED TO GROUND

P2120-ACC PEDAL POSITION SENSOR 1 CKT PLAUSIBILITY — Continued

POSSIBLE CAUSES
VERIFY APP SENSOR OPERATION
APP SENSOR SIGNAL CIRCUIT SHORTED TO THE SENSOR GROUND CIRCUIT
5-VOLT SUPPLY OR SENSOR REF VOLTAGE A CIRCUIT SHORTED TO VOLTAGE
ECM - SENSOR GROUND OPEN
APP SENSOR CIRCUIT SHORTED TO VOLTAGE
APP SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
ECM - APP SENSOR SIGNAL CIRCUIT

TEST	ACTION	APPLICABILITY
1	**NOTE: If DTC P0641 or P0651 is present with this DTC, diagnose DTCs P0641 and P0651 before diagnosing this DTC.** **NOTE: The APP Sensor is a device that contains 2 separate potentiometer type sensors. Each sensor has its own 5-volt supply circuit, sensor ground circuit and signal circuit. The APP Sensor no longer incorporates a low-idle switch.** **NOTE: The APP Sensor #2 signal should always be 1/2 the voltage of the APP Sensor #1 signal.** Turn the ignition on. With the DRB, read the APP Sensor #1 and APP Sensor #2 Volts with the accelerator pedal in the at rest position. Does the DRB display between 0.50 and 0.90 volt for sensor #1 and 1/2 the #1 voltage for #2? Yes → Go To 2 No → Go To 5	All
2	Turn the ignition on. Fully depress the accelerator pedal. With the DRB, read the voltage for APP Sensor #1 and APP Sensor #2. Does the DRB display between 4.0 and 4.5 volts for #1 and 1/2 #1 voltage for #2? Yes → Go To 3 No → Go To 5	All
3	Turn the ignition on. With the DRB, read the APP Sensor #1 and APP Sensor #2 percentages (%). With the accelerator pedal in the idle position, slowly depress the accelerator pedal until the pedal is fully depressed. **NOTE: The percentage readings for APP Sensor #1 and #2 should increase smoothly as the pedal is depressed.** Does the percentage increase smoothly for both readings with the accelerator pedal travel? Yes → Go To 4 No → Replace the Accelerator Pedal Position Sensor in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.	All

P2120-ACC PEDAL POSITION SENSOR 1 CKT PLAUSIBILITY — Continued

TEST	ACTION	APPLICABILITY
4	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** **NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.** With the engine running and at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set by slowly pressing and releasing the accelerator pedal several times. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary. Perform ROAD TEST VERIFICATION - VER-2. No → Test Complete.	All
5	**NOTE: Perform the rest of this diagnostic procedure on the individual APP Sensor Potentiometer (#1 or #2) that did not display the correct voltages in the previous test.** Turn the ignition off. Disconnect the APP Sensor harness connector. Turn the ignition on. Measure the voltage of the 5-volt Supply (Sensor Reference Voltage A on Sensor #2) circuit in APP Sensor harness connector. Is the voltage between 4.7 and 5.3 volts? Yes → Go To 6 No → Go To 14	All
6	Turn the ignition off. Disconnect the APP Sensor harness connector. Connect a jumper wire between APP Sensor Signal circuit and the 5-volt supply circuit at the APP Sensor harness connector . With the DRB, read the PEDAL OUTPUT VOLTS. Does the DRB display between 4.0 and 5.5 volts? Yes → Go To 7 No → Go To 10	All
7	Turn the ignition off. Disconnect the APP Sensor harness connector. Disconnect the ECM harness connectors. Remove the ASD Relay from the PDC. Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector. Turn the ignition on. Measure the voltage of the APP Sensor Ground circuit. Is the voltage above 1.0 volt? Yes → Repair the App Sensor Ground circuit for a short to voltage. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 8	All

P2120-ACC PEDAL POSITION SENSOR 1 CKT PLAUSIBILITY — Continued

TEST	ACTION	APPLICABILITY
8	Turn the ignition off. Disconnect the APP Sensor harness connector. Disconnect the ECM harness connectors. Measure the resistance of the Sensor Ground circuit between the APP Sensor and the ECM. Is the resistance below 10.0 ohms? Yes → Go To 9 No → Repair the APP Sensor Ground circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
9	Turn the ignition off. Disconnect the APP Sensor harness connector. Using a 12-volt test light connected to 12-volts, check the Sensor ground circuit of the appropriate potentiometer. Does the test light illuminate brightly? Yes → Replace the Accelerator Pedal Position Sensor. Perform ROAD TEST VERIFICATION - VER-2. No → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.	All
10	Turn the ignition off. Disconnect the APP Sensor harness connector. Disconnect the ECM harness connectors. Measure the resistance of the APP Sensor Signal circuit. Is the resistance below 10.0 ohms? Yes → Go To 11 No → Repair the APP Sensor Signal circuit for an open Perform ROAD TEST VERIFICATION - VER-2.	All
11	Turn the ignition off. Disconnect the APP Sensor harness connector. Disconnect the ECM harness connectors. Measure the resistance between ground and the APP Sensor Signal circuit. Is the resistance below 1000 ohms? Yes → Repair the APP Sensor Signal circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 12	All
12	Turn the ignition off. Disconnect the APP Sensor harness connector. Disconnect the ECM harness connectors. Measure the resistance between the APP Sensor Signal circuit and the Sensor Ground circuit at of the APP Sensor harness connector. Is the resistance below 1000 ohms? Yes → Repair the APP Sensor Signal and Sensor Ground circuits for a short together. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 13	All

P2120-ACC PEDAL POSITION SENSOR 1 CKT PLAUSIBILITY — Continued

TEST	ACTION	APPLICABILITY
13	Turn the ignition off. Disconnect the APP Sensor harness connector. Disconnect the ECM harness connectors. Remove the ASD Relay from the PDC. Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector. Turn the ignition on. Measure the voltage of the APP Sensor Signal circuit. Is the voltage above 1.0 volt? Yes → Repair the APP Sensor Signal circuit for a short to voltage. Perform ROAD TEST VERIFICATION - VER-2. No → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.	All
14	Turn the ignition off. Disconnect the APP Sensor harness connector. Disconnect the ECM harness connectors. Measure the resistance of the 5-volt Supply (Sensor Reference Voltage A on Sensor #2) circuit. Is the resistance below 10.0 ohms? Yes → Go To 15 No → Repair the 5-volt Supply (Sensor Reference Voltage A on Sensor #2) circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
15	Turn the ignition off. Disconnect the APP Sensor harness connector. Disconnect the ECM harness connectors. Measure the resistance between the 5-volt Supply (Sensor Reference Voltage A on Sensor #2) circuit and the Sensor Ground circuit at the APP Sensor harness connector. Is the resistance above 1000 ohms? Yes → Go To 16 No → Repair the 5-volt Supply (Sensor Reference Voltage A on Sensor #2) circuit for a short to the Sensor Ground circuit. Perform ROAD TEST VERIFICATION - VER-2.	All
16	Turn the ignition off. Disconnect the APP Sensor harness connector. Disconnect the ECM harness connectors. Measure the resistance between ground and the 5-volt Supply (Sensor Reference Voltage A on Sensor #2) circuit. Is the resistance below 1000 ohms? Yes → Repair the 5-volt Supply (Sensor Reference Voltage A on Sensor #2) circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 17	All

P2120-ACC PEDAL POSITION SENSOR 1 CKT PLAUSIBILITY — Continued

TEST	ACTION	APPLICABILITY
17	Turn the ignition off. Disconnect the APP Sensor harness connector. Disconnect the ECM harness connectors. Remove the ASD Relay from the PDC. Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector. Turn the ignition on. Measure the voltage of the 5-volt Supply (Sensor Reference Voltage A on Sensor #2) circuit in the ECM harness connector. Is the voltage above 1.0 volt? Yes → Repair the 5-volt Supply (Sensor Reference Voltage A on Sensor #2) circuit for a short to voltage. Perform ROAD TEST VERIFICATION - VER-2. No → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.	All

Symptom:
*A/C INOPERATIVE

POSSIBLE CAUSES
CHECK FOR ECM DTCS
FUSED B+ CIRCUIT OPEN
A/C CLUTCH RELAY
A/C CLUTCH RELAY OUTPUT CIRCUIT SHORTED TO GROUND
A/C CLUTCH RELAY OUTPUT CIRCUIT OPEN
A/C CLUTCH GROUND CIRCUIT OPEN
A/C CLUTCH
ECM - INTERNAL FAULT
AZC MODULE OR A/C - HEATER CONTROL MODULE
BCM - NO SWITCH STATE CHANGE
A/C SWITCH SIGNAL CIRCUIT OPEN
BCM - ON/OFF CONTROL CIRCUIT OPEN

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that the refrigerant system is properly charged. Refer to the appropriate Service Information.** With the DRBIII®, check for ECM DTCs. Are any DTCs present? Yes → Return to the symptom list and choose the symptom(s). Perform ROAD TEST VERIFICATION - VER-2. No → Go To 2	All
2	Turn the ignition on. Position the Mode switch on the AZC Module or the A/C - Heater Control Module to the Panel position. Turn the A/C Select switch off. With the DRBIII® in BCM, select Inputs/Outputs. Monitor the A/C Select Switch state while turning the A/C Select switch from off to on and then back to off. Does the switch state change from Off to On and then back to Off? Yes → Go To 3 No → Go To 10	All
3	Turn the ignition on. With the DRBIII®, actuate the A/C Compressor Clutch Relay. Observe the A/C Compressor Clutch during actuation. Is the A/C Compressor Clutch clicking? Yes → Replace and program the ECM in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 4	All

*A/C INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
4	**NOTE: If the A/C Clutch fuse is open, refer to the system schematics for all circuits that are powered by the A/C Clutch fuse to determine the cause of the blown fuse.** Turn the ignition off. Remove the A/C Clutch Relay from the PDC. Using a 12-volt test light connected to ground, probe the Fused B+ circuit in the PDC. Does the test light illuminate brightly? Yes → Go To 5 No → Repair the Fused B+ circuit. Inspect fuse and replace as necessary. Perform ROAD TEST VERIFICATION - VER-2.	All
5	Turn the ignition off. Install a substitute relay in place of the A/C Clutch Relay. Turn the ignition on. With the DRBIII®, actuate the A/C Clutch Relay. Does the A/C Clutch Relay cycle on and off? Yes → Replace the A/C Clutch Relay. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 6	All
6	Turn the ignition off. Remove the A/C Clutch Relay from the PDC. Disconnect the A/C Clutch harness connector. Measure the resistance between ground and the A/C Clutch Relay Output circuit. Is the resistance above 100 kohms? Yes → Go To 7 No → Repair the A/C Clutch Relay Output circuit for a short to ground. Inspect fuse and replace as necessary. Perform ROAD TEST VERIFICATION - VER-2.	All
7	Turn the ignition off. Remove the A/C Clutch Relay from the PDC. Disconnect the A/C Clutch harness connector. Measure the resistance of the A/C Clutch Relay Output circuit. Is the resistance below 5.0 ohms? Yes → Go To 8 No → Repair the A/C Clutch Relay Output circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
8	Turn the ignition off. Disconnect the A/C Clutch harness connector. Using a 12-volt test light connected to 12-volts, check the A/C Clutch Ground circuit. Does the test light illuminate brightly? Yes → Go To 9 No → Repair the A/C Clutch Ground circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All

*A/C INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
9	If there are no possible causes remaining, view repair. Repair Replace the A/C Clutch in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.	All
10	Turn the ignition off. Disconnect the AZC Module C2 harness connector or the A/C - Heater Control C1 harness connector. Turn the ignition on. Measure the voltage of the A/C Switch Signal circuit. Is the voltage greater than 11.0 volts? Yes → Go To 11 No → Go To 12	All
11	Turn the ignition off. Disconnect the AZC Module C2 harness connector or the A/C - Heater Control C1 harness connector. Turn the ignition on. With the DRBIII® in BCM, select Inputs/Outputs. Monitor the A/C Select Switch state while connecting a jumper wire between ground and the A/C Switch Signal circuit in the AZC Module C2 harness connector or the A/C - Heater Control C1 harness connector. Does the A/C Select Switch state change from Off to On when the jumper wire is connected? Yes → Replace the AZC Module or the A/C - Heater Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Replace and program the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
12	Turn the ignition off. Disconnect the BCM C1 harness connector. Disconnect the AZC Module C2 harness connector or the A/C - Heater Control C1 harness connector. Measure the resistance of the A/C Switch Signal circuit between the AZC Module C2 harness connector or the A/C - Heater Control C1 harness connector and the BCM C1 harness connector. Is the resistance below 5.0 ohms? Yes → Replace and program the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Repair the A/C Switch Signal circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*A/C OPERATES IN ALL MODE SWITCH POSITIONS

POSSIBLE CAUSES
CHECK FOR ECM DTCS
A/C CLUTCH
A/C CLUTCH RELAY OUTPUT CIRCUIT SHORTED TO VOLTAGE
A/C CLUTCH RELAY
ENGINE CONTROL MODULE
A/C SWITCH SIGNAL CIRCUIT SHORTED TO GROUND
AZC MODULE OR A/C - HEATER CONTROL MODULE
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, check for ECM DTCs. Are any DTCs present? Yes → Return to the symptom list and choose the symptom(s). Perform ROAD TEST VERIFICATION - VER-2. No → Go To 2	All
2	Turn the ignition on. Position the Mode switch on the AZC Module or the A/C - Heater Control Module to the Panel position. Turn the A/C Select switch off. With the DRBIII® in BCM, select Inputs/Outputs. Monitor the A/C Select Switch state while turning the A/C Select switch from off to on and then back to off. Does the switch state change from Off to On and then back to Off? Yes → Go To 3 No → Go To 6	All
3	Turn the ignition off. Disconnect the A/C Clutch harness connector. **WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** Start the engine and observe the A/C Clutch and Compressor. Does the A/C Compressor run with the harness connector disconnected? Yes → Replace the A/C Clutch in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 4	All

*A/C OPERATES IN ALL MODE SWITCH POSITIONS — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Remove the A/C Clutch Relay from the PDC. Disconnect the A/C Clutch harness connector. Turn the ignition on. Measure the voltage of the A/C Clutch Relay Output circuit. Is the voltage above 1.0 volt? Yes → Repair the A/C Clutch Relay Output circuit for a short to voltage. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 5	All
5	Turn the ignition off. Install a substitute relay in place of the A/C Clutch Relay. Turn the ignition on. With the DRBIII®, actuate the A/C Clutch Relay. Does the A/C Clutch Relay cycle on and off? Yes → Replace the A/C Clutch Relay. Perform ROAD TEST VERIFICATION - VER-2. No → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.	All
6	Turn the ignition off. Disconnect the BCM C2 harness connector. Disconnect the AZC Module C2 harness connector or the A/C - Heater Control C1 harness connector. Measure the resistance of the A/C Switch Signal circuit between the AZC Module C2 harness connector or the A/C - Heater Control C1 harness connector and ground. Is the resistance below 100K ohms? Yes → Repair the A/C Switch Signal Circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 7	All
7	Turn the ignition off. Make sure that the BCM harness connectors are connected to the BCM. Disconnect the AZC Module C2 harness connector or the A/C - Heater Control C1 harness connector. Turn the ignition on. With the DRBIII® in BCM, select Inputs/Outputs. Monitor the A/C Select Switch state while connecting a jumper wire between ground and the A/C Switch Signal circuit in the AZC Module C2 harness connector or the A/C - Heater Control C1 harness connector. Does the A/C Select Switch state change from Off to On when the jumper wire is connected? Yes → Replace the AZC Module or the A/C - Heater Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Replace and program the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*CHECKING THE ACCELERATOR PEDAL POSITION SENSOR CALIBRATION

POSSIBLE CAUSES
APP SENSOR IDLE VOLTAGE
APP SENSOR WIDE OPEN THROTTLE VOLTAGE
VERIFY APP SENSOR OPERATION

TEST	ACTION	APPLICABILITY
1	**NOTE: The APP Sensor is a device that contains 2 separate potentiometer type sensors. Each sensor receives it's own 5-volt supply circuit, sensor ground circuit and signal circuit. The APP Sensor no longer incorporates a low-idle switch.** **NOTE: The APP Sensor #2 signal should always be 1/2 the voltage as the APP Sensor #1 signal** Turn the ignition on. With the DRB, read the APP Sensor #1 and APP Sensor #2 Volts with the accelerator pedal in the at rest position. Does the DRB display between 0.50 and 0.90 volt for sensor #1 and 1/2 the #1 voltage for #2? Yes → Go To 2 No → Replace the Accelerator Pedal Position Sensor. Perform ROAD TEST VERIFICATION - VER-2.	All
2	Turn the ignition on. Fully depress the accelerator pedal. With the DRB, read the voltage for APP Sensor #1 and APP Sensor #2. Does the DRB display between 4.0 and 4.5 volts for #1 and 1/2 #1 voltage for #2? Yes → Go To 3 No → Replace the Accelerator Pedal Position Sensor. Perform ROAD TEST VERIFICATION - VER-2.	All
3	Turn the ignition on. With the DRB, read the APP Sensor #1 and APP Sensor #2 percentages (%). With the accelerator pedal in the idle position, slowly depress the accelerator pedal until the pedal is fully depressed. **NOTE: The percentage readings for APP Sensor #1 and #2 should increase smoothly as the pedal is depressed.** Does the percentage increase smoothly for both readings with the accelerator pedal travel? Yes → Test Complete. No → Replace the Accelerator Pedal Position Sensor. Perform ROAD TEST VERIFICATION - VER-2.	All

Symptom:
*CHECKING THE BOOST PRESSURE SENSOR CALIBRATION

POSSIBLE CAUSES
TURBOCHARGER BOOST PRESSURE SENSOR CALIBRATION

TEST	ACTION	APPLICABILITY
1	Allow the engine to idle. With the DRBIII®, select Engine, then Sensors. Read the Boost Pressure Voltage. Is the Boost Pressure Voltage between 1.50 and 2.00 volts? Yes → Test Complete. No → Replace the Turbocharger Boost Pressure Sensor. Perform ROAD TEST VERIFICATION - VER-2.	All

Symptom:
*CHECKING THE ECM POWER AND GROUND CIRCUITS

POSSIBLE CAUSES
ASD RELAY OUTPUT CIRCUIT(S) OPEN
ECM GROUND CIRCUIT(S) OPEN
FUSED ASD RELAY BATTERY SUPPLY CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the ECM harness connectors. Using a 12-volt test light connected to 12-volts, check both of the ECM ground circuits in ECM harness connector C1 cavities 1 and 2. Did the test light illuminate for both cavities? Yes → Go To 2 No → Repair the ECM Ground circuit(s) for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
2	Turn the ignition off. Disconnect the ECM harness connectors. Turn the ignition on. Using a 12-volt test light connected to ground, check the Fused Ignition Switch Output circuit in ECM harness connector C1 cavity 22. Is the test light on? Yes → Go To 3 No → Repair the Fused Ignition Switch Output circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
3	Turn the ignition off. Remove the ASD Relay from the PDC. Using a 12-volt test light connected to ground, check the Fused ASD Relay Battery Supply circuit in ASD Relay connector cavity 30. Is the test light on? Yes → Go To 4 No → Repair the Fused ASD Relay Battery Supply circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
4	Turn the ignition off. Disconnect the ECM harness connectors. Remove the ASD Relay from the PDC. Connect a jumper wire between cavity 30 and cavity 87 in the ASD Relay connector. Using a 12-volt test light connected to ground, check the ASD Relay Output circuit in ECM harness connector C1 cavities 4 and 5. Did the test light illuminate for both circuits? Yes → Test Complete. No → Repair the ASD Relay Output circuit(s) for an open. Perform ROAD TEST VERIFICATION - VER-2.	All

Symptom:
*CHECKING THE EGR SYSTEM

POSSIBLE CAUSES
EGR VALVE
CHECKING VACUUM SUPPLY
EGR SOLENOID

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect both vacuum lines at the EGR Solenoid. Using a vacuum line connection tee, connect the vacuum supply line to the EGR Solenoid Output line at the EGR Solenoid. Disconnect the vacuum line at the EGR Valve. Connect a vacuum gauge to the EGR Solenoid Output line at the EGR Valve. Start the engine. With the engine at idle, note the vacuum gauge reading. Is the vacuum above 22 inches? Yes → Go To 2 No → Inspect the vacuum hoses/tubes for damage, restriction and leaks. If o.k. refer to the Service Information to check the Vacuum Pump operation. Perform ROAD TEST VERIFICATION - VER-2.	All
2	**NOTE: The engine must be at operating temperature for this test to be valid.** Turn the ignition off. Disconnect the vacuum line at the EGR Valve. Connect a vacuum gauge to the EGR Solenoid Output line at the EGR Valve Start the engine and observe the vacuum gauge reading for 1 minute. **NOTE: The vacuum reading should increase to above 18 inches approximately 5 seconds after the engine is started. The vacuum should decrease to below 4 inches within 40 seconds of engine run time.** Did the vacuum reading increase to above 18 inches then decrease below 4 inches as described? Yes → Go To 3 No → Replace the EGR Solenoid. Perform ROAD TEST VERIFICATION - VER-2.	All
3	Turn the ignition off. Disconnect both vacuum lines at the EGR Solenoid. Using a vacuum line connection tee, connect the vacuum supply line to the EGR Solenoid Output line at the EGR Solenoid. Test drive the vehicle and note the vehicles performance. **NOTE: With the connection tee in place the EGR valve will receive full vacuum supply with the engine running. This should cause a severe reduction in engine power.** Does the vehicle exhibit a severe loss of power? Yes → Test Complete. No → Replace the EGR Valve. Perform ROAD TEST VERIFICATION - VER-2.	All

Symptom:
*CHECKING THE ENGINE COOLANT TEMPERATURE SENSOR CALIBRATION

POSSIBLE CAUSES
ECT SENSOR - COLD
ECT SENSOR - HOT

TEST	ACTION	APPLICABILITY
1	**NOTE: The thermostat must be operating correctly for this test to be valid.** With the DRBIII® in Sensors, read and note the engine coolant temperature. Using a temperature probe, measure the engine block temperature near the ECT Sensor. **NOTE: The engine temperature should be below 50°C (120°F).** Are the readings within 7°C (13°F) of each other? Yes → Go To 2 No → Replace the Engine Coolant Temperature Sensor. Perform ROAD TEST VERIFICATION - VER-2.	All
2	**NOTE: The thermostat must be operating correctly for this test to be valid.** Start the engine and bring the engine to operating temperature (thermostat open). Turn the engine off and wait 10 minutes to allow the engine temperature to stabilize. Using a temperature probe, measure the engine block temperature near the ECT Sensor. With the DRBIII®, select Engine, then Sensors and read the engine coolant temperature. Are the readings within 7°C (13°F) of each other? Yes → Test Complete. No → Replace the Engine Coolant Temperature Sensor. Perform ROAD TEST VERIFICATION - VER-2.	All

Symptom:
*CHECKING THE ENGINE MECHANICAL SYSTEMS

POSSIBLE CAUSES
CHECKING ENGINE MECHANICAL SYSTEMS

TEST	ACTION	APPLICABILITY
1	**NOTE: The following items should be checked as a possible cause of a Driveability or No-Start problem.** **WARNING: Do not attempt to remove or separate high pressure fuel line. Attempting to do so could result in severe bodily injury or death.** Engine Valve Timing - must be within specification Engine Compression - must be within specifications Camshaft Lobes - check for abnormal wear Camshaft Position Sensor - check the camshaft position sensor tooth for debris and deterioration Crankshaft Position Sensor - check the crankshaft tone wheel for debris and deterioration Engine Exhaust System - must be free of any restriction Engine Drive Chain and Sprockets - must be properly positioned Vacuum System - must operate properly and be free of any vacuum leaks Fuel - must have adequate supply and must be free of contamination (ie. debris, water and gasoline) Fuel Injectors - must not be plugged or restricted Fuel Lift Pump - must operate properly (where applicable) Fuel Injection Pump - must be producing the correct output volume and pressure Inspect the Fuel Lines, Fuel Filter and Fuel Pressure Relief Valve for signs of restriction and leaks **NOTE: Check for any Technical Service Bulletins that may relate to the problem.** Are there any problems evident? Yes → Repair as necessary. Perform ROAD TEST VERIFICATION - VER-2. No → Test Complete.	All

Symptom:

*CHECKING THE GLOW PLUG OPERATION

POSSIBLE CAUSES
CHECKING THE GLOW PLUGS
FUSED B+ CIRCUIT OPEN
GLOW PLUG RELAY OUTPUT CIRCUIT SHORTED TO VOLTAGE
GLOW PLUG RELAY OUTPUT CIRCUIT SHORTED TO GROUND
GLOW PLUG RELAY OUTPUT CIRCUIT OPEN
GLOW PLUG RELAY

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the Glow Plug harness connectors for all cylinders. Turn the ignition on. With the DRBIII®, actuate the Glow Plug 1 Relay. Using a 12-volt test light connected to ground, probe Glow Plug harness connectors 1, 3 and 5 during actuator test. With the DRBIII®, actuate the Glow Plug 2 Relay. Using a 12-volt test light connected to ground, probe Glow Plug harness connectors 2 and 4 during actuator test. Does the test light cycle on and off at each Glow Plug harness connector during actuation? Yes → Go To 2 No → Go To 3	All
2	Refer to the Service Information and perform the Glow Plug Test. Are all Glow Plugs operating properly? Yes → Test Complete. No → Replace the Glow Plug(s) as necessary. Perform ROAD TEST VERIFICATION - VER-2.	All
3	**NOTE: If the Glow Plug Relay fuse or fuselink is open, refer to the system schematics for all circuits that are powered by the Glow Plug Relay fuse or fuselink to determine the cause of the blown fuse/fuselink.** Remove the Glow Plug Relay of the affected cylinder(s). Using a 12-volt test light connected to ground, probe the Fused B+ circuit in the Glow Plug Relay connector. Does the test light illuminate brightly? Yes → Go To 4 No → Repair the Fused B+ (Fuse/Fuselink) circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All

*CHECKING THE GLOW PLUG OPERATION — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the Glow Plug harness connectors of the affected cylinder(s). Remove the Glow Plug Relay of the affected cylinder(s). Turn the ignition on. Measure the voltage on the Glow Plug Relay Output circuit of the affected cylinder(s). Is the voltage above 1.0 volt? Yes → Repair the Glow Plug Relay Output circuit for a short to voltage. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 5	All
5	Turn the ignition off. Disconnect the Glow Plug harness connectors of the affected cylinder(s). Remove the Glow Plug Relay of the affected cylinder(s). Measure the resistance between ground and the Glow Plug Relay Output circuit of the affected cylinder(s). Is the resistance above 100 kohms? Yes → Go To 6 No → Repair the Glow Plug Relay Output circuit for a short to ground. Inspect the fuse or fuselink and replace as necessary. Perform ROAD TEST VERIFICATION - VER-2.	All
6	Turn the ignition off. Disconnect the Glow Plug harness connectors of the affected cylinder(s). Remove the Glow Plug Relay of the affected cylinder(s). Connect a jumper wire across Glow Plug Relay connector cavities 30 and 87. Using a 12-volt test light connected to ground, check the Glow Plug Relay Output circuit at the Glow Plug harness connectors of the affected cylinder(s). Is the test light on at each Glow Plug harness connector? Yes → Go To 7 No → Repair the Glow Plug Relay Output circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
7	If there are no possible causes remaining, view repair. Repair Replace the Glow Plug Relay of the affected cylinder(s). Perform ROAD TEST VERIFICATION - VER-2.	All

Symptom:
*CHECKING THE PARK NEUTRAL SWITCH SIGNAL

POSSIBLE CAUSES
CHECK FOR TRANSMISSION CONTROL MODULE DTCS
ENGINE CONTROL MODULE
P/N SENSE CIRCUIT SHORTED TO VOLTAGE
P/N SWITCH SENSE CIRCUIT OPEN
P/N SWITCH SENSE CIRCUIT SHORTED TO GROUND

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read Transmission DTCs. Are any TCM DTCs present? Yes → Refer to the Transmission Diagnostics Information for related symptom(s). Perform ROAD TEST VERIFICATION - VER-2. No → Go To 2	All
2	Turn the ignition off. Disconnect the TCM harness connector. Turn the ignition on. With the DRBIII® in Engine Inputs/Outputs, read the P/N Switch state. Connect one end of a fused jumper wire to the P/N Switch Sense circuit at the TCM harness connector. Connect the other end of the jumper to ground for 10 seconds then disconnect from ground. Does the DRB Switch state change when connecting and disconnecting from ground? Yes → Test Complete. No → Go To 3	All
3	Turn the ignition off. Disconnect the TCM harness connector. Disconnect the ECM harness connectors. Remove the ASD Relay from the PDC. Connect a jumper wire between cavities 30 and 87 in the ASD connector in the PDC. Turn the ignition on. Measure the voltage of the P/N Switch Sense circuit. Is the voltage above 1.0 volt? Yes → Repair the Park/Neutral Switch Sense circuit for a short to voltage. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 4	All

*CHECKING THE PARK NEUTRAL SWITCH SIGNAL — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the TCM harness connector. Disconnect the ECM harness connectors. Measure the resistance of the P/N Switch Sense circuit. Is the resistance below 10.0 ohms? Yes → Go To 5 No → Repair the Park/Neutral Position Sense circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
5	Turn the ignition off. Disconnect the TCM harness connector. Disconnect the ECM harness connectors. Measure the resistance between ground and the P/N Switch Sense circuit. Is the resistance above 1000.0 ohms? Yes → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2. No → Repair the P/N Switch Sense circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.	All

Symptom:
*CHECKING THE SPEED CONTROL OPERATION

POSSIBLE CAUSES
BRAKE SWITCH SIGNAL
ECM DTC(S) PRESENT
ENGINE CONTROL MODULE
SPEED CONTROL SWITCHES
VSS SIGNAL
INTERMITTENT CONDITION

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read the ECM DTCs. Are there any ECM DTCs present? Yes → Refer to symptom list for problems related to the ECM DTC. Perform SPEED CONTROL VERIFICATION - VER-4. No → Go To 2	All
2	Start the engine. With the DRBIII®, read the S/C SWITCH VOLTS. Observe the S/C Switch volts on the DRBIII® while pressing and holding each S/C Switch button separately. **NOTE: Pressing each S/C Switch button should result in the following voltages: ON/OFF 0.55v - 1.15, SET 3.0 - 3.6v, RESUME/ACCEL 3.9 - 4.2v, CANCEL 1.2 - 2.05v, COAST 2.2 - 2.95v, No Button Pressed 4.4 - 4.7v** Does each switch provide the correct voltage? Yes → Go To 3 No → Refer to symptom list for problems related to S/C Switches. Perform SPEED CONTROL VERIFICATION - VER-4.	All
3	Test drive the vehicle above 60 km/h (35 MPH). Attempt to Set the Speed Control. Does the Speed Control function properly? Yes → Test Complete. No → Go To 4	All
4	Turn the ignition on. With the DRBIII® in Sensors, read Vehicle Speed. Have an assistant drive the vehicle while you are observing the Vehicle Speed on the DRBIII®. While observing vehicle speed on the DRBIII®, note any rapid changes (signal dropouts) in the reading that do not correspond with actual vehicle speed. Is the DRBIII® displaying an accurate vehicle speed? Yes → Go To 5 No → Refer to symptom list for problems related to the Vehicle Speed Sensor. Perform SPEED CONTROL VERIFICATION - VER-4.	All

*CHECKING THE SPEED CONTROL OPERATION — Continued

TEST	ACTION	APPLICABILITY
5	Turn the ignition on. With the DRBIII® in Inputs/Outputs, read the Primary and Secondary brake switch states while pressing and releasing the Brake Pedal several times. Did the DRBIII® indicate the correct brake pedal state when pressing and releasing the Brake Pedal? Yes → Go To 6 No → Refer to symptom list for problems related to Brake Switch Signal. Perform SPEED CONTROL VERIFICATION - VER-4.	All
6	**WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.** Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary. Perform SPEED CONTROL VERIFICATION - VER-4. No → Replace and program the Engine Control Module in accordance with the Service Information. Perform SPEED CONTROL VERIFICATION - VER-4.	All

Symptom:
*CHECKING THE TRANSFER CASE POSITION SENSOR

POSSIBLE CAUSES
CHECKING THE TRANSFER CASE POSITION SENSOR

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII® read the T-case Sensor Observe the T-case volts on the DRB while moving the transfer case selector lever in each of the transfer case positions. **NOTE: When shifting the transfer case selector to each position, the Sensor voltage should result in the following voltages: 4WD Full Time 1.24 - 1.55, 4WD Low 0.16 - 0.40, Neutral 0.68 - 0.97.** Does each position provide the correct voltage? Yes → Test Complete. No → Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Transfer Case Position Sensor and the ECM. If wiring and connectors are ok, replace the Transfer Case Position Sensor. Perform ROAD TEST VERIFICATION - VER-2.	All

Symptom:
*CHECKING THE VISCOUS/CABIN HEATER RELAY

POSSIBLE CAUSES
FUSED B+ CIRCUIT OPEN
VISCOUS HEATER RELAY OUTPUT CIRCUIT SHORTED TO VOLTAGE
VISCOUS HEATER RELAY OUTPUT CIRCUIT SHORTED TO GROUND
VISCOUS HEATER RELAY OUTPUT CIRCUIT OPEN
VISCOUS HEATER RELAY

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, actuate the Viscous Heater Relay. Is the clicking during the actuator test? Yes → Test Complete. No → Go To 2	All
2	**NOTE: If the Viscous Heater Relay fuse or fuselink is open, refer to the system schematics for all circuits that are powered by the Cabin Heater Relay fuse or fuselink to determine the cause of the blown fuse/fuselink.** Remove the Viscous Heater Relay. Using a 12-volt test light connected to ground, probe the Fused B+ circuit in the Viscous Heater Relay connector. Does the test light illuminate brightly? Yes → Go To 3 No → Repair the Fused B+ (Fuse/Fuselink) circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
3	Turn the ignition off. Disconnect the Viscous Heater harness connector. Remove the Viscous Heater Relay. Turn the ignition on. Measure the voltage on the Viscous Heater Relay Output circuit. Is the voltage above 1.0 volt? Yes → Repair the Viscous Heater Relay Output circuit for a short to voltage. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 4	All
4	Turn the ignition off. Disconnect the Viscous Heater harness connector. Remove the Viscous Heater Relay. Measure the resistance between ground and the Viscous Heater Relay Output circuit. Is the resistance above 1000 ohms? Yes → Go To 5 No → Repair the Viscous Heater Relay Output circuit for a short to ground. Inspect the fuse or fuselink and replace as necessary. Perform ROAD TEST VERIFICATION - VER-2.	All

*CHECKING THE VISCOUS/CABIN HEATER RELAY — Continued

TEST	ACTION	APPLICABILITY
5	Turn the ignition off. Disconnect the Viscous Heater harness connector. Remove the Viscous Heater Relay. Connect a jumper wire across Viscous Heater Relay connector cavities 30 and 87. Using a 12-volt test light connected to ground, check the Viscous Heater Relay Output circuit in the Viscous Heater harness connector. Does the test light illuminate brightly? Yes → Go To 6 No → Repair the Viscous Heater Relay Output circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
6	If there are no possible causes remaining, view repair. Repair Replace the Viscous Heater Relay. Perform ROAD TEST VERIFICATION - VER-2.	All

Symptom:
*CHECKING THE WATER IN FUEL LAMP OPERATION

POSSIBLE CAUSES
ASD RELAY OUTPUT CIRCUIT OPEN
ECM
SENSOR GROUND CIRCUIT OPEN
VERIFY WIF INDICATOR OPERATION
WATER IN FUEL SENOR SIGNAL CIRCUIT OPEN
WATER IN FUEL SENOR SIGNAL CIRCUIT SHORTED TO GROUND
WATER IN FUEL SENOR SIGNAL CIRCUIT SHORTED TO SENSOR GROUND
WATER IN FUEL SENSOR

TEST	ACTION	APPLICABILITY
1	Perform the Instrument Cluster Self-Test to verify proper WIF Indicator operation. Did the WIF Indicator operate correctly during Self-Test? Yes → Go To 2 No → Test Complete.	All
2	Turn the ignition off. Disconnect the WIF Sensor harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, check the ASD Relay Output circuit at the WIF Sensor harness connector. Does the test light illuminate brightly? Yes → Go To 3 No → Repair the ASD Relay Output circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
3	Turn the ignition off. Disconnect the Water In Fuel Sensor harness connector. Turn the ignition on. With the DRB, read the Water In Fuel Switch state. Connect a jumper wire across the Water In Fuel Sensor harness connector cavities 1 and 2 for 10 seconds then disconnect the jumper. **NOTE: The DRB display should read CLOSED with the jumper connected and OPEN when the jumper is not connected.** Does the DRB Display switch between OPEN and CLOSED as described? Yes → The WIF Sensor circuitry and the ECM are functioning properly. If there is still a WIF indicator problem replace the Water In Fuel Sensor. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 4	All

*CHECKING THE WATER IN FUEL LAMP OPERATION — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the Water In Fuel Sensor harness connector. Disconnect the ECM harness connectors. Measure the resistance of the Water In Fuel Sensor Signal circuit. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Water In Fuel Sensor Signal circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
5	Turn the ignition off. Disconnect the Water In Fuel Sensor harness connector. Disconnect the ECM harness connectors. Measure the resistance of the Sensor Ground circuit. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the Sensor Ground circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
6	Turn the ignition off. Disconnect the Water In Fuel Sensor harness connector. Disconnect the ECM harness connectors. Measure the resistance between ground and the Water In Fuel Sensor Signal circuit. Is the resistance below 1000.0 ohms? Yes → Go To 7 No → Repair the Water In Fuel Sensor Signal circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.	All
7	Turn the ignition off. Disconnect the Water In Fuel Sensor harness connector. Disconnect the ECM harness connectors. Measure the resistance between Sensor Ground and the Water In Fuel Sensor Signal circuit at the WIF Sensor harness connector. Is the resistance below 1000.0 ohms? Yes → Repair the Water In Fuel Sensor Signal circuit for a short to Sensor Ground. Perform ROAD TEST VERIFICATION - VER-2. No → Test Complete.	All

Symptom:
*ENGINE CRANKS BUT WILL NOT START

POSSIBLE CAUSES
CHECK CAMSHAFT POSITION SENSOR SIGNAL
CHECK CRANKSHAFT POSITION SENSOR SIGNAL
CHECKING FOR ECM CODES
CHECKING FOR SKIM CODES
CHECKING THE ECT SENSOR
CHECKING THE GLOW PLUG OPERATION
ENGINE CONTROL MODULE
ENGINE DRIVE GEAR/SPROCKET
FUEL INJECTOR DRIVER CIRCUIT(S) SHORTED TO GROUND
FUEL PRESSURE SENSOR
FUEL PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT OPEN
FUEL PRESSURE SENSOR SIGNAL CIRCUIT OPEN
FUEL SUPPLY CONTAMINATION
FUEL SYSTEM PRESSURE MECHANICAL
FUEL SYSTEM RESTRICTION
SENSOR GROUND OPEN

TEST	ACTION	APPLICABILITY
1	**NOTE: The ECM must have proper power and ground connections for the following tests to be valid. Refer to Checking the ECM Power and Grounds in the symptom list.** Turn the ignition on. With the DRBIII®, read the ECM DTCs. Does the DRBIII® display any ECM DTCs? Yes → Refer to symptom list for problems related to ECM DTC. Perform NO START VERIFICATION - VER-1. No → Go To 2	All
2	Turn the ignition on. With the DRBIII®, read the SKIM DTCs. Does the DRBIII® display any SKIM DTCs? Yes → Refer to symptom list for problems related to SKIM DTC. Perform NO START VERIFICATION - VER-1. No → Go To 3	All

*ENGINE CRANKS BUT WILL NOT START — Continued

TEST	ACTION	APPLICABILITY
3	Using a temperature probe, check the vehicle temperature near the ECT Sensor. Turn the ignition on. With the DRBIII® in Sensors, read the ECT Sensor temperature. Compare the temperature probe reading with the DRBIII® reading. Are the two readings within 10°C of each other? Yes → Go To 4 No → Repair as necessary. Perform NO START VERIFICATION - VER-1.	All
4	**NOTE: Prior to performing this test, be sure to check the Glow Plug Relay operation. Refer to CHECKING GLOW PLUG OPERATION for the related symptom(s).** Refer to the Service Information and check the Glow Plugs for proper operation. Are the Glow Plugs operating properly? Yes → Go To 5 No → Repair as necessary. Perform NO START VERIFICATION - VER-1.	All
5	Turn the ignition off. Disconnect the ECM harness connectors. Disconnect all 5 Fuel Injector harness connectors. Measure the resistance between Ground and each Fuel Injector Driver circuit at it's respective Fuel Injector harness connector. Is the resistance below 1000 ohms for any of the measurements? Yes → Repair the Fuel Injector Driver circuit(s) for a short to ground. Perform NO START VERIFICATION - VER-1. No → Go To 6	All
6	Inspect the fuel system lines for restrictions, leaks or other problems. Is there any evidence of problems? Yes → Repair as necessary. Perform NO START VERIFICATION - VER-1. No → Go To 7	All
7	Turn the ignition off. Using the DRBIII® lab scope, backprobe the CMP Sensor Signal circuit at the ECM harness connector. Start the engine, if the engine will not start, crank the engine for several seconds while monitoring the DRBIII®. **NOTE: Refer to Charts and Graphs to view a correct CMP Sensor signal.** Does the DRBIII® display a steady clean CMP Signal pattern? Yes → Go To 8 No → Perform Test for DTC P0340-Camshaft Position Sensor Circuit Static Plausibility. Perform NO START VERIFICATION - VER-1.	All

*ENGINE CRANKS BUT WILL NOT START — Continued

TEST	ACTION	APPLICABILITY
8	Turn the ignition off. Using the DRBIII® lab scope, backprobe both of the CKP Sensor Signal circuits at the ECM harness connector. **NOTE: Refer to Charts and Graphs to view a correct CKP Sensor signal.** Start the engine, if the engine will not start, crank the engine for several seconds while monitoring the DRBIII®. Does the DRBIII® display a steady clean CKP Signal pattern for each circuit? Yes → Go To 9 No → Perform Test for DTC P0340-Crankshaft Position Sensor Circuit Dynamic Plausibility. Perform NO START VERIFICATION - VER-1.	All
9	Refer to the Service Information and perform the fuel pressure test. Is the fuel pressure within specification? Yes → Go To 10 No → Repair as necessary. Perform NO START VERIFICATION - VER-1.	All
10	Refer to the Service Information and perform the fuel pressure test. Note the test results. Using the DRBIII®, read the Fuel Pressure and compare the two readings. Are the two readings within 3450 kPa (500 PSI) of each other? Yes → Go To 11 No → Go To 13	All
11	Refer to the Service Information to ensure the Engine Drive Gears/Sprocket are installed correctly and the camshaft and crankshaft gears are timed correctly. Were any problems found? Yes → Repair as necessary. Perform NO START VERIFICATION - VER-1. No → Go To 12	All
12	Inspect the fuel supply for contamination. Is the fuel contaminated? Yes → Check the fuel supply for contamination. Perform NO START VERIFICATION - VER-1. No → Replace and program the Engine Control Module in accordance with the Service Information. Perform NO START VERIFICATION - VER-1.	All
13	Turn the ignition off. Disconnect the Fuel Pressure Sensor harness connector. Disconnect the ECM harness connectors. Measure the resistance of the Fuel Pressure Sensor Signal circuit. Is the resistance below 10.0 ohms? Yes → Go To 14 No → Repair the Fuel Pressure Sensor Signal circuit for an open. Perform NO START VERIFICATION - VER-1.	All

*ENGINE CRANKS BUT WILL NOT START — Continued

TEST	ACTION	APPLICABILITY
14	Turn the ignition off. Disconnect the Fuel Pressure Sensor harness connector. Disconnect the ECM harness connectors. Measure the resistance of the Fuel Pressure Sensor 5-volt Supply circuit. Is the resistance below 10.0 ohms? Yes → Go To 15 No → Repair the Fuel Pressure Sensor 5-volt Supply circuit for an open. Perform NO START VERIFICATION - VER-1.	All
15	Turn the ignition off. Disconnect the Fuel Pressure Sensor harness connector. Disconnect the ECM harness connectors. Measure the resistance of the Sensor Ground circuit. Is the resistance below 10.0 ohms? Yes → Replace the Fuel Pressure Sensor in accordance with the Service Information. Perform NO START VERIFICATION - VER-1. No → Repair the Sensor Ground circuit for an open. Perform NO START VERIFICATION - VER-1.	All

Symptom:
*ENGINE WILL NOT CRANK

POSSIBLE CAUSES
BATTERY CABLE HIGH RESISTANCE
CHECKING FOR SKIM OR TCM CODES
ECM
INSPECT BATTERY CABLES
MECHANICAL PROBLEM
OPEN FUSED BATTERY (+) CIRCUIT
OPEN IGNITION SWITCH START CIRCUIT
OPEN IGNITION SWITCH START OUTPUT AT THE ECM
STARTER MOTOR
STARTER RELAY
STARTER RELAY CONTROL CIRCUIT OPEN
STARTER RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
STARTER RELAY OUTPUT CIRCUIT OPEN
VERIFY PARK/NEUTRAL SIGNAL

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. **NOTE: The battery must be fully charged before diagnosing a no crank condition.** Inspect the battery cables for corrosion, looseness or other problems. Is there evidence of problems? Yes → Repair as necessary. Perform NO START VERIFICATION - VER-1. No → Go To 2	All
2	Turn the ignition on. With the DRBIII®, read the SKIM and TCM DTCs. Does the DRBIII® display any SKIM or TCM DTCs? Yes → Refer to symptom list for problems related to SKIM or TCM. Perform NO START VERIFICATION - VER-1. No → Go To 3	All
3	Turn the ignition on. With the DRBIII® in Engine, Inputs/Outputs, read the P/N Switch state while moving the gear selector between Park and reverse. Does the P/N Switch state change when moving the gear selector? Yes → Go To 4 No → Refer to symptom list for problems related to Park/Neutral Switch Signal. Perform NO START VERIFICATION - VER-1.	All

*ENGINE WILL NOT CRANK — Continued

TEST	ACTION	APPLICABILITY
4	**WARNING: The transmission must be in Neutral and the parking break must be engaged for this test.** **WARNING: The engine may be cranked in this test. Keep away from moving engine parts.** Turn the ignition off. Remove the Starter Relay from the PDC. Briefly connect a jumper wire between the Starter Relay Output circuit and the Fused B+ circuit at the starter relay connector in the PDC. Did the engine crank? Yes → Go To 5 No → Go To 10	All
5	Turn the ignition off. Remove the Starter Relay from the PDC. Install a substitute relay in place of the Starter Relay. Attempt to start the engine. Does the engine crank? Yes → Replace the Starter Relay. Perform NO START VERIFICATION - VER-1. No → Go To 6	All
6	Remove the Starter Relay from the PDC. Using a 12-volt test light connected to ground, check the Ignition Switch Start circuit while turning the ignition switch to the START position. Does the test light illuminate with the ignition switch in the START position? Yes → Go To 7 No → Repair the Ignition Switch Start circuit for an open. Perform NO START VERIFICATION - VER-1.	All
7	Turn the ignition off. Disconnect the ECM harness connectors. Remove the Starter Relay from the PDC. Remove the ASD Relay from the PDC. Using a jumper wire, connect ASD Relay connector cavities 30 and 87 in the PDC. Turn the ignition on. Measure the voltage of the Starter Relay Control circuit. Is the voltage above 1.0 volt? Yes → Repair the Starter Relay Control circuit for a short to voltage. Perform NO START VERIFICATION - VER-1. No → Go To 8	All
8	Turn the ignition off. Disconnect the ECM harness connectors. Remove the Starter Relay from the PDC. Measure the resistance of the Starter Relay Control circuit. Is the resistance below 10.0 ohms? Yes → Go To 9 No → Repair the Starter Relay Control circuit for an open. Perform NO START VERIFICATION - VER-1.	All

*ENGINE WILL NOT CRANK — Continued

TEST	ACTION	APPLICABILITY
9	Using a 12-volt test light connected to ground, check the Ignition Switch Start Output circuit at ECM C1 harness connector cavity 22 while turning the ignition switch to the START position. Does the test light illuminate with the ignition switch in the START position? Yes → Replace and program the Engine Control Module in accordance with the Service Information. Perform NO START VERIFICATION - VER-1. No → Repair the Ignition Switch Start Output circuit at the ECM harness connector for an open. Perform NO START VERIFICATION - VER-1.	All
10	Remove the Starter Relay from the PDC. Using a 12-volt test light connected to ground, check the Fused B+ circuit in the Starter Relay connector in the PDC. Is the test light on? Yes → Go To 11 No → Repair the Fused B(+) circuit for an open. Perform NO START VERIFICATION - VER-1.	All
11	Turn the ignition off. Remove the Starter Relay from the PDC. Disconnect the Starter Relay Output wire from the Starter Solenoid. Connect the Starter Relay Output wire (at the Starter) to ground. Using a 12-volt test light connected to 12-volts, check the Starter Relay Output circuit at the Starter Relay connector in the PDC. Does the test light illuminate brightly? Yes → Go To 12 No → Repair the Starter Relay Output circuit for an open. Perform NO START VERIFICATION - VER-1.	All
12	Using the Service Information, check the battery cables for high resistance. Did either battery cable have a voltage drop greater than 0.2 volts? Yes → Replace the battery cable(s). Perform NO START VERIFICATION - VER-1. No → Go To 13	All
13	Turn the ignition off. Attempt to manually rotate the crankshaft 360°. Is the crankshaft able to rotate 360°? Yes → Replace the Starter Motor. Perform NO START VERIFICATION - VER-1. No → Repair the engine mechanical problem. Perform NO START VERIFICATION - VER-1.	All

Symptom List:

- **ANTENNA FAILURE**
- **COP FAILURE**
- **EEPROM FAILURE**
- **INTERNAL FAULT**
- **RAM FAILURE**
- **SERIAL LINK INTERNAL FAULT**
- **STACK OVERFLOW FAILURE**

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be ANTENNA FAILURE.

When Monitored and Set Condition:

ANTENNA FAILURE

When Monitored: Every 250 milliseconds with the ignition on.

Set Condition: The SKIM's microcontroller determines that an antenna circuit fault has occurred for 2.0 consecutive seconds.

COP FAILURE

When Monitored: With the ignition on.

Set Condition: The COP timer is not reset by the micro controller every 65.5 milliseconds.

EEPROM FAILURE

When Monitored: With the ignition on.

Set Condition: When the value written to EEPROM memory does not equal the value read back after the write operation.

INTERNAL FAULT

When Monitored: With the ignition on.

Set Condition: The SKIM has detected a fault during an internal self test.

RAM FAILURE

When Monitored: With the ignition on.

Set Condition: The RAM fails a test that checks the RAM's ability to retain memory.

SERIAL LINK INTERNAL FAULT

When Monitored: With the ignition on.

Set Condition: The SKIM fails an internal J1850 communication self test.

STACK OVERFLOW FAILURE

When Monitored: With the ignition on.

Set Condition: The micro controller has exceeded its stack space limit.

ANTENNA FAILURE — Continued

POSSIBLE CAUSES
SKIM INTERNAL DTC FAILURE

TEST	ACTION	APPLICABILITY
1	**Note: This trouble code indicates an internal SKIM fault.** With the DRBIII®, read and record the SKIM DTCs and then erase the SKIM DTCs Perform 10 ignition key cycles, leaving the ignition key on for a minimum of 90 seconds per cycle. With the DRBIII® , read the SKIM DTCs. Did the same SKIM DTC return? Yes → Replace and program the Sentry Key Immobilizer Module in accordance with the Service Information. Perform SKIS VERIFICATION. No → Test Complete.	All

Symptom List:
PCM STATUS FAILURE
SERIAL LINK EXTERNAL FAULT

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be PCM STATUS FAILURE.

When Monitored and Set Condition:

PCM STATUS FAILURE

When Monitored: With the ignition on.

Set Condition: This DTC exists when a PCM STATUS message was not received from the PCM for at least 20.0 consecutive seconds.

SERIAL LINK EXTERNAL FAULT

When Monitored: At ignition on, after ignition on during any rolling code handshake that occurs with the ECM due to a SKIM reset, or during SECRET KEY transfers to the ECM.

Set Condition: When the SKIM does not receive an expected PCI BUS message transmission acknowledgement from the ECM after 3 transmit attempts.

POSSIBLE CAUSES
INTERMITTENT WIRING HARNESS PROBLEM
WIRING HARNESS INSPECTION
SKIM/ECM

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure the ECM has proper power and ground connections before continuing.** With the DRBIII®, read and record the SKIM DTCs then erase the SKIM DTCs. Turn the ignition off. Wait 2 minutes. Turn the ignition on. With the DRBIII®, read the SKIM DTCs. Does the DRBIII® display the DTC that was previously erased? Yes → Go To 2 No → Go To 4	All

PCM STATUS FAILURE — Continued

TEST	ACTION	APPLICABILITY
2	Turn the ignition off. **NOTE: Visually inspect the related wiring harness and CCD/PCI Bus (whichever applicable) circuits. Look for any chafed, pierced, pinched, or partially broken wires.** **NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.** **Note: Refer to any Technical Service Bulletins (TSB) that may apply.** Were any problems found? Yes → Repair as necessary. Perform SKIS VERIFICATION. No → Go To 3	All
3	**NOTE: Before proceeding it will be necessary to obtain the SKIM PIN.** Turn the ignition on. With the DRBIII®, display and erase all ECM and SKIM DTC's. Perform 5 ignition key cycles, leaving the ignition key on for a minimum of 90 seconds per cycle. With the DRBIII®, read the SKIM DTCs. Does the code appear? Yes → Replace and program the Engine Control Module in accordance with the Service Information. Perform SKIS VERIFICATION. No → Test Complete.	All
4	Turn the ignition off. **Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.** **NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.** **Note: Refer to any Technical Service Bulletins (TSB) that may apply.** Were any problems found? Yes → Repair wiring harness/connectors as necessary. Perform SKIS VERIFICATION. No → Test Complete.	All

Symptom List:
ROLLING CODE FAILURE
VIN MISMATCH

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be ROLLING CODE FAILURE.

When Monitored and Set Condition:

ROLLING CODE FAILURE

When Monitored: At ignition on, after ignition on during any rolling code handshake that occurs with the ECM due to a SKIM or ECM reset.

Set Condition: When a PCM STATUS message with a Valid Key status is not received by the SKIM within 3.5 seconds of transmitting the last Valid Key Code message to the ECM.

VIN MISMATCH

When Monitored: With the ignition on.

Set Condition: When the VIN received from the ECM does not match the VIN stored in the SKIM's EEPROM.

POSSIBLE CAUSES
VERIFYING ECM VIN
REPLACE SKIM AND CHECK DTC'S
INTERMITTENT WIRING HARNESS PROBLEM
ECM

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase the SKIM DTCs. Turn the ignition off. Wait 10 seconds. Turn the ignition on and wait 2 minutes. With the DRBIII®, read the SKIM DTCs. Does the DRBIII® display the DTC that was previously erased? Yes → Go To 2 No → Go To 4	All

ROLLING CODE FAILURE — Continued

TEST	ACTION	APPLICABILITY
2	Turn the ignition on. With the DRBIII®, select Engine system from the main menu. Display and record the Vehicle Identification Number. **NOTE: Ensure that a VIN has been programmed into the ECM. If a VIN is not displayed, attempt to program the ECM with the correct vehicle VIN before continuing.** Does the VIN recorded from the ECM match the VIN of the vehicle? Yes → Go To 3 No → Replace and program the Engine Control Module in accordance with the Service Information. Perform SKIS VERIFICATION.	All
3	Turn the ignition off. Replace and program the Sentry Key Immobilizer Module in accordance with the Service Information. Turn the ignition on. With the DRBIII®, display and clear all ECM and SKIM DTC's. Perform 5 ignition key cycles leaving the ignition key on for 90 seconds per cycle. With the DRBIII®, check for SKIM DTCs. Does the DRBIII® display the same DTC? Yes → Replace and program the Engine Control Module in accordance with the Service Information. Perform SKIS VERIFICATION. No → The repair is complete. Perform SKIS VERIFICATION.	All
4	Turn the ignition off. **Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.** **NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.** **Note: Refer to any Technical Service Bulletins (TSB) that may apply.** Were any problems found? Yes → Repair wiring harness/connectors as necessary. Perform SKIS VERIFICATION. No → Test Complete.	All

Symptom List:

TRANSPONDER COMMUNICATION FAILURE
TRANSPONDER CYCLIC REDUNDANCY CHECK (CRC) FAILURE
TRANSPONDER ID MISMATCH
TRANSPONDER RESPONSE MISMATCH

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be TRANSPONDER COMMUNICATION FAILURE.

When Monitored and Set Condition:

TRANSPONDER COMMUNICATION FAILURE

When Monitored: At ignition on and during Key Programming Mode.

Set Condition: When the SKIM does not receive a transponder response after 8 consecutive transponder read attempts within 2.0 seconds.

TRANSPONDER CYCLIC REDUNDANCY CHECK (CRC) FAILURE

When Monitored: At ignition on and during Key Programming Mode.

Set Condition: When 5 consecutive transponder signal transmissions are sent to the SKIM with the correct message format but with invalid data.

TRANSPONDER ID MISMATCH

When Monitored: At ignition on and during Key Programming Mode.

Set Condition: When the transponder ID read by the SKIM does not match any of the transponder ID's stored in the SKIM's memory.

TRANSPONDER RESPONSE MISMATCH

When Monitored: At ignition on and during Key Programming Mode.

Set Condition: When the transponder's crypto algorithm result fails to match the SKIM's result.

POSSIBLE CAUSES
CHECKING MULTIPLE KEY OPERATION
SKIM
INTERMITTENT WIRING HARNESS PROBLEM
REPLACE IGNITION KEY

TRANSPONDER COMMUNICATION FAILURE — Continued

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, read and record the SKIM DTCs. With the DRBIII®, erase the SKIM DTCs. **NOTE: Perform the following test several times to ensure the DTC is current.** Turn the ignition off. Wait 10 seconds. Turn the ignition on. With the DRBIII®, read the SKIM DTCs. Does the DRBIII® display the DTC that was previously erased? Yes → Go To 2 No → Go To 7	All
2	Are there multiple vehicle ignition keys available? Yes → Go To 3 No → Go To 4	All
3	**NOTE: Perform the following steps using one of the vehicle ignition keys. When finished, repeat the procedure using each of the other vehicle keys one at a time.** With the DRBIII®, erase the SKIM DTCs. Turn the ignition off. Wait 10 seconds. Turn the ignition on. With the DRBIII®, read the SKIM DTCs. Is the DTC present for all ignition keys? Yes → Replace and program the Sentry Key Immobilizer Module in accordance with the Service Information. Perform SKIS VERIFICATION. No → Replace the ignition key(s) that cause the SKIM DTC. Perform SKIS VERIFICATION.	All
4	With the DRBIII®, attempt to reprogram the ignition keys to the SKIM. With the DRBIII®, erase the SKIM DTCs. Wait 10 seconds. Turn the ignition on. With the DRBIII®, read the SKIM DTCs. Does the DTC set again? Yes → Go To 5 No → Test Complete.	All
5	Replace the ignition key with a new key. With the DRBIII®, program the new ignition key to the SKIM. With the DRBIII®, erase the SKIM DTCs. Turn the ignition off. Wait 10 seconds. Turn the ignition on. With the DRBIII®, read the SKIM DTCs. Does the DTC set again? Yes → Go To 6 No → Test Complete.	All

TRANSPONDER COMMUNICATION FAILURE — Continued

TEST	ACTION	APPLICABILITY
6	If there are no possible causes remaining, view repair. Repair Replace and program the Sentry Key Immobilizer Module in accordance with the Service Information. Perform SKIS VERIFICATION.	All
7	Turn the ignition off. **Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.** **NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.** **Note: Refer to any Technical Service Bulletins (TSB) that may apply.** Were any problems found? Yes → Repair wiring harness/connectors as necessary. Perform SKIS VERIFICATION. No → Test Complete.	All

Verification Tests

BODY VERIFICATION TEST - VER 1	APPLICABILITY
1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors. 2. If the Sentry Key Immobilizer Module (SKIM) or the Engine Control Module (ECM) was replaced, proceed to number 5. If the SKIM or ECM was not replaced, continue to the next number. 3. If the Body Control Module was replaced, turn the ignition on for 15 seconds (to learn VIN). If the vehicle is equipped with VTSS, use the DRB and enable VTSS. 4. Program tire size, country code and all RKE transmitters (if RKE Module was replaced) and other options as necessary. Proceed to number 12. 5. Obtain the Vehicle's unique PIN assigned to it's original SKIM from the vehicle's invoice. 6. NOTE: Once Secured Access Mode is active, the SKIM will remain in that mode for 60 seconds. 7. With the DRB, select THEFT ALARM, SKIM, MISCELLANEOUS and select SKIM REPLACED. Enter the 4 digit PIN to put the SKIM in Secured Access Mode. 8. The DRB will prompt for the following steps. 9. Using the DRB, program all customer keys into the SKIM memory. This requires that the SKIM be in Secured Access Mode, using the 4 digit PIN. 10. Note: If the ECM is replaced, the VIN and the unique Secret Key data must be transferred from the SKIM to the ECM. This procedure requires the SKIM to be placed in Secured Access Mode using the 4-digit PIN. 11. Note: If 3 attempts are made to enter Secured Access Mode using an incorrect PIN, Secured Access Mode will be locked out for 1 hour which causes the DRB to display "Bus +\- Signals Open". To exit this mode, turn ignition to Run for 1 hour. 12. Ensure all accessories are turned off and the battery is fully charged. 13. Turn the Ignition on and with the DRB, erase all Diagnostic Trouble Codes from ALL modules. Start the engine and allow it to run for 2 minutes and fully operate the system that was malfunctioning. 14. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the DRB, read DTCs from ALL modules. Are any DTCs present or is the original complaint still present? Yes → Repair is not complete, refer to the appropriate symptom. No → Repair is complete.	All

CHARGING VERIFICATION - VER-3	APPLICABILITY
1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary. 2. With the DRB, erase all diagnostic trouble codes (DTCs). 3. Start the engine. 4. Raise the engine speed to 2000 RPM for at least 30 seconds. 5. Allow the engine to idle. 6. Turn the ignition off for 20 seconds. 7. Turn the ignition on. 8. With the DRB, read ECM DTCs. 9. If this DTC has set again, or another DTC has set, look for any Technical Service Bulletins (TSBs) that may relate to this condition. Return to the Symptom List if necessary. 10. If the charging system is functioning correctly and there are no DTCs, the repair is now complete. Are any DTCs or symptoms remaining? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

Verification Tests — Continued

NO START VERIFICATION - VER-1	APPLICABILITY
1. NOTE: IMPORTANT! If the Engine Control Module or Sentry Key Immobilizer Module has been replaced, ensure the programming procedure for the module has been performed in accordance with the Service Information. 2. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary. 3. Inspect the engine oil for contamination. If it is contaminated, change the oil and filter. 4. With the DRB, erase all diagnostic trouble codes (DTCs). 5. Turn the ignition off for at least 10 seconds. 6. Attempt to start the engine. 7. If the engine is unable to start, look for any Technical Service Bulletins (TSBs) that may relate to this condition. Return to the Symptom List if necessary. 8. If the engine starts and continues to run, the repair is now complete. Are any DTCs or symptoms remaining? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

ROAD TEST VERIFICATION - VER-2	APPLICABILITY
1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary. 2. If this verification procedure is being performed after a non-DTC test, perform steps 3 and 4. 3. Check to see if the initial symptom still exists. If there are no trouble codes and the symptom no longer exists, the repair was successful and testing is now complete. 4. If the initial or another symptom exists, the repair is not complete. Check all pertinent Technical Service Bulletins (TSBs) and return to the Symptom List if necessary. 5. For previously read DTCs that have not been dealt with, return to the Symptom List and follow the diagnostic path for that DTC; otherwise, continue. 6. If the Engine Control Module (ECM) has not been changed, perform steps 7 and 8, otherwise, continue with step 9. 7. With the DRB, erase all diagnostic trouble codes (DTCs), then disconnect the DRB. 8. Turn the ignition off for at least 10 seconds. 9. If equipped with a Transfer Case Position Switch, perform step 10, otherwise, continue with step 11. 10. With the ignition switch on, place the Transfer Case Shift Lever in each gear position, stopping for 15 seconds in each position. 11. Ensure no DTCs remain by performing steps 12 through 15. 12. Road test the vehicle. For some of the road test, go at least 64 km/h (40 MPH). If this test is for an A/C Relay Control Circuit, drive the vehicle for at least 5 minutes with the A/C on. 13. At some point, stop the vehicle and turn the engine off for at least 10 seconds, then restart the engine and continue. 14. Upon completion of the road test, turn the engine off and check for DTCs with the DRB. 15. If the repaired DTC has set again, the repair is not complete. Check for any pertinent Technical Service Bulletins (TSBs) and return to the Symptom List. If there are no DTCs, the repair was successful and is now complete. Are any DTCs or symptoms remaining? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

Verification Tests — Continued

SKIS VERIFICATION	APPLICABILITY
1. Reconnect all previously disconnected components and connectors. 2. Obtain the vehicle's unique Personal Identification Number (PIN) assigned to it's original SKIM. **3. NOTE: When entering the PIN, care should be taken because the SKIM will only allow 3 consecutive attempts to enter the correct PIN. If 3 consecutive incorrect PINs are entered, the SKIM will Lock Out the DRB for 1 hour.** 4. To exit Lock Out mode, the ignition key must remain in the Run position continually for 1 hour. Turn off all accessories and connect a battery charger if necessary. 5. With the DRB, select Theft Alarm, SKIM and Miscellaneous. Then, select the desired procedure and follow the steps that will be displayed. 6. If the SKIM has been replaced, ensure all of the vehicle ignition keys are programmed to the new SKIM. **7. NOTE: Prior to returning vehicle to the customer, perform a module scan to be sure that all DTCs are erased. Erase any DTCs that are found.** 8. With the DRB, erase all DTCs. Perform 5 ignition key cycles leaving the key on for at least 90 seconds per cycle. 9. With the DRB, read the SKIM DTCs. Are there any SKIM DTCs? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

SPEED CONTROL VERIFICATION - VER-4	APPLICABILITY
1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary. 2. With the DRB, erase all diagnostic trouble codes (DTCs). 3. Road test the vehicle at a speed above 58 km/h (35 MPH). 4. Turn the speed control ON/OFF switch on. 5. Depress and release the SET switch. If the speed control does not engage, the repair is not complete, continue with step 12. 6. Quickly depress and release the RESUME/ACCEL switch. If the vehicle speed does not increase by 3 km/h (2 MPH), the repair is not complete, continue with step 12. 7. Using caution, depress and release the brake pedal. If the speed control does not disengage, the repair is not complete, continue with step 12. 8. With the vehicle speed at least 56 km/h (35 MPH), depress the RESUME/ACCEL switch. If the speed control does not resume at the previously set speed, the repair is not complete, continue with step 12. 9. Hold down the COAST switch. If the vehicle does not decelerate, the repair is not complete, continue with step 12. 10. While still holding down the COAST switch, ensure the vehicle speed is at least 56 km/h (35 MPH) and release the COAST switch. If the vehicle does not adjust and set a new vehicle speed, the repair is not complete, continue with step 12. 11. With the speed control engaged, depress the ON/OFF switch. If the speed control does not disengage, the repair is not complete, continue with step 12. 12. If the vehicle did not successfully perform all of the previous steps, check for Technical Service Bulletins (TSBs) that pertain to this speed control problem and then, if necessary, return to the Symptom List. 13. If the vehicle successfully performed all of the previous steps, the speed control system is now functioning as designed. The repair is now complete. Are any DTCs or symptoms remaining? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

Verification Tests — Continued

W5J400 TRANSMISSION VERIFICATION TEST - VER 1	APPLICABILITY
1. NOTE: If the TCM was replaced, use the DRBIII® to program the VIN information into the TCM 2. Reconnect any disconnected components. 3. Connect the DRBIII® to the Data Link Connector. 4. With the DRBIII®, erase ABS DTC's. 5. With the DRBIII®, erase PCM/ECM DTC's. 6. With the DRBIII®, erase Transmission DTC's. 7. With the DRBIII®, display Transmission Temperature. Start and run the engine until the Transmission Temperature is HOT, above 43° C (110° F). 8. Check the Transmission fluid and adjust if necessary. Refer to the Service Information for the proper Fluid Fill procedure. 9. Perform the ADAPTION PROCEDURE whenever the TCM and/or the Transmission has been replaced or major Transmission repairs have been performed. If none of these apply, proceed to ROAD TEST PROCEDURE. 10. ADAPTION PROCEDURE 11. With the DRBIII®, reset the Transmission adaptives. Resetting the adaptives will set the adaptives to factory settings. 12. Drive the Vehicle until the Transmission Temperature is in the specified range. **13. NOTE: Perform the Coast Down Adaptations first. The Transmission Temperature must be greater than 60° C (140° F) and less than 70° C (158° F). Failure to stay within these temperature ranges will void the procedure.** 14. Perform 4 to 5 Coast Downs from 5th to 4th gear and then 4th to 3rd gear. **15. NOTE: For Upshift adaption, the Transmission temperature must be greater than 60° C (140° F) and less than 100° C (212° F). Failure to stay within these temperature ranges will void this procedure.** 16. From a stop, moderately accelerate the vehicle and obtain all forward gear ranges while keeping the Engine RPM below 1800 RPM. Repeat this procedure 4 to 5 times. 17. Obtaining 5th gear may be difficult at 1800 RPM. Allow the transmission to shift into 5th gear at a higher RPM then lower the RPM to 1800 and perform manual shifts between 4th and 5th gears using the shift lever. 18. The TCM will store the adaptives every 10 minutes. After completion of the Adaption Procedure make sure the vehicle stays running for at least 10 minutes. To manually store the adaptives under 10 minutes, use the DRBIII® Store Adaptives procedure. 19. If the Shift Quality is not acceptable after performing the Adaption Procedure, repeat the Adaption Procedure. **20. NOTE: If internal repairs were performed and the shift quality is still poor after repeating the Adaption Procedure, it may be necessary to check the internal repair. Also check for any TSBs and/or Controller Flash updates that may apply.** 21. ROAD TEST PROCEDURE 22. Road test the vehicle. Make fifteen to twenty 1-2, 2-3, 3-4 and 4-5 upshifts. 23. Perform these shifts from a standing start to 72 Km/h or 45 MPH with a constant throttle opening of 20 to 25 degrees. 24. With speeds below 40 Km/h or 25 MPH, make five to eight wide open throttle kickdowns to 1st gear. Allow at least 5 seconds each in 2nd and 3rd gear between each kickdown. 25. With the DRBIII®, perform the Transmission Solenoid Test. 26. With the DRBIII®, read Transmission DTCs. Were there any Diagnostic Trouble Codes set? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

NOTES

1.0 INTRODUCTION

The procedures contained in this manual include all the specifications, instructions and graphics needed to diagnose 2002 body system problems. The diagnostics in this manual are based on the failure condition or symptom being present at the time of diagnosis.

Please follow the recommendations below when choosing your diagnostic path.

1. First make sure the DRBIII® is communicating with the appropriate modules; i.e., if the DRBIII® displays a "No Response" or a "Bus ± Signals Open" condition, you must diagnose that first.
2. Read DTC's (diagnostic trouble codes) with the DRBIII®.
3. If no DTC's are present, identify the customer complaint.
4. Once the DTC or customer complaint is identified, locate the matching test in the Table of Contents and begin to diagnose the symptom.

All component location views are in Section 8.0. All connector pinouts are in Section 9.0. All schematics are in Section 10.0.

An * placed before the symptom description indicates a customer complaint.

When repairs are required, refer to the appropriate service information for the proper removal and repair procedure.

Diagnostic procedures change every year. New diagnostic systems may be added: carryover systems may be enhanced. READ THIS MANUAL BEFORE TRYING TO DIAGNOSE A VEHICLE DIAGNOSTIC TROUBLE CODE. It is recommended that you review the entire manual to become familiar with all the new and changed diagnostic procedures.

This book reflects many suggested changes from readers of past issues. After using this book, if you have any comments or suggestions, please fill out the sheet in the back of this book and mail it back to us.

1.1 SYSTEM COVERAGE

This diagnostic procedures manual covers all 2002 JEEP GRAND CHEROKEE "body" related faults. This diagnostic procedures manual also covers both left hand drive (LHD) and right hand drive (RHD) vehicles. There may be some slight differences in the location views of components. If the location views shown are on a LHD vehicle, a RHD vehicle will be symmetrically opposite.

1.2 SIX-STEP TROUBLESHOOTING PROCEDURE

Diagnosis of the body system is done in six basic steps:

- verification of complaint
- verification of any related symptoms
- symptom analysis
- problem isolation
- repair of isolated problem
- verification of proper operation

2.0 IDENTIFICATION OF SYSTEM

The vehicle systems that are part of the "body" system are:

- Airbag
- Audio
- Chime
- Communication
- Electrically heated system
- Exterior lighting
- Heating and A/C
- Instrument Cluster
- Interior Lighting
- Memory Seat
- Overhead Console
- Power Door Lock/RKE
- Power mirrors
- Power sunroof
- Power windows
- Tire Pressure Monitoring (TPM)
- Vehicle theft security system (VTSS)
- Windshield Wiper and Washer

3.0 SYSTEM DESCRIPTION AND FUNCTIONAL OPERATION

The body system on the 2002 WJ/WG consists of a combination of modules that communicate over the PCI bus (Programmable Communication Interface multiplex system). Through the PCI bus, information about the operation of vehicle components and circuits is relayed quickly to the appropriate module(s). All modules receive all the information transmitted on the bus even though a module may not require all information to perform it's function. It will only respond to messages "addressed" to it through a binary coding process. This method of data transmission significantly reduces the complexity of the wiring in the vehicle and the size of wiring harnesses. All of the information about the functioning of all the systems is organized, controlled, and communicated by the PCI bus, which is described in the Communication Section of this general information.

3.1 AIRBAG SYSTEM/OCCUPANT RESTRAINT CONTROLLER SYSTEM

The 2002 WJ/WG Airbag System contain the following components: Occupant Restraint Controller (ORC), Airbag Warning Indicator, Clockspring, Driver and Passenger Airbags, Driver and Passenger Hall-effect Seat Belt buckle Switches (SBS), Driver and Passenger Front and Side Impact Sensors, curtain Airbags, and front impact sensors.

The Occupant Restraint Controller (ORC) is a new type of Airbag Control Module (ACM). The new ACM supports staged airbag deployment and remote impact sensing. Staged deployment is the ability to trigger airbag system squib inflators individually as needed to provide the appropriate restraint for the severity of the impact. The ACM has four major functions: PCI Bus communications, onboard diagnostics, impact sensing, and component deployment. The ACM also contains an energy-storage capacitor. This capacitor stores enough electrical energy to deploy the front airbag components for two seconds following a battery disconnect or failure during an impact. The ACM is secured to the floor panel transmission tunnel under the console. The ACM cannot be repaired or adjusted.

The ACM sends and/or receives PCI Bus messages with the Instrument Cluster (MIC), Body Control Module (BCM), and Impact Sensors Diagnostic trouble codes will be set if the communication with these modules is lost or contains invalid information.

The microprocessor in the ACM monitors the impact sensors signals and the airbag system electrical circuits to determine the system readiness. If the ACM detects a monitored system fault it sends a message to the instrument cluster via PCI bus to turn on the airbag warning indicator. The ACM can set both active and stored diagnostic trouble codes to aid in the diagnosing system problems. See DIAGNOSTIC TROUBLE CODES in this section.

The ACM uses two front impact sensors and ACM Accelerometer to sense the rate of vehicle deceleration, provide verification of the direction and severity of an impact. A pre-programmed decision algorithm in the ACM microprocessor determines when the deceleration rate is severe enough to require airbag system protection. The ACM also uses the driver and front passenger seat belt switch status (buckled or unbuckled) and crash severity to determine the level of driver and front passenger airbag deployment, low medium or high. When the programmed conditions are met, the ACM sends an electrical signal to deploy the appropriate airbag system components.

WARNING: THE AIRBAG SYSTEM IS A SENSITIVE, COMPLEX ELECTRO-MECHANICAL UNIT. BEFORE ATTEMPTING TO DIAGNOSE OR SERVICE ANY AIRBAG SYSTEM OR RELATED STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENTS YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE. WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO DO THIS COULD RESULT IS ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY. NEVER STRIKE OR KICK THE AIRBAG CONTROL MODULE, AS IT CAN DAMAGE THE IMPACT SENSOR OR AFFECT ITS CALIBRATION. IF AN AIRBAG CONTROL MODULE IS ACCIDENTALLY DROPPED DURING SERVICE, THE MODULE MUST BE SCRAPPED AND REPLACED WITH A NEW UNIT.

The airbag warning indicator is the only point at which the customer can observe symptoms of a system malfunction. Whenever the ignition key is turned to the run or start position, the ACM performs a lamp check by turning the airbag warning indicator on for 6-8 seconds. After the lamp check, if the indicator turns off, it means that the ACM has checked the system and found it to be free of discernible malfunctions. If the lamp remains on, there could be an active fault in the system or the MIC lamp circuit may be internally shorted. If the lamp comes on and stays on for a period longer than 6-8 seconds then goes off, there is usually an intermittent problem in the system.

3.1.1 DRIVER AIRBAG

The airbag protective trim cover is the most visible part of the driver side airbag system. The protective trim cover is fitted to the front of the airbag module and forms a decorative cover in the center of the steering wheel. The module is mounted directly to the steering wheel. Located under the trim cover are the horn switch, the airbag cushion, and the airbag cushion supporting components. The airbag module includes a housing to which the cushion and hybrid inflator are attached and sealed. The 2002 WJ/WG is equipped with driver airbag with dual stage inflators. When supplied with the proper electrical signal, the inflator or inflators discharge the gas directly into the cushion. The airbag module cannot be repaired, and must be replaced if deployed or in any way damaged.

WARNING: THE DRIVER AIRBAG MODULE CONTAINS ARGON GAS PRESSURIZED TO OVER 17236.89 Kpa (2500 PSI). DO NOT ATTEMPT TO DISMANTLE AN AIRBAG MODULE OR TAMPER WITH ITS INFLATOR. DO NOT PUNCTURE, INCINERATE, OR BRING INTO CONTACT WITH ELECTRICITY. DO NOT STORE AT TEMPERATURE EXCEEDING 93°C (200°F). REPLACE AIRBAG SYSTEM COMPONENTS ONLY BUT INTERNAL DIFFERENCES MAY RESULT IN INFERIOR OCCUPANT PROTECTION. THE FASTENERS, SCREWS, AND BOLTS ORIGINALLY USED FOR THE AIRBAG SYSTEM COMPONENTS HAVE SPECIAL COATINGS AND ARE SPECIFICALLY DESIGNED FOR THE AIRBAG SYSTEM. THEY MUST NEVER BE REPLACED WITH ANY SUBSTITUTES. ANY TIME A NEW FASTENER IS NEEDED, REPLACE IT WITH THE CORRECT FASTENERS PROVIDED IN THE SERVICE PACKAGE OR SPECIFIED IN THE MOPAR PARTS CATALOG.

CAUTION: Deployed Front Air Bags may or may not have live pyrotechnic material within the air bag inflator. Do not dispose of 2002 Model Year Driver and Passenger Airbags unless you are sure of complete deployment. Please refer to the Hazardous Substance Control System for Proper Disposal. Dispose of deployed air bags in a manner consistent with state, provincial, local, and federal regulations. Use the following table to identify the status of the Airbag Squib.

AIRBAG SQUIB STATUS

(1) Using a DRBIII® read Airbag DTC's **If** the following active codes are present:

ACTIVE DTC	CONDITIONS	SQUIB STATUS
Driver Squib 1 open Driver Squib 2 open	Check the stored DTC's **AND IF** the stored minutes for both are within 15 minutes of each other.	Both Driver Squib 1 and 2 were used.
Driver Squib 1 open Driver Squib 2 open	Check the stored DTC's **AND IF** the stored minutes for Driver Squib 2 open is GREATER than the stored minutes for Driver Squib 1 by 15 minutes or more.	Driver Squib 1 was used; Driver Squib 2 is live.
Driver Squib 1 open Driver Squib 2 open	Check the stored DTC's **AND IF** the stored minutes for Driver Squib 1 open is GREATER than the stored minutes for Driver Squib 2 by 15 minutes or more.	Driver Squib 1 is live; Driver Squib 2 was used.
If Driver Squib 1 open	**AND IF** Driver Squib 2 opens is NOT an active code.	Driver Squib 1 was used; Driver Squib 2 is live.

ACTIVE DTC	CONDITIONS	SQUIB STATUS
If Driver Squib 2 open	**AND IF** Driver Squib 1 open is NOT an active code.	Driver Squib 1 is live; Driver Squib 2 was used.

If neither of the following codes is an active code:

ACTIVE DTC	SQUIB STATUS
Driver squib 1 open	Status of Airbag is Unknown.
Driver Squib 2 open	

3.1.2 CLOCKSPRING

The clockspring is mounted on the steering column behind the steering wheel. This assembly consist of a plastic housing which contains a flat, ribbon-like, electrically conductive tape that winds and unwinds with the steering wheel rotation. The clockspring is used to maintain a continuous electrical circuit between the instrument panel wiring and the driver airbag, the horn, and the vehicle speed control switches if equipped. The clockspring must be properly centered when it is reinstalled on the steering column following any service procedure, or it could be damaged. The clockspring cannot be repaired and it must be replaced.

3.1.3 PASSENGER AIRBAGS

The 2002 WJ/WG is equipped with front passenger airbag with dual stage squib inflators. When supplied with the proper electrical signal the passenger airbag inflator or inflators discharge the gas directly into the cushion. The airbag module cannot be repaired, and must be replaced if deployed or in any way damaged.

WARNING: THE PASSENGER AIRBAG MODULE CONTAINS INERT GAS PRESSURIZED TO 17236.89 Kpa (2500 PSI). DO NOT ATTEMPT TO DISMANTLE AN AIRBAG MODULE OR TAMPER WITH ITS INFLATOR. DO NOT PUNCTURE, INCINERATE, OR BRING INTO CONTACT WITH ELECTRICITY. DO NOT STORE AT TEMPERATURE EXCEEDING 93°C (200°F). REPLACE AIRBAG SYSTEM COMPONENTS ONLY WITH PARTS SPECIFIED IN THE MOPAR PARTS CATALOG. SUBSTITUTE PARTS MAY APPEAR INTERCHANGEABLE, BUT INTERNAL DIFFERENCES MAY RESULT IN INFERIOR OCCUPANT PROTECTION. THE FASTENERS, SCREWS, AND BOLTS ORIGINALLY USED FOR THE AIRBAG SYSTEM COMPONENTS HAVE SPECIAL COATINGS AND ARE SPECIFICALLY DESIGNED FOR THE AIRBAG SYSTEM. THEY MUST NEVER BE REPLACED WITH ANY SUBSTITUTES. ANY TIME A NEW FASTENER IS NEEDED, REPLACE IT WITH THE CORRECT FASTENERS PROVIDED IN THE SERVICE PACKAGE OR SPECIFIED IN THE MOPAR PARTS CATALOG.

CAUTION: Deployed Front Air Bags may or may not have live pyrotechnic material within the air bag inflator. Do not dispose of 2002 Model Year Driver and Passenger Airbags unless you are sure of complete deployment. Please refer to the Hazardous Substance Control System for Proper Disposal. Dispose of deployed air bags in a manner consistent with state, provincial, local, and federal regulations. Use the following table to identify the status of the Airbag Squib.

AIRBAG SQUIB STATUS

(1) Using a DRBIII® read Airbag DTC's **If** the following active codes are present:

ACTIVE DTC	CONDITIONS	SQUIB STATUS
Passenger Squib 1 open Passenger Squib 2 open	Check the stored DTC's **AND IF** the stored minutes for both are within 15 minutes of each other.	Both Passenger Squib 1 and 2 were used.
Passenger Squib 1 open Passenger Squib 2 open	Check the stored DTC's **AND IF** the stored minutes for Passenger Squib 2 open is GREATER than the stored minutes for Passenger Squib 1 by 15 minutes or more.	Passenger Squib 1 was used; Passenger Squib 2 is live.

ACTIVE DTC	CONDITIONS	SQUIB STATUS
Passenger Squib 1 open Passenger Squib 2 open	Check the stored DTC's **AND IF** the stored minutes for Passenger Squib 1 open is GREATER than the stored minutes for Driver Squib 2 by 15 minutes or more.	Passenger Squib 1 is live; Driver Squib 2 was used.
If Passenger Squib 1 open	**AND IF** Passenger Squib 2 open is NOT an active code.	Passenger Squib 1 was used; Passenger Squib 2 is live.
If Passenger Squib 2 open	**AND IF** Passenger Squib 1 open is NOT an active code.	Passenger Squib 1 is live; Passenger Squib 2 was used.

If neither of the following codes is an active code:

ACTIVE DTC	SQUIB STATUS
Passenger squib 1 open	Status of Airbag is Unknown.
Passenger squib 2 open	

3.1.4 SEAT BELT SWITCHES (SBS)

The hall-effect driver and front passenger seat belt switches provide the seat belt status, buckled or unbuckled, via hardwired inputs to the ACM. The ACM uses seat belt switch inputs to determine the appropriate level of airbag deployment. The ACM also controls the seat belt warning indicator via a PCI Bus message to the instrument cluster. The indicator will be turned on if the driver seat belt status is unbuckled. If the seat belt switches are damaged or defective the seat belt buckle assembly must be replaced. The ACM continuously monitors the seat belt switch circuits for an open or shorted conditions.

3.1.5 CURTAIN AIRBAGS

The Left and Right curtain airbags are located in the outboard edge of the roof under the headliner, just above the door openings. When supplied with the proper electrical signal the inflator can discharge the compress gas directly into the curtain airbag. Upon deployment, the curtain will tear open the headliner allowing the curtain airbag to fully deploy between the headliner and seat. The curtain airbag cannot re repaired and must be replaced if deployed or in any way damaged.

WARNING: THE CURTAIN AIRBAG CONTAINS AN INERT GAS PRESSURIZED TO 17236.89 Kpa (2500 PSI). DO NOT ATTEMPT TO DISMANTLE AN AIRBAG MODULE OR TAMPER WITH ITS INFLATOR. DO NOT PUNCTURE, INCINERATE, OR BRING INTO CONTACT WITH ELECTRICITY. DO NOT STORE AT TEMPERATURE EXCEEDING 93°C (200°F). REPLACE AIRBAG SYSTEM COMPONENTS ONLY WITH PARTS SPECIFIED IN THE CHRYSLER MOPAR PARTS CATALOG. SUBSTITUTE PARTS MAY APPEAR INTERCHANGEABLE, BUT INTERNAL DIFFERENCES MAY RESULT IN INFERIOR OCCUPANT PROTECTION. THE FASTENERS, SCREWS, AND BOLTS ORIGINALLY USED FOR THE AIRBAG SYSTEM COMPONENTS HAVE SPECIAL COATINGS AND ARE SPECIFICALLY DESIGNED FOR THE AIRBAG SYSTEM. THEY MUST NEVER BE REPLACED WITH ANY SUBSTITUTES. ANY TIME A NEW FASTENER IS NEEDED, REPLACE IT WITH THE CORRECT FASTENERS PROVIDED IN THE SERVICE PACKAGE OR SPECIFIED IN THE MOPAR PARTS CATALOG.

3.1.6 FRONT IMPACT SENSOR

The front impact sensors are electronic accelerometers that sense the rate of vehicle deceleration, and then combined with the ACM Accelerometer provides verification of the direction and severity of an impact. Each sensor also contains an electronic communication chip that allows the unit to communicate the sensor status as well as sensor fault information to the microprocessor in the Airbag Control Module. The ACM microprocessor continuously monitors all of the front passive restraint system electrical circuits to determine the system readiness. If the ACM detects a system fault, it sets a Diagnostic Trouble Code and controls the airbag indicator operation accordingly. The impact sensors each receive battery current and ground through dedicated left and right sensor signal and ground circuits from the ACM. The impact sensors and the ACM communicate by modulating the voltage in the sensor signal circuit. If the sensor is dropped it must be replaced. Disconnect the battery or remove both airbag fuses before servicing impact sensors.

CAUTION: Do not remove or install impact sensors while the sensor is connected to the vehicle wiring.

3.1.7 SIDE IMPACT SENSOR

The side impact sensors are electronic accelerometers that sense the rate of vehicle deceleration and when combined with the ACM Accelerometer provides verification of the direction and severity of a side impact. Each sensor also contains an electronic communication chip that allows the unit to communicate the sensor status as well as sensor fault information to the microprocessor in the Airbag Control Module. The ACM microprocessor continuously monitors all of the passive restraint system electrical circuits to determine the system readiness. If the ACM detects a system fault, it sets a Diagnostic Trouble Code and controls the airbag warning indicator operation accordingly. The side impact sensors receive battery current and ground through dedicated driver and passenger sensor signal and ground circuits from the ACM. The impact sensors and the ACM communicate by modulating the voltage in the sensor signal circuit. If the sensor is dropped it must be replaced. Disconnect the battery or remove both airbag fuses before servicing impact sensors.

CAUTION: Do not remove or install the impact sensors while the sensor is connected to the vehicle wiring.

3.1.8 SPECIAL TOOLS

Some airbag diagnostic test use special tools, airbag load tools, 8310 and 8443 for testing squib circuits. The load tools contain fixed resistive loads, jumpers and adapters. The fixed loads are connected to cables and mounted in a storage case. The cables can be directly connected to some airbag system connectors. Jumpers are used to convert the load tool cable connectors to the other airbag system connectors. The adapters are connected to the module harness connector to open shorting clips and protect the connector terminal during testing. When using the load tool follow all of the safety procedures in the service information for disconnecting airbag system components. Inspect the wiring, connector and terminals for damage or misalignment. Substitute the airbag load tool in place of a Driver or Passenger Airbag, curtain airbag, clockspring (use a jumper if needed). Then follow all of the safety procedures in the service information for connecting airbag system components. Read the module active DTC's. If the module reports NO ACTIVE DTC's the defective components has been removed from the system and should be replaced. If the DTC is still active, continue this process until all component in the circuit have been tested. Then disconnect the module connector and connect the matching adapter to the module connector. With all airbags disconnected and the adapter installed the squib wiring can be tested for open and shorted conditions.

3.1.9 DIAGNOSTIC TROUBLE CODES

Airbag diagnostic trouble codes consist of active and stored codes. If more than one code exists, diagnostic priority should be given to the active codes. Each diagnostic trouble code is diagnosed by following a specific testing procedure. The diagnostic test procedures contain step-by-step instructions for determining the cause of the trouble codes. It is not necessary to perform all of the tests in this book to diagnose an individual code. Always begin by reading the diagnostic trouble codes with the DRBIII®. This will direct you to the specific test(s) that must be performed. In certain test procedures within this manual, diagnostic trouble codes are used as a diagnostic tool.

3.1.9.1 ACTIVE CODES

The code becomes active as soon as the malfunction is detected or key-on, whichever occurs first. An active trouble code indicates an on-going malfunction. This means that the defect is currently there every time the airbag control module checks that circuit or component. It is impossible to erase an active code. Active diagnostic trouble codes for the airbag system are not permanent and will change within 12 seconds the reason for the code is corrected. With the exception of the warning lamp trouble codes or malfunctions, when a malfunction is detected, the airbag lamp remains lit for a minimum of 12 seconds or as long as the malfunction is present.

3.1.9.2 STORED CODES

Airbag codes are automatically stored in the ACM's memory as soon as the malfunction is detected. A stored code indicates there was an active code present at some time. When a trouble code occurs, the airbag warning indicator illuminates for 12 seconds minimum (even if the problem existed for less than 12 seconds). The code is stored, along with the time in minutes it was active, and the number of times the ignition has been cycled since the problem was last detected.

The minimum time shown for any code will be one minute, even if the code was actually present for less than one minute. Thus, the time shown for a code that was present for two minutes 13 seconds, for example, would be three minutes. If a malfunction is detected a diagnostic trouble code is stored and will remain stored. When and if the malfunction ceases to exist, an ignition cycle count will be initiated for that code. If the ignition cycle count reaches 254 without a reoccurrence of the same malfunction, the diagnostic trouble code is erased and that ignition cycle counter is reset to zero. If the malfunction reoccurs before the count reaches 254, then the ignition cycle counter will be reset and diagnostic trouble code will continue to be a stored code. If a malfunction is not active while performing a diagnostic test procedure, the active code diagnostic test will not locate the source of the problem. In this case, the stored code can indicate an area to inspect. Maintain a safe distance from all airbags while performing the following inspection. If no obvious problems are found, erase stored codes, and with the ignition on wiggle the wire harness and connectors, rotate the steering wheel from stop to stop. Recheck for codes periodically as you work through the system. This procedure may uncover a malfunction that is difficult to locate.

3.2 AUDIO SYSTEM

The PCI Bus inputs into the radio are used for VF dimming and remote steering wheel controls. All the radios are capable of displaying faults and allowing certain actuation tests through the use of the DRBIII®. When attempting to perform PCI Bus diagnostics, the first step is to identify the radio in use in the vehicle.

When trouble shooting output shorts or “output” error messages, the following applies:

On radios without an external amplifier, the term output refers to the path between the radio and the speaker. This type of circuit can be monitored all the way through the speaker connections by the radio assembly. When the radio displays a shorted output DTC with this type of system, the speaker, radio, or wiring could be at fault.

On radios with an external amplifier, the term “output” refers to the circuit between the radio connector and the amplifier. The radio is capable of monitoring only this portion and can tell nothing about the circuit between the amplifier and the speakers. Consequently, a shorted output DTC on this type of system would only refer to this circuit. A faulty speaker could not cause this DTC.

3.2.1 REMOTE RADIO CONTROLS

These radios can be controlled via remote radio switches (optional). These switches are located on the back side of the steering wheel. They control mode, preset, seek up, seek down, volume up and volume down functions.

These functions are inputs to the Body Control Module and can be read with the DRBIII®. The switches are a multiplexed signal to the BCM. The radio control MUX circuit is a 5 volt line that is pulled to ground through different value resistors built into the switches. This causes a voltage drop to be seen by the BCM and it sends a specific message to the radio on the PCI Bus circuit. The radio then responses to the message.

This circuit is fairly simple to troubleshoot. The circuit must be complete from the switches in the steering wheel to the BCM. The ground must be complete so that the switches can cause the voltage drop for the BCM to see. The circuit passes through the clockspring so continuity through this devise must be verified.

3.2.2 CD CHANGER

The CD Changer is mounted in the cargo area of the passenger compartment on the right rear quarter panel. The CD Changer features a removable 10-CD magazine. The CD Changer receives both ground and radio switch power through the radio. The controls on the radio operate the CD Changer through messages sent over the PCI Bus. The two-channel audio outputs of the CD Changer are hard-wired back to the radio, which then outputs the signal through the channels to the speakers or amplifiers.

3.3 HEATING & A/C SYSTEM

3.3.1 SYSTEM AVAILABILITY

- Depending on the model, either a Manual Temperature Control (MTC) or Automatic Zone Control (AZC) HVAC system is available in these vehicles.

3.3.2 SYSTEM CONTROLS

Manual Temperature Control (MTC)

- Refer to the Service Manual for MTC system description and operation information.

The Automatic Zone Control (AZC) Module:

- is fully addressable with the DRBIII®.
- communicates over the Programmable Communication Interface Multiplex System (PCI) Bus.
- has dual infrared sensors, mounted in the AZC module face, which independently measure surface temperature to maintain occupant comfort levels.

- has dual-zone temperature-controls to provide a wide side-to-side variation in temperature to meet the needs of either front seat occupant.
- can be operated in a manual mode.
- uses engine temperature data, received over the PCI Bus, for cold engine blower lock-out.
- uses engine RPM data, received over the PCI Bus, for wide-open throttle A/C cut-out.
- uses vehicle speed data, received over the PCI Bus, to determine air-flow over the condenser for optimum cooling performance.
- uses Evaporator Temperature Sensor data, received over the PCI Bus, to prevent evaporator freeze up while maintaining optimum cooling performance.
- uses Ambient Temperature Sensor data, received over the PCI Bus, to optimize comfort control.
- provides an A/C request to the BCM when compressor operation is desired.
- controls rear defogger operation.
- controls fan speed, providing 10 blower speeds in manual mode and infinite speeds in automatic mode.
  - The Blower Motor Controller provides a 5.0 volt signal to the AZC Module over the Blower Motor Control circuit. The AZC Module provides a variable duty cycle ground to the 5.0 volt signal based on input from the blower switch. When the blower switch is set to LO speed, the AZC Module provides a short duty cycle (less time grounding the signal voltage). As higher blower speeds are requested, the AZC Module increases the duty cycle (more time grounding the signal voltage). When the blower switch reaches HI speed, the duty cycle increases to where the signal pattern is almost a flat line (with brief voltage spikes).
- controls electronic door actuator operation.
  - A simplified control system for operation of the mode, recirculation, and temperature control actuators provides positive positioning without the complexity of feedback from position sensors. The AZC Module knows the number of operating actuator revolutions required for full door travel as well as the number of actuator commutator pulses per revolution. Using these parameters, the AZC Module runs the actuator for the number of commutator pulses that correspond to the desired door position. To maintain accuracy, the system recalibrates itself periodically at known zero and full travel conditions.
- Refer to the Service Manual for additional AZC system description and operation information.

The Dual-Zone AZC HVAC system uses:

- two, two-wire electronic blend door actuators.
- one, two-wire electronic mode door actuator.
- one, two-wire electronic recirculation door actuator.

3.3.3 SYSTEM REVISIONS

The 2002 WJ/WG HVAC systems remain mostly carryover from 2001. Revisions to the 2002 MTC and AZC HVAC systems include:

- the addition of an Evaporator Temperature Sensor which is hard wired to the BCM. Data from the sensor is used to prevent evaporator freeze up while maintaining optimum cooling performance.
- new Diagnostic Trouble Codes (DTCs) for a short low and for an open on the Evaporator Temperature Sensor circuit.

3.3.4 SYSTEM DIAGNOSTICS (MTC)

Fault detection is through Diagnostic Trouble Codes (DTCs)

- DTCs are displayed by the DRBIII®.
- DTCs pertaining to the Evaporator Temperature Sensor are stored in the BCM. Diagnostics for these DTCs can be found in the Heating & A/C category of this manual.
- Diagnostics for symptoms pertaining to A/C compressor operation can be found in the Heating & A/C category of this manual and in the Powertrain Diagnostic Procedures manual.
- DTCs pertaining to A/C compressor control circuits are stored in the PCM/ECM. Diagnostics for these DTCs can be found in the Powertrain Diagnostic Procedures manual
- Refer to the Service Manual for additional MTC system diagnosis and testing information.

3.3.5 SYSTEM DIAGNOSTICS (AZC)

Fault detection is through active and stored Diagnostic Trouble Codes (DTCs)

- DTCs are displayed by the DRBIII®.

  AZC Module DTCs

- Active DTCs are those which currently exist in the system. The condition causing the fault must be repaired in order to clear this type of DTC.
- Active DTCs become stored DTCs when the condition that caused the active DTC no longer exists.
- Stored DTCs will be erased after 72 key cycles or by clearing them with the DRBIII®.
- Diagnostics for symptoms pertaining to A/C compressor operation can be found in the Heating &

A/C category of this manual and in the Powertrain Diagnostic Procedures manual.

- Refer to the Service Manual for additional AZC system diagnosis and testing information.

BCM DTCs

- DTCs pertaining to the Evaporator Temperature Sensor are stored in the BCM. Diagnostics for these DTCs can be found in the Heating & A/C category of this manual.

PCM/ECM DTCs

- DTCs pertaining to A/C compressor control circuits are stored in the PCM/ECM. Diagnostics for these DTCs can be found in the Powertrain Diagnostic Procedures manual.

3.3.6 FOLLOWING A REPAIR (AZC)

The AZC Reset Module function:

- is actuated with the DRBIII®.
- must be actuated if the AZC Module or any door actuator is replaced.
- homes and repositions door actuators.

3.4 BODY CONTROL MODULE

The body control module (BCM) supplies vehicle occupants with visual and audible information and controls various vehicle functions. To provide and receive information, the module is interfaced to the vehicle's serial bus communication network (Programmable Communication Interface or PCI bus). This network consists of the powertrain control module (PCM) or engine control module (ECM) (diesel), the memory/heated seat module (MHSM, MSM or HSM), the sentry key immobilizer module (SKIM), the transmission control module (TCM), the electro/mechanical instrument cluster (MIC), the driver door module (DDM), the passenger door module (PDM), the airbag control module (ACM), the controller antilock brake (CAB), the optional electronic vehicle information center (EVIC), the optional PCI radio, the optional CD changer, the optional automatic zone control module (AZC), the shifter assembly (diesel), the optional power amplifier, the optional adjustable pedal module, the optional rain sensor, and the optional intrusion transceiver module (export). The BCM is operational when battery power is supplied to the module and in addition, ignition switch power is needed for ignition switched functions.

The BCM provides the following new features:

- Full control of all exterior and interior lamps, including these features:
  - > A Battery Saver automatically turns off all exterior and interior lamps within 8 minutes after the ignition is turned off, if they are not turned off by the driver. This includes the front and rear reading/courtesy lamps and the cargo area dome lamp, even if they are turned on manually.
  - > Theater-style interior lighting dims gradually when the doors are closed.
  - > Interior courtesy lamp operation may be "defeated" using the dimmer control ring on the left multifunction switch.
  - > Instrument panel light intensity may be maximized for daytime visibility with the head lamps or parking lights by using the dimmer control ring on the left multifunction switch.
- An Accessory/Sunroof Delay allows continued operation of the sunroof and the power windows after ignition-OFF. These accessories can be operated up to 45 seconds after ignition-OFF or until door is opened.
- Beep tones for warnings and programming actions associated with the Sentry Key Immobilizer system and the EVIC.

The BCM also provides the following features:

- Intermittent wipe and low speed wiper control
- Wiper system status
- Ignition on/off timer
- VF displays synchronization
- Rear door and liftgate ajar status
- Acquisition & transmission of external temperature
- A/C select switch status
- Chime
- Courtesy lamps with fade to off feature
- Reading lights/glove box lamp load shedding control
- Exterior lighting control including automatic headlamps, fog lamp control, rear fog lamp control and parking lamps
- Exterior lamp status
- Headlamp time delay upon ignition off and headlamps switch off
- Parade mode
- Illuminated entry
- Instrument panel dimming
- Vehicle theft security system with panic & horn and hazard lamp activation
- Key-in ignition switch interface
- Brake fluid level switch/park brake switch interface
- Seatbelt reminder
- Speed sensitive intermittent wipe control
- Remote radio switch interface to radio

- Vehicle ignition status
- BCM self diagnostics
- Liftgate courtesy lamp disable
- Rear window defogger control
- Accessory delay control (windows and sunroof)
- Fuel economy and distance to empty (DTE) calculations
- Heated seat switch status
- Exterior lamp load shed
- Support of EVIC programmable features

The BCM receives information over the PCI bus from the PCM in order to support certain features. The required information is as follows:

- Engine RPM
- Engine and battery temperature
- Injector on time and distance pulses
- Vehicle speed
- Engine model
- Fuel tank level
- Vehicle identification number

The BCM provides the PCM with information on the A/C switch status.

The 2002 WJ/WG has several programmable features which can be enabled/disabled by using the EVIC or the DRBIII®.

3.5 CHIME SYSTEM

The chime system responds to requests from five modules: the Body Control Module (BCM), Electronic Vehicle Information Center (EVIC), Mechanical Instrument Cluster (MIC), Sentry Key Immobilizer Module (SKIM) and the Powertrain Control Module (PCM). Each module monitors its related systems and, via the PCI bus, requests the BCM to sound its internal chime as needed.

The chime will sound for the following conditions:

3.5.1 MIC REQUESTED CHIME MESSAGES

- Airbag
- Check Gauges: Charging Voltage Low
Coolant Temp High
Low Oil Pressure
Charging Voltage High
- Low Fuel
- ABS
- Low Battery Voltage
- Water in Fuel (Diesel)
- Low Coolant level (Diesel)

3.5.2 BCM INITIATED CHIME MESSAGES

- Headlamp ON with ignition OFF and driver door open
- Key in ignition with ignition OFF and driver door open
- Seat Belt Warning
- Overspeed Warning (Gulf Coast Countries Only)

3.5.3 EVIC CHIME REQUESTED MESSAGES

When the following messages are displayed the EVIC will send a chime request to the BCM. The BCM will respond with a series of chimes.

- Turn signal on for more than 1.0 mile
- Service reminder
- Coolant level low
- Washer fluid low
- Tire Pressure Monitoring System alert messages (if equipped)
- Door or liftgate ajar (when critical speed is reached)**

**CRITICAL SPEED CHART

DOOR AJAR	TURN CHIME ON	TURN CHIME OFF
LEFT REAR	3.0 MPH (5 kmh)	1.0 MPH (2 kmh)
RIGHT REAR	3.0 MPH (5 kmh)	1.0 MPH (2 kmh)
LIFTGATE	3.0 MPH (5 kmh)	1.0 MPH (2 kmh)
PASSENGER	3.0 MPH (5 kmh)	1.0 MPH (2 kmh)
DRIVER	10.0 MPH (16 kmh)	7.0 MPH (11 kmh)

3.5.4 SENTRY KEY IMMOBILIZER SYSTEM

The Sentry Key Immobilizer System (SKIS) also uses tactile beep support from the chime warning system. The Sentry Key Immobilizer Module (SKIM) is programmed to send chime request messages over the Programmable Communications Interface (PCI) data bus to the Body Control Module (BCM) to provide audible confirmation that:

- the SKIM has been successfully placed in the Customer Learn mode.
- A new Sentry key transponder has been successfully programmed by the SKIM.

See the owner's manual in the vehicle glove box for more information on the features, use and operation of the SKIS. Refer to **Sentry Key Immobilizer System** in the Description and Operation section of the service information - Vehicle Theft/

Alarm systems for more information on the SKIS. For diagnostic information, refer to the Powertrain Diagnostic Information.

3.6 DOOR AJAR SYSTEM

The door ajar, liftgate ajar, and the liftgate flip-up ajar states are used as inputs for various control modules on the vehicle. The DRBIII® will display the state of the door ajar, liftgate ajar, and liftgate flip-up ajar switches in Inputs/Outputs. It's important to note, that when a door, liftgate, or liftgate flip-up is closed, the switch state on the DRBIII® will show OPEN, and when the door, liftgate, or liftgate flip-up is open, the switch state will show CLOSED. During diagnosis, if a door, liftgate, or liftgate flip-up is closed and the DRBIII® displays the switch state as CLOSED, it indicates a shorted ajar circuit. If the door, liftgate, or liftgate flip-up is open and the DRBIII® displays the switch state as OPEN, it indicates an open ajar circuit.

3.7 DOOR MODULES

A multiplexed door module is located on each front door, driver door (DDM) and passenger door (PDM). They control the following features: power door locks, automatic (rolling) door locks, driver window express down, memory recall functions (adjustable pedals, memory seats and mirrors), remote keyless entry, power mirrors, heated mirrors, door key cylinder disarm (driver door only), door lock inhibit and auto unlock on exit. Reduced wiring complexity is a key advantage of using multiplexed door modules. These modules are addressable with the DRBIII® from the "Body" menu to facilitate faster and easier diagnosis.

3.7.1 POWER WINDOWS

The power windows can be raised or lowered from the driver's door module (DDM) or the individual door switch. The DDM has a lock out switch that prevents the windows from being operated from any switch except the driver's door. When the switch is pressed, it also shuts off the individual door switch LED's.

A feature of this system allows the windows to be operated from any window switch for 45 seconds after the ignition is turned off, provided a front door is not opened. Another feature is the "Express Down" driver door only. When the driver presses the down switch to the second detent, the window will travel all the way down even if the switch is released. To stop the window travel, simply press the switch momentarily in either direction.

Twelve volts are provided on the rear window motor circuit on both the up and down circuits. The appropriate door module supplies this voltage. When the rear switch is pressed, the supply circuit to one side of the switch is opened and ground is provided making a complete circuit and therefore operating the window motor.

3.7.2 POWER DOOR LOCKS

The power door locks are operated four different ways:

1. Front door lock switches
2. Auto (rolling) door lock feature (vehicle speed above 15 MPH (24 kmh) and all doors closed).
3. Auto unlock on exit (vehicle stopped after auto door locks had locked the doors, transmission in neutral or park and the drivers door is opened - all doors will unlock).
4. Remote Keyless Entry (RKE)

3.7.3 DOOR LOCK INHIBIT

When the key is in the ignition and in the off position, and either front door is opened, the lock switch on that door is disabled. The unlock switch is still functional. This protects against locking the vehicle with the keys still in the ignition. For example, if the driver's door is opened and the passenger front door closed, the locks are operational from the passenger door switch.

3.7.4 REMOTE KEYLESS ENTRY

When the lock button on the transmitter is pressed, all locks will lock, illuminated entry will be turned off, (providing all doors are closed) and the vehicle theft security system (if equipped) will be armed. When the unlock button on the transmitter is pressed one time, the driver front door will unlock, the illuminated entry will turn on the courtesy lamps, the vehicle theft security system (if equipped) will be disarmed. When the button is pressed a second time, the other doors will unlock. This feature is programmable to open all doors on one press using the EVIC or the DRBIII®.

The passenger door module (PDM) contains the RKE receiver. When the PDM receives a valid signal from the RKE transmitter, it will send a signal on the PCI bus to lock or unlock the doors. The RKE transmitter uses radio frequency signals to communicate with the RKE receiver. If vehicle is equipped with the memory system, the memory message will be received as to which transmitter sent the signal (1 or 2).

3.7.4.1 PANIC FUNCTION

When the panic button on the RKE transmitter is pressed it pulsates the headlamp, hazard lamps and horn relays and actuates the courtesy lamp relay. By pressing the button again the horn and exterior lamps will stop but the courtesy lamps will remain on until the BCM times them out or the ignition is turned on. The panic feature is able to be set if the ignition is on but only if the panic button is pressed prior to the vehicle being started, it will continue for three minutes or until the vehicle has reached a speed of 15 MPH, if not canceled by the operator.

Actuating the headlamp, horn, hazard lamps and courtesy lamp relays with the DRBIII® will verify that the circuits and the body control module are OK. If the panic feature is still inoperable with both transmitters, replacement of the passenger door module will be necessary. If the function is inoperable with just one transmitter, then it is obvious that the transmitter must be replaced.

3.7.5 ROLLING CODE

The rolling code feature changes part of the transmitter message each time that it is used. The transmitter message and the receiver message increment together. Under certain conditions with a rolling code system (pressing a button on the RKE transmitter over 255 times outside the receiver range, battery replacement, etc.), the receiver and transmitter can fall out of synchronization. Note: The lock function works from the RKE keyfob even in out of synchronization condition and therefore it could be verified by pressing the LOCK button on the RKE keyfob. To re-synchronize, press and release the UNLOCK button on the RKE keyfob repeatedly (it may take up to eight cycles) while listening carefully for the power door locks in the vehicle to cycle, indicating that re-synchronization has occurred.

3.7.6 PROGRAMMABLE DOOR LOCK FEATURES

- The RKE can be changed to unlock all doors with one press
- The Automatic Door Locks can be enabled/disabled
- Auto Unlock on Exit can be enabled/disabled
- RKE horn chirp on lock can be enabled/disabled
- RKE optical chirp (turn signal lamps) can be enabled/disabled
- Program a new RKE transmitter (DRBIII® only)
- RKE linked to memory (if equipped with memory system) enabled/disabled (DRBIII® only). Allows memory to be operable only from the driver door switch.

3.8 ELECTRONIC VEHICLE INFORMATION CENTER

The Electronic Vehicle Information Center (EVIC) is located in the overhead console. The EVIC supplements the standard vehicle instrumentation. The EVIC uses a vacuum fluorescent (VF) display to supply the vehicle operator with a compass reading, outdoor temperature, average fuel economy, distance to empty, instantaneous fuel economy, trip odometer, elapsed ignition on time, distance to service, warning messages, service messages and memory system messages. It also provides an interface to enable and disable vehicle programmable features. If equipped, the EVIC is also available with an integrated Universal Garage Door Opener (UGDO) known as HomeLink®. Also if equipped, the EVIC is available with a Tire Pressure Monitoring (TPM) System.

The EVIC function buttons are labeled C/T, RESET, STEP, and MENU. The three UGDO buttons are labeled with dots to indicate the channel number.

The BCM supplies most of the information displayed by the EVIC. Display information is received over the PCI bus. The EVIC sends and receives data over the PCI bus, communicating with the BCM, PCM, and the Instrument Cluster. Tire Pressure Monitoring System information is received by the EVIC in the form of radio transmissions. The tire pressure sensors are mounted to the vehicle wheels. For complete information, refer to the Tire Pressure Monitoring System section in this publication.

3.8.1 VEHICLE INFORMATION DISPLAY

The EVIC provides the following functions:

- Compass direction
- Outside temperature
- Elapsed ignition on time
- Distance to empty
- Average fuel economy
- Instantaneous fuel economy
- Trip odometer
- Distance to service
- Driver alert messages:
  - TURN SIGNAL ON (with vehicle graphic)
  - PERFORM SERVICE
  - DOOR OPEN (individual or multiple doors, with graphic)
  - LIFTGATE OPEN (with graphic)
  - LIFTGLASS OPEN (with graphic)
  - COOLANT LEVEL LOW (with graphic)

– WASHER FLUID LOW (with graphic)

An audible chime or chimes will accompany any displayed warning messages. Chime requests with an OPEN message are dependent upon vehicle speed.

The EVIC will not display information for any of the screens for which it did not receive the proper PCI bus data. Refer to the symptom list in the Overhead Console section for problems related to the EVIC.

The EVIC receives the following messages from the Body Control Module (BCM):

- Verification of US/Metric status
- VF display dimming brightness and exterior lamp status
- Trip Odometer data
- Elapsed Ignition On Time data
- Fuel Economy (Average and Instantaneous)
- Distance to Empty
- Outside Temperature
- Distance to service
- Driver warning messages

The EVIC transmits the following messages to the BCM:

- Status Request: Beep, Reset, US/M Toggle
- Current Display

The EVIC receives the following message from the PCM:

- Vehicle Speed

3.8.2 STEP BUTTON

The STEP Button can be used in one of the following three ways:

1) To sequentially select one of seven displays or blank display in the following order:

- Average Fuel Economy
- Distance to Empty
- Instantaneous Fuel Economy
- Trip Odometer
- Time Elapsed
- Distance to Service Message
- Individual Tire Pressure
- Off (Blank)

2) To set the magnetic variance zone when VARIANCE = X (X = 1 - 15) is indicated in the VF Display.

3) To select the displayed programmable feature setting.

3.8.3 MENU BUTTON

Use the MENU button to sequentially step the EVIC through the programmable features.

Use the MENU button to enter the Tire Pressure Monitoring (TPM) Training Procedure.

3.8.4 RESET BUTTON

The RESET Button has two different functions:

1) To clear the trip functions that may be reset

2) To enter and exit the diagnostic mode

Pressing the RESET button once will clear the trip function that is currently being displayed (except Distance to Service) and the EVIC will send a PCI bus beep request to the BCM. If the RESET button is pressed again within 3 seconds, the EVIC will reset ALL of the trip functions and an additional beep request is sent to the BCM. The trip functions that may be reset are:

- Average Fuel Economy
- Trip Odometer
- Elapsed Time

A reset will only occur if one of the trip functions that may be reset is currently being displayed.

Pressing the RESET button for more than three (3) seconds resets the Distance to Service function while the Distance to Service message is being displayed. The EVIC module will send a beep request to the BCM.

Simultaneously pressing the RESET button and the C/T button while turning the ignition from Off to On will enter the EVIC into the self-diagnostic mode.

3.8.5 COMPASS/TEMPERATURE (C/T) BUTTON

Actuating the Compass/Temperature Button (C/T) will cause the EVIC to display the compass and temperature information. This function will operate from another traveler display or from the programmable feature mode.

3.8.6 TRAVELER DISPLAY FUNCTIONS

Using the STEP button will change the EVIC between modes of operation and display the appropriate information according to data received from the PCI Bus.

3.8.7 COMPASS/TEMPERATURE

The EVIC simultaneously displays the compass reading and the outside temperature. Outside temperature information is received via the PCI bus from the BCM.

The EVIC module internally senses and calculates the compass direction.

3.8.8 COMPASS OPERATION

Upon ignition on, if the calibration information stored in the EVIC memory is within the normal range, the EVIC will perform in slow Auto-Cal mode. In slow Auto-Cal mode, the EVIC continuously compensates for the slowly changing magnetic field of the vehicle. The compass module detects changes in the vehicle magnetism and makes appropriate internal corrections to ensure proper displayed direction.

However, if the calibration information stored in the EVIC memory is not within the normal range at ignition on, the EVIC will enter fast Auto-Cal. CAL is displayed along with the temperature.

Auto activation of the fast Auto-Cal mode will also occur when the EVIC is subjected to high magnetic field strength levels, which cause all compass readings to be erroneous for a continuous period of five (5) minutes. During fast Auto-Cal, CAL will be displayed along with the temperature.

Fast Auto-Cal can also be performed manually, by pressing and holding the RESET button for 10 seconds during the Compass/Temperature display mode.

3.8.9 SETTING MAGNETIC ZONE VARIANCE

Variance is the difference between magnetic North and geographic North. For proper compass function, the correct variance zone must be set. Refer to the Zone Variance map for the correct zone. Follow these steps to check or change the variance zone:

- The ignition switch must be in the On position and the EVIC display must not be blank.
- If the compass/temperature data is not currently being displayed, momentarily press and release the C/T button to display compass/temp information.
- Press and hold the RESET button until VARIANCE = XX is displayed. The EVIC will display the variance zone stored in memory and the word VARIANCE.
- Use the STEP button to select the proper variance zone number, 1 through 15.
- After selecting the proper zone number, momentarily press and release the RESET button. The variance zone is then stored in the memory and the EVIC returns to normal operation.

3.8.10 COMPASS CALIBRATION

The compass module has 2 types of auto-calibration; slow-cal and fast-cal. Slow-cal ensures that during normal vehicle operation the compass performs auto-calibration functions to keep the compass sensors in their proper operating range. Whenever the ignition is On and the EVIC receives PCI bus data indicating that engine RPM is greater than zero, auto-calibration is performed continuously.

If the calibration information stored in the compass module memory is not within the normal range after a power-up cycle, the compass will display CAL. The EVIC will enter into the fast-cal mode until calibration is complete.

To enter the compass into Manual Calibration mode, perform the following steps:

- Drive the vehicle to an area away from any large metal objects or overhead power lines.
- Ensure that the proper variance zone is selected. See ″Setting Magnetic Zone Variance.″
- The ignition switch must be in the On position and the EVIC display must not be blank.
- Press the C/T button to view the Compass/Temperature display.
- Press and hold the RESET button until CAL is displayed, then release the button.
- Drive slowly, less than 5 MPH (8KPH) in at least 1 complete 360 degree circle.
- CAL will remain illuminated to alert the driver that the compass is in the calibration mode.
- After calibration is complete, CAL will turn off.

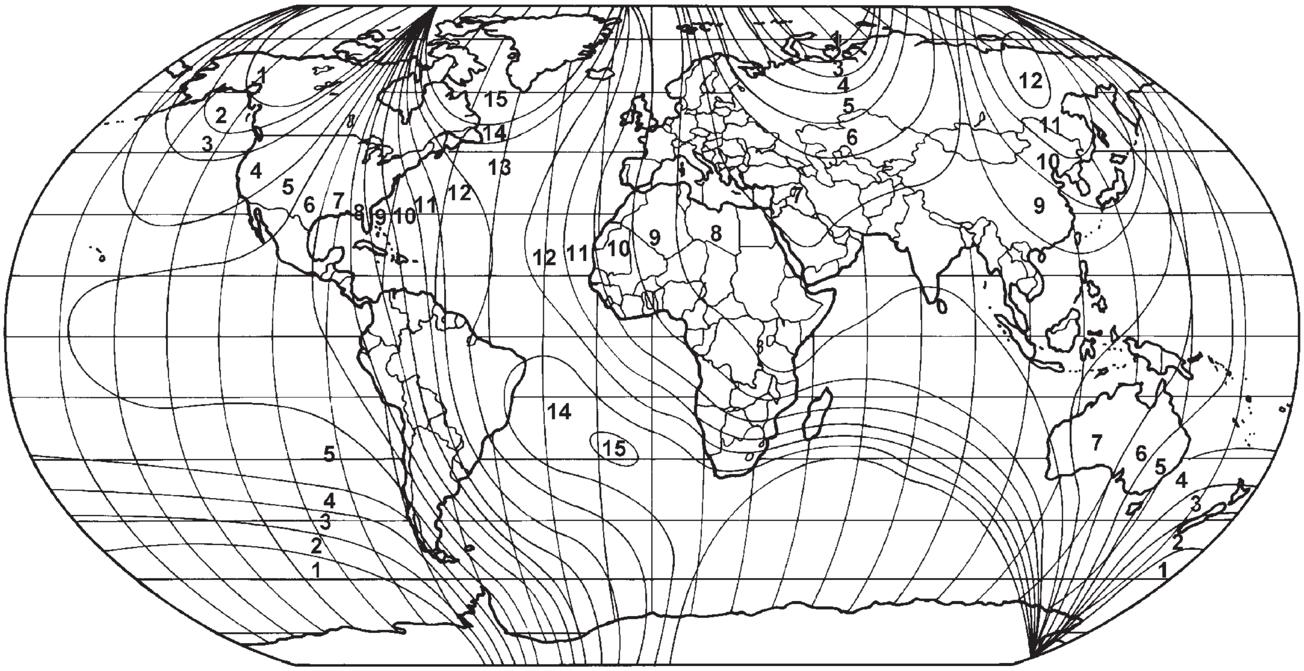
If the compass appears blank, unable to be calibrated, or the compass displays false indications, the vehicle must be demagnetized. Refer to Compass Demagnetizing Procedure in the Service Manual.

3.8.11 DIAGNOSIS AND TESTING

SELF-CHECK DIAGNOSTICS

The EVIC is capable of performing a diagnostic self check on its internal functions. EVIC diagnostics may be performed using a DRBIII(or by using the following procedure:

(1) With the ignition switch in the OFF position, depress and hold the RESET and the C/T buttons.
(2) Turn the ignition switch to the ON position.
(3) Continue to hold both buttons until the software versions are displayed, then release the buttons.
(4) All of the VFD segments will illuminate for 2-4 seconds. Check for segments that do not illuminate or illuminate all the time.



80a13863

(5) When the self-check is complete the EVIC will display one of the following messages:

- PASS SELF TEST
- FAILED SELF TEST
- NOT RECEIVING J1850 MESSAGE

(6) To exit the self-check mode, depress the RESET button or cycle the ignition switch and the EVIC will return to normal operation.

If a Communication fault is displayed, refer to the symptom list. If a FAILED is displayed, the EVIC must be replaced.

3.8.12 AMBIENT TEMPERATURE SENSOR

The ambient air temperature is monitored by the BCM and displayed by the EVIC. The BCM receives a hardwire input from the ambient temperature sensor (ATS).

The ATS is a variable resistor that operates on a 5-volt reference signal circuit hardwired from the BCM. The resistance in the ATS changes as the outside temperature rises or falls. The BCM senses the change in reference voltage through the ATS resistor. Based on the resistance of the ATS, the BCM is programmed to correspond to a specific temperature. The BCM stores and filters the ambient temperature data and transmits this data to the EVIC via the PCI Bus. The ATS cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

3.8.13 AMBIENT TEMPERATURE SENSOR FAULT CODES

The outside temperature function is supported by the ambient temperature sensor (ATS), a signal and ground circuit hardwired to the BCM, and the EVIC display.

If the EVIC display indicates 54°C (130°F) or the ATS sense circuit is shorted to ground, the temp display will be 54°C (130°F) to indicate a SHORT circuit condition.

If the EVIC display indicates -40°C (-40°F) or the ATS sense circuit is open, the temp display will be -40°C (-40°F) to indicate an OPEN circuit condition.

If there is an OPEN or SHORT circuit condition, it must be repaired before the EVIC VFD can be tested.

The ATS is supported by the BCM. Ambient Temperature Sensor DTCs will be recorded in the BCM. The ATS can be diagnosed using the following Sensor Test. Test the ATS circuits using the diagnostics in the Body Diagnostic Procedures Manual. If the EVIC passes the self test, and the ATS, the circuits, and PCI bus communications are confirmed to be OK, but the EVIC temperature display is inoperative or incorrect, replace the BCM.

3.8.14 AMBIENT TEMPERATURE SENSOR TEST

(1) Turn the ignition OFF.

(2) Disconnect the ATS harness connector.

(3) Measure the resistance of the ATS using the following min/max values:

- 0° C (32° F) Sensor Resistance = 29.33 - 35.99 Kilohms
- 10° C (50° F) Sensor Resistance = 17.99 - 21.81 Kilohms
- 20° C (68° F) Sensor Resistance = 11.37 - 13.61 Kilohms
- 25° C (77° F) Sensor Resistance = 9.12 - 10.86 Kilohms
- 30° C (86° F) Sensor Resistance = 7.37 - 8.75 Kilohms
- 40° C (104° F) Sensor Resistance = 4.90 - 5.75 Kilohms

The sensor resistance should read between these min/max values. If the resistance values are not OK, replace the Sensor.

3.8.14 HOMELINK® UNIVERSAL TRANSMITTER

If equipped, the HomeLink® Universal Transmitter is integrated into the overhead console. For added security it will operate home security systems that use coded signals known generically as *Rolling Codes*. The overhead console display provides visual feedback to the driver, indicating which HomeLink® transmitter channel button is being pressed. The HomeLink® can learn and store up to three separate transmitter radio frequency codes to operate garage door openers, security gates, and security lighting. The HomeLink® buttons are marked with one, two, or three dots. For complete information, refer to Universal Transmitter in the Service Manual or the Owner's Manual.

3.9 TIRE PRESSURE MONITORING SYSTEM (TPM)

If equipped with the Tire Pressure Monitoring System (TPM), each of the vehicles five wheels will have a valve stem with an integral pressure sensor and radio transmitter. Radio signals from the tire pressure sensor/transmitters are received and interpreted by the Electronic Vehicle Information Center (EVIC).

A sensor/transmitter in a mounted wheel will broadcast its detected pressure once per minute when the vehicle speed is greater than 40 km/h (25 mph). The spare tire sensor will broadcast once every hour. Each sensor's broadcast is uniquely coded so that the EVIC can determine location. The individual tire pressures can be displayed graphically on the EVIC.

3.9.1 TRAINING THE EVIC

The EVIC can be trained to recognize the source locations of pressure sensor/transmitter signals. Use the following training procedure:

(1) Locate "RETRAIN TIRE SENSORS" on the EVIC menu.

(2) Press STEP button to select YES and MENU button to confirm.

When this mode is enabled by selecting "YES" the EVIC will initiate the training procedure.

(3) The EVIC display will prompt the user to: "TRAIN LEFT FRONT TIRE". At this point the user must set the left front tire sensor to learn mode by positioning a magnet (Relearn Magnet special tool 8821) over the valve stem for at least 5 seconds. The Remote Tire Pressure Monitor (RTPM) in the front left tire will transmit a message indicating to the EVIC that it is in learn mode. When the EVIC has received this message and is assured that it has learned an ID, the EVIC will request a horn chirp via a bus message and then display the next train request. Note: There is a 60-second timer for learning the first tire location and a 30-second timer between the remaining tires. If any of these timers expire the EVIC will abort the training procedure.

(4) The EVIC will request the initiation of a training sequence for each tire, one-by-one in a clockwise direction around the vehicle (Left Front, Right Front, Right Rear, Left Rear, and Spare). The EVIC will allow 30 seconds (60 seconds for the first tire) from the beginning of the train request display to the receipt of a unique learn ID message from the RTPM. If, during a training session, a 60 or 30 second timer expires before a unique learn sensor ID is received or the vehicle is not in park, the EVIC will keep the previous set of trained IDs and will display "TRAINING ABORTED" until a button is pressed. Any IDs learned during the current session will be discarded. The EVIC will not store one ID for multiple locations.

(5) Once all five tires are successfully trained, the previous set of stored IDs will be replaced by the new IDs, and the EVIC will display "TRAINING COMPLETE" until a button is pressed.

If the vehicle is equipped with the HomeLink® feature and a HomeLink® button is pressed at any time during the training procedure, the EVIC module will immediately exit the training procedure, discard any IDs learned in the current session and perform the HomeLink® function. After the button is released, the module will display "RETRAIN TIRE SENSORS? NO".

The training procedure can be stopped at any time by pressing the C/T, STEP, RESET or MENU button. When any of these buttons are pressed the EVIC will display “TRAINING ABORTED” until another button is pressed.

Once training is complete, the EVIC can determine when the spare wheel has been mounted on the vehicle. The spare wheel sensor/transmitter is expected to transmit once per hour. If the sensor/transmitter ID for the spare wheel is received at a shorter interval, the EVIC will request a chime and display “SPARE SWAP DETECTED” for five seconds.

3.9.2 PRESSURE THRESHOLDS

The EVIC will monitor the tire pressure signals from the five tire sensor/transmitters and determine if any tire has gone below the Low Pressure Threshold or raised above the High Pressure Threshold. Refer to the table below.

LOW TIRE PRESSURE THRESHOLDS	
SYSTEM STATUS INDICATOR	TIRE PRESSURE
On	172 kPa (25 PSI)
Off	193 kPa (28 PSI)

HIGH TIRE PRESSURE THRESHOLDS	
SYSTEM STATUS INDICATOR	TIRE PRESSURE
On	310 kPa (45 PSI)
Off	276 kPa (40 PSI)

3.9.3 CRITICAL AND NON-CRITICAL PRESSURE ALERTS

A critical alert will be triggered when a tire pressure has gone below or above a set threshold pressure. Depending on what the condition is, the EVIC will request a chime and then display a LOW PRESSURE or HIGH PRESSURE message indicating the appropriate location.

The alert message will display for three seconds and then switch to the tire pressure trip screen. The tire pressure for the tire that has exceeded its threshold will blink at one second intervals on the graphic display. The blinking tire pressure will continue for the rest of the ignition cycle or until an EVIC button is pressed. If the display is removed without correcting the condition, it will reappear without a chime after 60 seconds to warn the driver of the low/high pressure condition.

A non-critical alert will be triggered when low or high pressure threshold has been exceeded in the spare tire. The “SPARE LOW PRESSURE” or “SPARE HIGH PRESSURE” alert will be displayed for 60 seconds during each ignition ON cycle. If the pressure threshold is exceeded while the ignition is OFF, the alert will be delayed 8-10 seconds after ignition ON.

3.9.4 SYSTEM FAULTS

NOTE: The Remote Tire Pressure Monitor Sensors (RTPM) are not internally serviceable. For a Sensor Failure or Low Battery fault, the RTPM must be replaced.

There are four conditions that will cause a Tire Pressure Monitoring System fault to be set. All fault codes are associated with a specific wheel location.

1. If the EVIC detects a non-transmitting Sensor/Transmitter in a road wheel for 10 minutes at a vehicle speed above 40 Km/H (25 MPH), it will:
   a. Store an active fault code.
   b. Request a chime.
   c. Display “SERVICE TIRE PRESS SYSTEM”.
   d. Display a dashed line at the wheel location on the graphic display if the display is activated.
2. When the EVIC detects:

- A low pressure sensor/transmitter battery status for 7 consecutive ignition cycles,
- Any sensor transmitting at a shorter than expected interval or,
- No valid pressure sensor ID from the spare tire for 20 consecutive ignition cycles spaced at least one hour apart, it will:
  a. Store an active fault code.
  b. Request a chime.
  c. Display “SERVICE TIRE PRESS SYSTEM”.

Use the DRBIII® Input/Output function to further isolate the specific concern.

The DRBIII® can be queried to determine the Sensor/Transmitter status:

- “Invalid Pressure” - The Sensor/Transmitter is reporting a negative pressure or a pressure above 434 kPa (63 psi).
- “Low Batt” - The Sensor/Transmitter has reported a low battery status for seven consecutive ignition cycles.
- “Trained” - The Sensor/Transmitter ID code is recognized by the EVIC.
- “Active” - The vehicle is moving at 40 km/h (25 mph) and the Sensor/Transmitter is “awake” and transmitting as expected by the EVIC.

3.9.5 SPARE WHEEL AUTO-LOCATE

If the spare tire is mounted on the vehicle, the EVIC will detect the relocation and determine from the sensor transmit intervals, which wheels are mounted and which one is now the spare. The spare tire sensor/transmitter transmits once per hour. The sensor/transmitters in the mounted wheels transmit once per minute when the vehicle is moving at 40 km/h (25 mph).

3.9.6 REMOVE MAGNET FROM SPARE

A magnet is used to initiate a sensor ID transmission. In the EVIC training procedure, the spare wheel is the last in the sequence. If the magnet is left on the wheel, the sensor/transmitter will continue its ID transmission. If the EVIC detects 20 transmissions from the spare wheel in 60 seconds and the vehicle speed is above 40 km/h (25 mph), it will:

- Request a chime.
- Display "REMOVE MAGNET FROM SPARE" for 60 seconds per ignition-ON cycle.

3.9.6 TIRE PRESSURE UNAVAILABLE

The EVIC can detect high radio noise interference. When the noise level is too high to distinguish a transmission from a sensor/transmitter, it will:

- Display "TIRE PRESSURE UNAVAILABLE" for 5 seconds.
- Request a chime.
- Switch to the graphic display and show dashed lines instead of the tire pressure for the wheel(s) affected by the radio interference.

3.9.7 TIRE PRESSURE NOW AVAILABLE

If the "TIRE PRESSURE UNAVAILABLE" message was displayed because of radio noise interference, the EVIC will:

- Display "TIRE PRESSURE NOW AVAILABLE" for 5 seconds.
- Request a chime.

When the noise level no longer interferes with sensor/transmitter transmissions.

3.9.8 DIAGNOSING AND CLEARING SYSTEM FAULTS

NOTE: The TPM System relearn procedure must be performed before servicing the system.

All Tire Pressure Monitoring System Faults are specific to one location. If a "BATTERY LOW", "SENSOR FAILURE" fault is detected, the location will be displayed. The appropriate sensor/ transmitter can then be replaced.

If a single sensor/transmitter cannot be detected by the EVIC, replace that sensor transmitter. If none of the sensors/transmitters can be detected, refer to Tire Pressure Monitoring System symptoms in the EVIC section.

3.9.9 SYSTEM TEST

A test of the Tire Pressure Monitoring System can be initiated in the EVIC. The test sequence is as follows:

1) Scroll to the blank display by pressing the STEP button.
2) Press and hold the RESET button for five seconds.
3) The EVIC will request a beep to indicate the start of the test.
4) The EVIC will clear the sensor signal counters
5) The vehicle graphic will be displayed with transmission counters at each corner and for the spare. (Same display as for pressures but with counters in place of the tire pressures.)
6) Drive the vehicle at speeds above 40 km/h (25 mph) for 10 minutes.
7) The counters will increase by one each time a sensor signal is received by the EVIC (approximately 1 signal per minute from each wheel except the spare).

The test will continue until any EVIC button is pressed or until the ignition is cycled to OFF.

3.9 EXTERIOR LIGHTING SYSTEM

3.9.1 EXTERIOR LIGHTING BATTERY SAVER

The BCM monitors the status of and controls the park lamp, head lamp and fog lamp relay's. If any exterior lamps are left on after the ignition is turned off, the BCM will turn them off after 8 minutes.

3.9.2 HEADLAMP DELAY

The headlamp time delay operates when the ignition switch is turned off while the headlamps are still on. This feature is customer programmable to provide a 30, 60 or 90 second time delay before turning off the headlamps. This feature can also be disabled.

3.9.3 HEADLAMP SWITCH

The headlight switch on WJ vehicles uses a multiplexed (MUX) circuit to the BCM. The BCM will then control the park lamp, low/high head lamp and fog lamp relay's based on this input.

3.9.4 FOG LAMP CONTROL

The body control module controls the operation of the fog lamp relay which controls the fog lamps. The fog lamps can only be on if the park or low beam headlamps are on. If the high beams are turned on, the fog lamps will automatically be turned off.

3.10 INTERIOR LIGHTING

3.10.1 COURTESY LAMP CONTROL

The body controller has direct control over all of the vehicle's courtesy lamps. The body computer will illuminate the courtesy lamps under any of the following conditions:

1. Any door is ajar and courtesy lamp switch on the left multi-function switch is not in the dome off position.
2. The courtesy lamp switch on the left multi-function switch is in the dome on position.
3. A Remote Keyless entry unlock message is received.
4. Driver door unlocked with key (with VTSS only).

3.10.2 ILLUMINATED ENTRY

Illuminated entry will be initiated when the customer enters the vehicle by unlocking the doors with the key fob, or with the key if the vehicle is equipped with vehicle theft alarm. Upon exiting the vehicle, if the lock button is pressed with a door open, illuminated entry will cancel when the door closes. If the doors are closed and the ignition switch is turned on, the illuminated entry also cancels. The illuminated entry feature will not operate if the courtesy lamp switch is in the dome off position.

3.10.3 INTERIOR LIGHTING BATTERY SAVER

If any of the interior lamps are left on after the ignition is turned off, the BCM will turn them off after 8 minutes. To return to normal operation, the courtesy lamps will operate after the dome lamp switch or door ajar switch changes state. The glove box, switched reading lamps and vanity lamps require that the ignition be turned to the on/acc position.

3.11 ELECTRO/MECHANICAL INSTRUMENT CLUSTER (EMIC)

The Instrument Cluster contains a Fuel, Voltmeter, Coolant Temp, and Oil Pressure gauge, a Tachometer and a Speedometer. With the exception of the Voltmeter, the cluster positions the gauges with PCI Bus messages received from the PCM. The Voltmeter operates directly off of the Fused B+ Switched Ignition Output circuit that supplies ignition voltage for the cluster.

The Instrument Cluster also contains warning indicators that are illuminated by hard wired inputs or by messages received from other modules on the PCI Bus.

The Trip/Total Odometer is a Vacuum Fluorescent Display (VF) that is controlled by PCI Bus messages received from the PCM.

The cluster illumination lamps are hard wired in the Instrument Cluster. When the Park or Headlamps are turned on, the cluster receives a dimmed battery feed from the Headlamp Switch. The cluster I/O Processor controls the VF display dimming and also sends dimming level messages on the PCI Bus.

The EMIC will communicate with the DRBIII® to display PCI Engine Info, PCI Bus Info, and certain input/outputs. Cluster diagnostic capabilities that the DRBIII® will actuate is limited to the Cluster Calibration Points for the gauges. The DRBIII® can also extract active and stored Diagnostic Trouble Codes (DTC) from the Instrument Cluster.

The EMIC is also capable of performing a diagnostic Self-Test that is actuated by depressing and holding the Odometer trip reset stalk while cycling the ignition from the off to the on position. After the cluster Odometer displays CHEC, releasing the reset stalk begins the test. The cluster will then position all of the gauges at specified calibration points and will illuminate all the PCI Bus controlled indicators. The cluster will also illuminate each segment of the VF display.

The EMIC can verify communications with the PCM, ID the module, or change the country code using the DRBIII®. For further information regarding the diagnostic routine and an explanation of the faults, refer to the appropriate Service Manual.

3.11.1 INSTRUMENT PANEL DIMMING

I/P dimming is accomplished using the body computer. The panel dimming level switch is read by the body computer which converts the level to a value that is sent over the PCI bus. Other modules such as the Radio, MIC, and the EVIC use this data so their display intensity matches the other incandescent bulbs in the vehicle that are driven directly by the BCM.

3.12 MEMORY SEATS

The memory system consists of the driver power seat, both outside rear view mirrors and the radio presets. The memory module for the seat is mounted under the driver's seat. The module is available with or without the heated seat feature. The seat module receives input from the 8-way power seat switch, the driver's seat position sensors, both front seat negative temperature coefficients (NTC's) (if heated seat equipped) and the PCI bus circuit. The memory switch, located on the driver door, is wired directly to the driver door module and sends its messages over the PCI bus. The memory seat module performs the following functions: positions the drivers seat, actuates the driver's and passenger's seat heaters (if equipped) and sends the memory location over the PCI bus.

When a memory button is pressed (#1 or #2) on the memory switch, the driver door module sends a recall message to the memory seat module (MSM), the PCI radio and the passenger door module. They will in turn position the driver seat, both mirrors and set the radio presets. When the RKE button is pressed, depending on which transmitter (#1 or #2), the passenger door module sends the recall message.

3.12.1 POWER SEAT

The memory power seat provides the driver with 2 position settings for the driver's seat. Each power seat motor is connected to the MSM with two circuits. Each circuit is switched between battery and ground. By alternating the circuits the MSM controls the movement of the motors based on input from the seat mounted switch.

Each motor contains a potentiometer to monitor the seat position. To monitor the position of the motor, the MSM sends out a 5-volt reference on the sensor supply circuit. The sensor is grounded back to the module on a common ground circuit. Based on the position of the sensor, the MSM monitors the voltage change through the sensor on a separate signal circuit.

The MSM stores the input value of each of the four seat potentiometers in memory when the system is requested. The driver can initiate memory recall, using either the memory switch or the RKE transmitter. When initiated, the MSM adjusts the four seat motors to match the memorized seat position data.

For safety reasons, the memory seat recall is disabled by the MSM when the vehicle is out of park position or if the seatbelt is buckled. Any obstruction to seat movement over a 2 second delay will cause the seat to stop moving in which case a stalled motor would be detected by the MSM which would then flag a trouble code and the corresponding seat output would be deactivated. However, if the object obstructing the seat is removed, the seat will function normally again.

3.12.2 EASY EXIT SEAT (AVAILABLE WITH MEMORY SEAT)

The intent of this feature is to allow for easier entry and exit to the vehicle by moving the seat rearward a short distance when the operator turns the vehicle off. The seat can be recalled to one of it's two set memory positions by pressing either of the memory recall buttons on the switch or the RKE transmitters. If any seat movement is initiated, whether manual or by memory recall, after the ignition has been turned off, this will cancel any ensuing glide to enter movement until the next ignition cycle.

This feature can be enabled/disabled by the owner through the electronic vehicle information center (EVIC) or using the DRBIII®. When using the DRBIII® it will also inform as to what state it is in. To reinstate the feature, simply repeat the process.

3.12.3 GUARD BANDS

The module provides guard bands which prevent the seat track from hitting the hard limits of the given seat axis during manual power seat operation. The guard band values for each hard limit are stored in EEPROM. The guard band can be bypassed by running the seat to the end of its travel and then releasing the switch and pressing it again. The seat will move a short distance further. Once the seat is past the guard band, it can be stored in memory, but if recall is initiated the seat will move to the guard bands and no further.

When a seat module or seat track assembly is replaced, the DRBIII® must be used to perform the "Reset Guard Bands" procedure. WARNING: The operator must be out of the seat when this procedure is being used as the seat will move to the end of it's travel in all 8 positions.

3.12.4 ELECTRICALLY HEATED SEATS

The heated seat feature is available with or without the memory system. The module is located under the driver's seat and is known as the heated seat module (HSM) or the memory heated seat module (MHSM). The control switches for the heated seats are located on the instrument panel and are wired to the body control module. The BCM then sends the message to the HSM via the PCI bus. The system offers two seat temperature settings of approximately 96.8 F (36°C) (LO) and approximately 107.6 F (41°C) (HI).

As the temperature in the seat rises, the negative temperature coefficient (NTC) resistance decreases and the voltage reading detected by the HSM decreases. The seat heater output is deactivated once the voltage reading reaches it's threshold for either setting, high or low.

As the temperature decreases, the voltage reading increases until the upper threshold is reached for either setting high or low. At this point the seat heat output is activated once again and this cycle repeats itself as long as the seat heat request is on.

The thresholds for low and high settings are pre-programmed into the module memory.

The heated seat switch contain resistors pulled up to 5 volts which are processed by the body control module as the voltage readings indicating desired heat setting high or low.

The heater elements inside the seat back and cushion are different for the Limited and Laredo models. The Laredo seat heater elements are wired in series whereas the Limited seat elements are wired in parallel. This means that if an element is open in a Laredo model there will be no heater output to either the cushion or the seat back. If an element is open in a Limited model, the other elements will operate as usual. However, if one of the elements is open, the seat cushion will have to be replaced.

There are three heater elements in the seat cushions for both models. The Laredo uses a resistor wire for its center and both side bolsters (raised outer side panels) and the Limited uses a carbon fiber element for its center and resistor wire for the bolsters.

3.13 SENTRY KEY IMMOBILIZER SYSTEM (SKIS)

The Sentry Key Immobilizer System (SKIS) is an immobilizer system designed to prevent unauthorized vehicle operation. The system consists of a Sentry Key Immobilizer Module (SKIM), ignition key(s) equipped with a transponder chip and engine controller. When the ignition switch is turned on, the SKIM interrogates the ignition key. If the ignition key is "Valid" the SKIM sends a PCI Bus message to the engine controller indicating the presence of a valid ignition key. Upon receiving a "Valid" key signal the PCM/ECM will allow the engine to continue to operate.

For additional information on the SKIS, refer to the appropriate Powertrain Diagnostic information.

3.14 POWER SUNROOF

The power sunroof in the Grand Cherokee is controlled by the Body Control Module (BCM). After the ignition has been turned off, the power sunroof will remain operational for an additional 45 seconds. If the front doors are opened during this time, the BCM will remove power from the sunroof.

3.15 COMMUNICATION

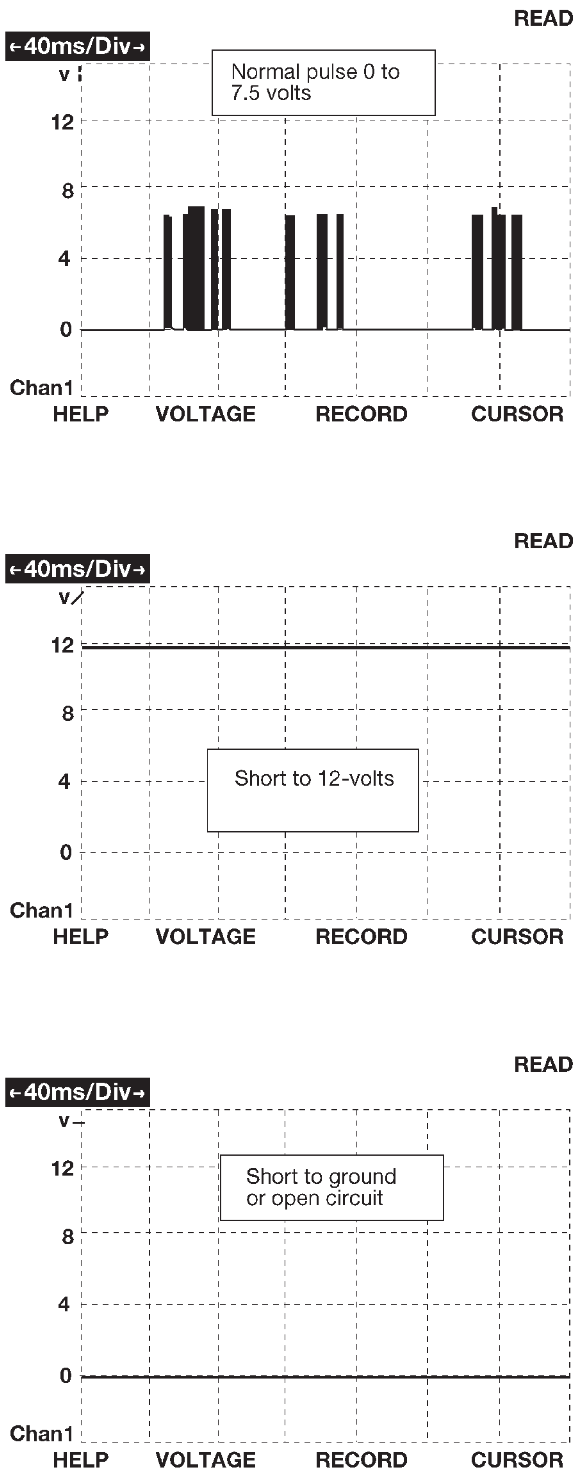
The Programmable Communication Interface or PCI Bus is a single wire multiplexed network capable of supporting binary encoded messages shared between multiple modules. The PCI bus circuit is identified as D25. The modules are wired in parallel. Connections are made in the harness using splices. One splice called the Diagnostic Junction Port, serves as the "Hub" of the bus. The Diagnostic Junction Port provides an access point to isolate most of the modules on the bus in order to assist in diagnosing the circuit. The following modules are used on the WJ/WG:

- Body Control Module
- Adjustable Pedals Module
- Door Modules (Driver & Passenger)
- Airbag Control Module
- Controller Antilock Brake
- Powertrain Control Module
- Engine Control Module (Diesel)
- Radio
- CD Changer
- Transmission Control Module
- Automatic Zone Control Module
- Sentry Key Immobilizer Module
- Seat Module
- Electronic Vehicle Information Center
- Mechanical Instrument Cluster
- Shifter Assembly (Diesel)
- Rain Sensor
- Power Amplifier
- Intrusion Transceiver Module (Export)

Each module provides its own bias and termination in order to transmit and receive messages. The bus voltage is at zero volts when no modules are transmitting and is pulled up to about seven and a half volts when modules are transmitting.

The bus messages are transmitted at a rate averaging 10800 bits per second. Since there is only voltage present when the modules transmit and the message length is only about 500 milliseconds, it is ineffective to try and measure the bus activity with a conventional voltmeter. The preferred method is to use DRBIII® lab scope. The 12v square wave selection on the 20-volt scale provides a good view of the bus activity. Voltage on the bus should pulse between zero and about seven and a half volts. Refer to the following figure for some typical displays.

The PCI Bus failure modes are broken down into two categories. Complete PCI Bus Communication Failure and individual module no response. Causes of complete PCI Bus Communication Failure include a short to ground or battery on the PCI circuit. Individual module no response can be caused by an open circuit at either the Diagnostic



80bdbcf6

Junction Port or the module, or an open battery or ground circuit to the affected module.

Symptoms of a complete PCI Bus Communication Failure would include but are not limited to:

- All gauges on the EMIC stay at zero
- All telltales on EMIC illuminate
- EMIC backlighting at full intensity
- Dashed lines in the EVIC ambient temperature display
- No response received from any module on the PCI bus (expect the PCM/ECM)
- No start (if equipped with Sentry Key Immobilizer)

Symptoms of Individual module failure could include any one or more of the above. The difference would be that at least one or more modules would respond to the DRBIII®.

Diagnosis starts with symptom identification. If a complete PCI Bus Communication Failure is suspected, begin by identifying which modules the vehicle is equipped with and then attempt to get a response from the modules with the DRBIII®. If any modules are responding, the failure is not related to the total bus, but can be caused by one or more module's PCI circuit or power supply and ground circuits. The DRBIII® may display "BUS +/- SIGNAL OPEN" or "NO RESPONSE" to indicate a communication problem. These same messages will be displayed if the vehicle is not equipped with that particular module. The CCD error message is a default message used by the DRBIII® and in no way indicates whether or not the PCI bus is operational. The message is only an indication that a module is either not responding or the vehicle is not equipped.

3.16 VEHICLE THEFT SECURITY SYSTEM

The vehicle theft security system (VTSS) is controlled by the body control module, which monitors vehicle doors, liftgate, liftglass and the ignition for unauthorized operation. The alarm activates by sounding the horn, flashing the headlamps, hazard lamps, and the VTSS indicator lamp. The VTSS does not prevent engine operation, this is done with the sentry key immobilizer module. Passive arming occurs upon normal vehicle exit by removing the ignition key, opening the driver door, locking the doors with the power lock, and closing the driver door or locking the doors with RKE. The indicator lamp on the dash will flash for 15 seconds, showing that arming is in progress. If no monitored systems are activated during this period, the system will arm and the indicator will flash at a slower rate. When something triggers the alarm, the system will signal the headlamps, park lamps, and horn for about 18 minutes.

For complaints about the Theft Alarm going off on it's own, use the DRBIII® and select "Theft Alarm", "VTSS" then "Monitor Display" and read the "Alarm Tripped By" status.

Tamper Alert - The VTSS tamper alert will sound the horn three times upon disarming to indicate a tamper condition has occurred.

Manual Override - The system will not arm if the doors are locked using the manual lock control or if the locks are actuated by an inside occupant after the doors are closed.

To verify the system, proceed as follows:

1. Open the driver's door.
2. Remove the ignition key (but keep it in hand).
3. Lock the doors with the power lock switch or the RKE.
4. Close the driver's door.

NOTE: After the doors are closed, locking the doors with RKE will also arm the system.

NOTE: If the VTSS indicator lamp flashed, the system is operational and verified. If not, there may be a problem with the system.

Arming/Disarming - Active arming occurs when the remote keyless entry transmitter is used to lock the vehicle doors, whether the doors are open or closed. If one or more doors are open, the arming sequence is completed only after all doors are closed.

Passive disarming occurs upon normal vehicle entry (unlocking driver's door with the key). This disarming also will halt the alarm once it has been activated.

Active disarming occurs when the remote keyless entry transmitter is used to unlock the vehicle doors. This disarming also will halt the alarm once it has been activated.

Intrusion Transceiver Module (Export only)

The Body Control Module (BCM) along with an Intrusion Transceiver Module (ITM) will control the premium Vehicle Theft Security System (VTSS) on export vehicles. Premium VTSS also includes a battery-backed siren for the audible alert. In addition to the other features of the base VTSS the ITM is used to monitor the interior of the vehicle for movement while the alarm is set. This feature can also be disabled with three additional lock commands from the Remote Keyless Entry system (which will be confirmed with an audible chirp) during the VTSS pre-arming sequence.

When the alarm is tripped it will actuate the hazard lamps for twenty-five seconds and the siren twenty-eight seconds. After that period if the disturbance is still present only the siren will be activated again for twenty-eight seconds with five seconds intervals between warning cycles. This will continue up to ten times unless the disturbance goes away. Also while the alarm is set the siren will monitor it's Fused B(+) and Siren Signal Control circuits. If either of these circuits become open the siren will trip itself to the alarming state.

NOTE: The intrusion transceiver module and/or siren must never be swapped from one vehicle to another. Once connected to a particular vehicle they will only properly function for that vehicle.

NOTE: If the VTSS indicator lamp comes on after ignition on and stays on, the PCI bus communication with the powertrain control module possibly has been lost.

3.17 WINDSHIELD WIPER & WASHER

3.17.1 FRONT WIPER

System Description

The front wiper system consists of the following features: *lo-hi-speed, mist wipers, intermittent wipers, and wipe after wash*. The front wiper system is only active when the ignition is in the run/acc position.

The BCM controls the front wiper system with one low-going output to a relay. With this output the BCM determines the motor wipe rate. This rate is a function of the intermittent wiper switch position and vehicle speed. The BCM times the delay after the wipers have parked. If the driver goes from a longer to a shorter delay interval, a wipe is done immediately. The speed sensitive delay is set based on the current speed of the vehicle. If the vehicle crosses above the speed threshold of 10 MPH (16 kmh) while the intermittent wiper delay is occurring, a smaller delay can be used. If the vehicle crosses below the speed threshold a longer delay should not be used until the current delay is completed.

In the lo-hi and mist state, the BCM constantly outputs an active control signal for a delay of zero. The multifunction switch controls the wiper high/low relay wiper motor in the hi state. This is done with an additional output from the multifunction switch to a relay which selects the motor winding to be energized. The BCM does not distinguish between lo-hi-or mist positions. The mist position is a momentary input to the BCM which causes the wipers to operate at low speed as long as the mist input is present.

The BCM also monitors the front washer motor to perform wipe after wash. The BCM will perform 3 wipes after the wash input is released.

Since the front wiper system is an important safety feature, the BCM will support wiper operation in the event of a failed park input.

If BCM does not detect a change of state on the park input for 8 seconds with the wiper relay energized a Diagnostic Trouble Code will set in the BCM.

Once a failed park switch is detected, intermittent operation is disabled and the BCM will default to the low speed wiper state when the wiper switch is in the intermittent position. The wiper relay will be de-energized when the wiper mode switch is in the OFF position. For open and short states on the wiper mode switch, the wipers should default to OFF.

SYSTEM FEATURES

Rain Sensor Module
The Microprocessor-based Rain Sensor Module (RSM) senses moisture on the outside of the windshield glass, and sends a wipe command to the Body Control Module (BCM). The RSM sends a wipe command to the BCM over the PCI data bus. The BCM then activates or deactivates the front wiper system. Sensitivity inputs are based on the driver-selected settings on the right side multi-function switch.

Speed Sensitive Intermittent Wipe Mode
There are 5 individual delay times with a minimum delay of 1/2 second to a maximum of 18 seconds. When the vehicle speed is under 10 MPH (16 kmh), the delay time is doubled providing a range of 1 second to 36 seconds.

Mist Wipe
The wiper operates as long as the wiper switch is in the mist position.

Park after Ignition Off
Because the wiper relays are powered from the battery the BCM can run the wipers to park after the ignition is turned off.

Wipe after Wash
When the driver presses the wash button and then releases it, the wiper will continue to run for 3 additional wipe cycles.

The wiper system utilizes the BCM to control the on/off relay for low wiper functions, intermittent wiper delay as the switch position changes, pulse wipe, wipe after wash mode, and wiper motor park functions. The BCM uses the vehicle speed input to double the usual delay time below 10 MPH (16 kmh).

FRONT/REAR WIPER AND WASHER SWITCHES (RIGHT MULTI-FUNCTION SWITCH STALK)

The front windshield and rear liftglass wiper/washer switches are located on the wiper multi-function switch stalk which is secured to the right side of the multi-function switch mounting housing on the steering column.

A knob on the end of the wiper multifunction switch stalk is rotated to select the desired front wiper speed (HIGH or LOW) or one of the five intermittent front wiper positions. The wiper stalk is pulled toward the driver to activate the windshield washer system. Both the front wiper and front washer motors will operate continuously for as long as the stalk is held in the momentary FRONT WASH position.

Another rotary switch on the wiper multi-function switch stalk is rotated to select the desired rear wiper speed (ON or DELAY). The wiper stalk is pushed toward the instrument panel to activate the rear liftglass washer system. Both the rear wiper and rear washer motors will operate continuously for as long as the stalk is held in the momentary REAR WASH position.

If any part of the right multi-function switch stalk is faulty or damaged, the entire wiper multi-function switch assembly must be replaced.

3.17.2 REAR WIPER SYSTEM

Five circuits feed the rear wiper module. It has two high current circuits, battery (B+) and ground, that run the motor. The remaining three circuits are low current control circuits.

Two of these circuits come from the rear wiper switch on the right multi-function switch stalk. These circuits are referred to as the rear wiper motor control circuit and the rear wiper motor intermittent control circuit. When the rear wiper switch is in the Off position, both of these circuits are open and the wiper module parks or remains parked. When the rear wiper switch is in the Intermittent position, the intermittent control circuit is switched to ignition voltage, the motor control circuit is open and the wiper is in the intermittent modes. When the rear wiper switch is in the On position, the intermittent control circuit is open and the motor control circuit is switched to ignition voltage and the wiper is in continuous wipe mode.

REAR WIPER SYSTEM CONTROL CIRCUITS

REAR WIPER SWITCH POSITION	DELAY CIRCUIT	CONTINU-OUS CIR-CUIT	AJAR CIRCUIT	WIPER MODE
OFF	*OPEN*	*OPEN*	*OPEN*	PARKED
	OPEN	*OPEN*	*GROUND*	PARKED
DEL	*IGNITION*	*OPEN*	*OPEN*	DELAY
	IGNITION	*OPEN*	*GROUND*	PARKED
ON	*OPEN*	*IGNITION*	*OPEN*	ON
	OPEN	*IGNITION*	*GROUND*	PARKED
WASH	*IGNITON*	*IGNITION*	*OPEN*	WASH
	IGNITION	*IGNITION*	*GROUND*	PARKED

The third control circuit is the AJAR circuit. This circuit is fed by the flip-up glass ajar switch. When the flip-up glass is closed the ajar switch is open and the rear wiper module functions normally. When the flip-up glass is open, the ajar switch is closed and the circuit provides ground to the module. This ground signal indicates to the rear wiper module that it should park if operating or not allow operation if parked.

3.18 USING THE DRBIII®

Refer to the DRBIII® user's guide for instructions and assistance with reading trouble codes, erasing trouble codes and other DRBIII® functions.

3.18.1 DRBIII® ERROR MESSAGES AND BLANK SCREEN

Under normal operation, the DRBIII® will display one of only two error messages:

– User-Requested WARM Boot or User-Requested COLD Boot

If the DRBIII® should display any other error message, record the entire display and call the STAR Center for information and assistance. This is a sample of such an error message display:

```
ver: 2.14
date: 26 Jul93
file: key_itf.cc
date: Jul 26 1993
line: 548
err: 0x1
User-Requested COLD Boot

Press MORE to switch between this display
   and the application screen.
Press F4 when done noting information.
```

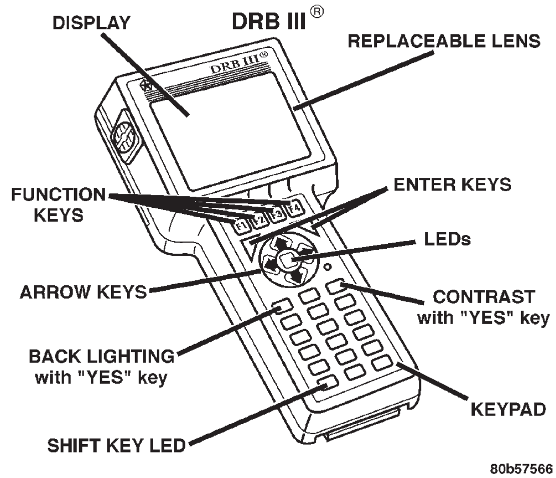
3.18.2 DRBIII® DOES NOT POWER UP

If the LED's do not light or no sound is emitted at start up, check for loose cable connections or a bad cable. Check the vehicle battery voltage (data link connector cavity 16). A minimum of 11 volts is required to adequately power the DRBIII®.

If all connections are proper between the DRBIII® and the vehicle or other devices, and the vehicle battery is fully charged, and inoperative DRBIII® may be the result of faulty cable or vehicle wiring.

3.18.3 DISPLAY IS NOT VISIBLE

Low temperatures will affect the visibility of the display. Adjust the contrast to compensate for this condition.



4.0 DISCLAIMERS, SAFETY, WARNINGS

4.1 DISCLAIMERS

All information, illustrations, and specifications contained in this manual are based on the latest information available at the time of publication. The right is reserved to make changes at any time without notice.

4.2 SAFETY

4.2.1 TECHNICIAN SAFETY INFORMATION

WARNING: ENGINES PRODUCE CARBON MONOXIDE THAT IS ODORLESS, CAUSES SLOWER REACTION TIME, AND CAN LEAD TO SERIOUS INJURY. WHEN THE ENGINE IS OPERATING, KEEP SERVICE AREAS WELL VENTILATED OR ATTACH THE VEHICLE EXHAUST SYSTEM TO THE SHOP EXHAUST REMOVAL SYSTEM.

Set the parking brake and block the wheels before testing or repairing the vehicle. It is especially important to block the wheels on front-wheel drive vehicles; the parking brake does not hold the drive wheels.

When servicing a vehicle, always wear eye protection, and remove any metal jewelry such as rings, watchbands or bracelets that might make an inadvertent electrical contact.

When diagnosing a body system problem, it is important to follow approved procedures where applicable. These procedures can be found in this General Information Section or in service manual procedures. Following these procedures is very important to the safety of individuals performing diagnostic tests.

4.2.2 VEHICLE PREPARATION FOR TESTING

Make sure the vehicle being tested has a fully charged battery. If it does not, false diagnostic codes or error messages may occur.

4.2.3 SERVICING SUB-ASSEMBLIES

Some components of the body system are intended to be serviced as an assembly only. Attempting to remove or repair certain system subcomponents may result in personal injury and/or improper system operation. Only those components with approved repair and installation procedures in the service manual should be serviced.

4.2.4 DRBIII® SAFETY INFORMATION

WARNING: EXCEEDING THE LIMITS OF THE DRBIII® MULTIMETER IS DANGEROUS. IT CAN EXPOSE YOU TO SERIOUS OR POSSIBLY FATAL INJURY. CAREFULLY READ AND UNDERSTAND THE CAUTIONS AND THE SPECIFICATION LIMITS.

- Follow the vehicle manufacturer's service specifications at all times.
- Do not use the DRBIII® if it has been damaged.
- Do not use the test leads if the insulation is damaged or if metal is exposed.
- To avoid electrical shock, do not touch the test leads, tips, or the circuit being tested.
- Choose the proper range and function for the measurement. Do not try voltage or current measurements that may exceed the rated capacity.
- Do not exceed the limits shown in the table below:

FUNCTION	INPUT LIMIT
Volts	0 - 500 peak volts AC 0 - 500 volts DC
Ohms (resistance)*	0 - 1.12 megohms
Frequency Measured Frequency Generated	0 - 10 kHz
Temperature	-58 - 1100°F -50 - 600°C

* Ohms cannot be measured if voltage is present. Ohms can be measured only in a non-powered circuit.

- Voltage between any terminal and ground must not exceed 500v DC or 500v peak AC.
- Use caution when measuring voltage above 25v DC or 25v AC.
- Use the low current shunt to measure circuits up to 10A. Use the high current clamp to measure circuits exceeding 10A.
- When testing for the presence of voltage or current, make sure the meter is functioning correctly. Take a reading of a known voltage or current before accepting a zero reading.
- When measuring current, connect the meter in series with test lead.
- Disconnect the live test lead before disconnecting the common test lead.
- When using the meter function, keep the DRBIII® away from spark plug or coil wires to avoid measuring error from outside interference.

4.3 WARNINGS

4.3.1 VEHICLE DAMAGE WARNINGS

Before disconnecting any control module, make sure the ignition is "off". Failure to do so could damage the module.

When testing voltage or continuity at any control module, use the terminal side (not the wire end) of the connector. Do not probe a wire through the insulation, this will damage it and eventually cause it to fail because of corrosion. Be careful when performing electrical tests so as to prevent accidental shorting of terminals. Such mistakes can damage fuses or components. Also, a second code could be set, making diagnosis of the original problem more difficult.

4.3.2 ROAD TESTING A COMPLAINT VEHICLE

Some complaints will require a test drive as part of the repair verification procedure. The purpose of the test drive is to try to duplicate the diagnostic code or symptom condition.

CAUTION: Before road testing a vehicle, be sure that all components are reassembled. During the test drive, do not try to read the DRBIII® screen while in motion. Do not hang the DRB from the rear view mirror or operate it yourself. Have an assistant available to operate the DRBIII®.

5.0 REQUIRED TOOLS AND EQUIPMENT

DRBIII® (diagnostic read-out box)
Jumper Wires
Ohmmeter
Voltmeter
Diagnostic Junction Port Tester #8339
Test Light
Miller Special Tool #8310
8310 Airbag Load Tool
8443 SRS Airbag Load Tool

6.0 GLOSSARY OF ACRONYMS

ABS	antilock brake system
ACM	airbag control module
AECM	airbag electronic control module (ACM)
APM	adjustable pedals module
ASDM	airbag system diagnostic module (ACM)
AZC	automatic zone control
BCM	body control module
CAB	controller antilock brake
DAB	driver airbag
DDM	driver door module
DLC	data link connector
DTC	diagnostic trouble code
EBL	electric back lite (rear window defogger)
ECM	engine control module
EVIC	electronic vehicle information center
HSM	heated seat module (also called seat module)
HVAC	heater ventilation, air conditioning
I/R	infrared sensor
ITM	intrusion transceiver module
MHSM	memory heated seat module (also called seat module)
MIC	mechanical instrument cluster
MSM	memory seat module
MUX	Multiplexed
ODO	odometer
ORC	occupant restraint controller (ACM)
PAB	passenger airbag
PCI	Programmable Communication Interface (vehicle communication bus)
PCM	powertrain control module
PDC	power distribution center
PDM	passenger door module
PWM	pulse width modulated
RKE	remote keyless entry
SBS	Seatbelt switch
SKIM	sentry key immobilizer module
SKIS	sentry key immobilizer system
SQUIB	also called initiator (located in rear of airbag module)
TCM	transmission control module
TPM	tire pressure monitoring
VFD	vacuum fluorescent display
VTSS	vehicle theft security system

NOTES

7.0

DIAGNOSTIC INFORMATION AND PROCEDURES

Symptom List:

ACCELEROMETER 1
ACCELEROMETER 2
INTERNAL 1
OUTPUT DRIVER 1
STORED ENERGY FIRING 1

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be INTERNAL MODULE DTC.

When Monitored and Set Condition:

ACCELEROMETER 1

When Monitored: With the ignition on, the module on board diagnostics continuously performs internal circuit tests.

Set Condition: This DTC will set if the module identifies an out of range internal circuit.

ACCELEROMETER 2

When Monitored: With the ignition on, the module on board diagnostics continuously performs internal circuit tests.

Set Condition: This DTC will set if the module identifies an out of range internal circuit.

INTERNAL 1

When Monitored: With the ignition on, the module on board diagnostics continuously performs internal circuit tests.

Set Condition: This DTC will set if the module identifies an out of range internal circuit.

OUTPUT DRIVER 1

When Monitored: With the ignition on the module on board diagnostics continuously performs internal circuit tests.

Set Condition: This DTC will set if the module identifies an out of range internal circuit.

STORED ENERGY FIRING 1

When Monitored: With the ignition on the ACM on board diagnostics continuously performs internal circuit tests.

Set Condition: This DTC will set if the ACM identifies an out of range internal circuit.

INTERNAL MODULE DTC — Continued

POSSIBLE CAUSES
AIRBAG CONTROL MODULE - ACM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Ensure the battery is fully charged. **WARNING: IF THE MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED.** **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** From the list below, select the appropriate module reporting this diagnostic trouble code. SELECT ONE: ACM - ACTIVE or STORED DTC WARNING: MAKE SURE THE BATTERY IS DISCONNECTED, THEN WAIT TWO MINUTES BEFORE PROCEEDING. Replace the Airbag Control Module in accordance with Service Instructions. Perform AIRBAG VERIFICATION TEST - VER 1. **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All

Symptom List:
AIRBAG WARNING INDICATOR OPEN
AIRBAG WARNING INDICATOR SHORT

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be AIRBAG WARNING INDICATOR TEST.

When Monitored and Set Condition:

AIRBAG WARNING INDICATOR OPEN

When Monitored: With ignition on the ACM monitors the PCI Bus for a message from the MIC containing the airbag warning indicator status. The MIC transmits the message one time at ignition on, upon lamp state change, or in response to the ACM lamp message.

Set Condition: This DTC will set if the indicator status is OPEN for 2 or 3 consecutive messages or 2 or 3 seconds.

AIRBAG WARNING INDICATOR SHORT

When Monitored: With ignition on the ACM monitors the PCI Bus for a message from the MIC containing the airbag warning indicator status. The MIC transmits the message one time at ignition on, upon lamp state change, or in response to the ACM lamp message.

Set Condition: This DTC will set if the indicator status is SHORT for 2 or 3 consecutive messages or 2 or 3 seconds.

POSSIBLE CAUSES
MIC, COMMUNICATION FAILURE
WARNING INDICATOR
ACM, WARNING INDICATOR
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Ensure the battery is fully charged. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 5 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All

AIRBAG WARNING INDICATOR TEST — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, ensure PCI Bus communications with the Instrument Cluster. Is the Instrument Cluster communicating on the PCI Bus? Yes → Go To 3 No → Refer to category COMMUNICATION CATEGORY and select the related symptom INSTRUMENT CLUSTER BUS +/- SIGNAL OPEN.	All
3	With the DRBIII® select PASSIVE RESTRAINTS, AIRBAG and MONITOR DISPLAY. Using the DRBIII®, read the WARNING LAMP MONITOR screen. Select the LAMP STATUS displayed on the DRB monitors screen. Does the DRBIII® show the LAMP STATUS: OK? YES Go To 4 NO Replace Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.	All
4	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** If there are no possible causes remaining, view repair. Repair Replace the Airbag Control Module in accordance with Service Instructions. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1.	All
5	**NOTE: Ensure the battery is fully charged.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRBIII® monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
CLUSTER MESSAGE MISMATCH

When Monitored and Set Condition:

CLUSTER MESSAGE MISMATCH

When Monitored: After the MIC bulb test is completed, the ACM compares the Lamp Request by ACM, On or Off, and the Lamp on by MIC, On or Off, PCI Bus messages. Each message is transmitted one time per second or when a change in the lamp state occur.

Set Condition: If the Lamp Request by ACM, On or Off, and the Lamp on by MIC, On or Off, messages do not match, the code will set.

POSSIBLE CAUSES
MIC DIAGNOSTIC CODES
CLUSTER MESSAGE MISMATCH
STORED CODE OR INTERMITTENT CONDITION
ACM, CLUSTER MESSAGE MISMATCH
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Ensure the battery is fully charged. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 5 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	Turn the ignition on. With the DRBIII®, read the MIC DTCs. Does the DRBIII® display any active Diagnostic Codes? Yes → Refer to symptom list for problems related to Instrument Cluster. No → Go To 3	All

CLUSTER MESSAGE MISMATCH — Continued

TEST	ACTION	APPLICABILITY
3	With the DRBIII® select PASSIVE RESTRAINTS, AIRBAG, MONITOR DISPLAY and WARNING LAMP STATUS. Cycle the ignition key and observe the LAMP ON BY MIC and LAMP REQ BY ACM monitors after the 6 to 8 second indicator test. Does the LAMP ON BY MIC and LAMP REQ BY ACM monitors match? YES Go To 4 NO Replace Mechanical Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.	All
4	**WARNING: MAKE SURE THE BATTERY IS DISCONNECTED, THEN WAIT TWO MINUTES BEFORE PROCEEDING.** If there are no possible causes remaining, view repair. Repair Replace the Airbag Control Module in accordance with Service Instructions. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1.	All
5	**NOTE: Ensure the battery is fully charged.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRBIII® monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
DRIVER CURTAIN SQUIB CIRCUIT OPEN

When Monitored and Set Condition:

DRIVER CURTAIN SQUIB CIRCUIT OPEN

When Monitored: With the ignition is On, the ACM monitors the resistance of the Curtain Squib circuits.

Set Condition: When the ACM detects an open circuit or high resistance on the Curtain Squib circuits.

POSSIBLE CAUSES
CURTAIN AIRBAG OPEN
CURTAIN SQUIB LINE 1 OR LINE 2 CIRCUIT OPEN
ACM, CURTAIN SQUIB CIRCUIT OPEN
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Ensure the battery is fully charged. Turn the ignition on. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ONE: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 4 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All

DRIVER CURTAIN SQUIB CIRCUIT OPEN — Continued

TEST	ACTION	APPLICABILITY
2	**WARNING: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: DO NOT PLACE AN INTACT UNDEPLOYED CURTAIN AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.** Disconnect the Curtain Airbag connector. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool to the Curtain Airbag connector. **WARNING: TURN IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, read the ACM active DTC's. Does the DRBIII® show CURTAIN SQUIB CIRCUIT OPEN? Yes → Go To 3 No → Replace Curtain Airbag in accordance with the Service Information. Perform AIRBAG VERIFICATION TEST - VER 1.	All
3	**WARNING: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: DO NOT PLACE AN INTACT UNDEPLOYED CURTAIN AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.** Disconnect the Airbag Load Tool Jumper. Disconnect the Airbag Control Module Connector. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool adaptor to the Airbag Control Module connector. Measure the resistance of the Curtain Squib Line 1 and Line 2 circuits between the Load Tool ACM adaptor and the Curtain Airbag connector. Is the resistance below 1.0 ohms on both circuits? Yes → Replace the Airbag Control Module in accordance with the Service information. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1. No → Repair open or high resistance in the Curtain Squib Line 1 or Line 2 circuits. Perform AIRBAG VERIFICATION TEST - VER 1.	All

DRIVER CURTAIN SQUIB CIRCUIT OPEN — Continued

TEST	ACTION	APPLICABILITY
4	**NOTE: Ensure the battery is fully charged.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Symptom:
DRIVER CURTAIN SQUIB SHORT TO BATTERY

When Monitored and Set Condition:

DRIVER CURTAIN SQUIB SHORT TO BATTERY

When Monitored: When the ignition is on, the ACM monitors the voltage of the Curtain Squib circuits.

Set Condition: When the ACM detects high voltage on the Curtain Squib circuits.

POSSIBLE CAUSES
CURTAIN AIRBAG SHORT TO BATTERY
CURTAIN SQUIB LINE 1 OR LINE 2 SHORTED TO BATTERY
ACM, CURTAIN SQUIB SHORT TO BATTERY
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Ensure the battery is fully charged. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ONE: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 4 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	**WARNING: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: DO NOT PLACE AN INTACT UNDEPLOYED CURTAIN AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.** Disconnect the Curtain Airbag connector. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool to the Curtain Airbag connector. **WARNING: TURN IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, read ACM active DTC's. Does the DRBIII® display CURTAIN SQUIB SHORT TO BATTERY? Yes → Go To 3 No → Replace Curtain Airbag in accordance with the Service Information. Perform AIRBAG VERIFICATION TEST - VER 1.	All

DRIVER CURTAIN SQUIB SHORT TO BATTERY — Continued

TEST	ACTION	APPLICABILITY
3	**WARNING: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: DO NOT PLACE AN INTACT UNDEPLOYED CURTAIN AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.** Disconnect the Airbag Load Tool Jumper. Disconnect the Airbag Control Module connector. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool ACM adaptor to the ACM connector. **WARNING: TURN IGNITION ON, THEN RECONNECT THE BATTERY.** Measure the voltage of the Curtain Squib Line 1 and Line 2 circuits between the Curtain Airbag connector and ground. Is any voltage present on either circuit? Yes → Repair Curtain Squib Line 1 or Line 2 shorted to battery. Perform AIRBAG VERIFICATION TEST - VER 1. No → Replace the Airbag Control Module in accordance with Service Instructions. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1.	All
4	**NOTE: Ensure the battery is fully charged.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRBIII® monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
DRIVER CURTAIN SQUIB SHORT TO GROUND

When Monitored and Set Condition:

DRIVER CURTAIN SQUIB SHORT TO GROUND

When Monitored: When the ignition is on, the ACM monitors the resistance of the Curtain Squib circuits.

Set Condition: When the ACM detects a short to ground on the Curtain Squib circuits.

POSSIBLE CAUSES
CURTAIN AIRBAG SHORT TO GROUND
CURTAIN SQUIB LINE 1 OR LINE 2 SHORTED TO GROUND
ACM, CURTAIN SQUIB SHORT TO GROUND
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Ensure the battery is fully charged. Turn the ignition on. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ONE: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 4 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	**WARNING: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: DO NOT PLACE AN INTACT UNDEPLOYED CURTAIN AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.** Disconnect the Curtain Airbag connector. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool to the Curtain Airbag connector. **WARNING: TURN IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, read ACM active DTC's. Does the DRBIII® display CURTAIN SQUIB SHORT TO GROUND? Yes → Go To 3 No → Replace the Curtain Airbag in accordance with Service Instructions. Perform AIRBAG VERIFICATION TEST - VER 1.	All

Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
DRIVER SEAT BELT SWITCH CIRCUIT OPEN

When Monitored and Set Condition:

DRIVER SEAT BELT SWITCH CIRCUIT OPEN

When Monitored: With the ignition on the ACM monitors the Seat Belt Switch circuit for an open condition.

Set Condition: The code will set if the ACM does not detect the correct circuit voltage.

POSSIBLE CAUSES
DRIVER SEAT BELT SWITCH OPEN
DRIVER SEAT BELT SWITCH CIRCUITS OPEN
ACM, DRIVER SEAT BELT SWITCH CIRCUIT OPEN
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that the battery is fully charged.** Turn the ignition on. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 4 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	Turn the ignition off. Disconnect the Driver Seat Belt Switch. **NOTE: Check connectors - Clean and repair as necessary.** Turn the ignition on. Measure the voltage between Driver Seat Belt Switch Line 1 and Line 2 circuits at the SBS connector. Is there any voltage present? Yes → Replace the Driver Seat Belt Switch Buckle Assembly. Perform AIRBAG VERIFICATION TEST - VER 1. No → Go To 3	All

DRIVER SEAT BELT SWITCH CIRCUIT OPEN — Continued

TEST	ACTION	APPLICABILITY
3	**WARNING: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Airbag Control Module connector **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool adaptor to the Airbag Control Module connector. Measure the resistance of the Driver SBS Line 1 and line 2 circuits between the Driver SBS harness connector and Airbag Load Tool adaptor. Is the resistance of both circuits below 10K ohms? Yes → Replace the Airbag Control Module in accordance with the Service information. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1. No → Repair the open Driver Seat Belt Switch Line 1 or Line 2. Perform AIRBAG VERIFICATION TEST - VER 1. **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
4	**NOTE: Ensure the battery is fully charged.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom List:
DRIVER SIDE IMPACT SENSOR INTERNAL 1
NO DRIVER SIDE IMPACT SENSOR COMMUNICATION

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be DRIVER SIDE IMPACT SENSOR INTERNAL 1.

When Monitored and Set Condition:

DRIVER SIDE IMPACT SENSOR INTERNAL 1

When Monitored: The Left Front Impact sensors is equipped with onboard diagnostics to monitor the sensors internal circuits. If a problem is identified the sensor sends the Driver Side Impact sensor internal 1 message to the ACM.

Set Condition: The code will set if the ACM receives an internal 1 message from the Driver Side Impact Sensor.

NO DRIVER SIDE IMPACT SENSOR COMMUNICATION

When Monitored: The ACM continuously communicates with the Driver Side Impact Sensor over the sensor signal circuit. The sensor communication and onboard diagnostics are powered by the ACM signal.

Set Condition: The code will set, if the ACM and Driver Side Impact Sensor do not establish and maintain valid data communications.

POSSIBLE CAUSES
SIGNAL CIRCUIT SHORTED TO BATTERY
SIGNAL CIRCUIT SHORT TO GROUND
DRIVER SIDE SENSOR CIRCUITS SHORTED TOGETHER
GROUND CIRCUIT OPEN
SIGNAL CIRCUIT OPEN
ACM, DRIVER SIDE IMPACT SENSOR
REPAIR IS COMPLETE
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

DRIVER SIDE IMPACT SENSOR INTERNAL 1 — Continued

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. **NOTE: Ensure the battery is fully charged.** **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 9 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Driver Side Impact Sensor connector. Disconnect the Airbag Control Module connector. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** Measure the voltage of the Driver Side Impact Sensor Signal circuit between the Driver Side Sensor connector and ground. Is there any voltage present? Yes → Repair the Driver Side Impact Sensor Signal circuit shorted to battery. Perform AIRBAG VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Measure the resistance of the Driver Side Impact Sensor Signal circuit between the Driver Side Impact Sensor connector and ground. Is the resistance below 100K ohms? Yes → Repair the Driver Side Impact Sense signal circuit shorted for a short to ground. Perform AIRBAG VERIFICATION TEST - VER 1. No → Go To 4	All
4	Measure the resistance between the Driver Side Impact Sensor Signal and Sensor Ground circuits at the Driver Side Impact Sensor connector. Is the resistance below 100K ohms? Yes → Repair the Driver Side Impact Sensor circuits shorted together. Perform AIRBAG VERIFICATION TEST - VER 1. No → Go To 5	All
5	Connect the appropriate Load Tool adaptor to the Airbag Control Module connector. Measure the resistance of the Driver Side Impact Sensor Ground circuit between the Driver Side Impact Sensor connector and the Load Tool adaptor. Is the resistance below 1 ohm? Yes → Go To 6 No → Repair the Driver Side Impact Sensor Ground circuit open or high resistance. Perform AIRBAG VERIFICATION TEST - VER 1.	All

DRIVER SIDE IMPACT SENSOR INTERNAL 1 — Continued

TEST	ACTION	APPLICABILITY
6	Connect the appropriate Load Tool adaptor to the Airbag Control Module connector. Measure the resistance of the Driver Side Impact Sensor Signal circuit between the Driver Side Impact Sensor connector and the Load Tool adaptor. Is the resistance below 1 ohm? Yes → Go To 7 No → Repair the Driver Side Impact Sensor Signal circuit open or high resistance. Perform AIRBAG VERIFICATION TEST - VER 1.	All
7	Replace the Driver Side Impact Sensor. Reconnect the vehicle body harness to the impact sensor. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** Connect the DRB to the Data Link Connector - use the most current software available. Use the DRB III and erase the stored codes in all airbag system modules. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On. Wait one minute, and read active codes and if there are none present read the stored codes. DID the active Driver Side Impact Sensor DTC return? Yes → Go To 8 No → Repair is complete. Perform AIRBAG VERIFICATION TEST - VER 1.	All
8	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED.** If there are no possible causes remaining, view repair. Repair Replace the Airbag Control Module in accordance with Service Instructions. Perform AIRBAG VERIFICATION TEST - VER 1.	All

DRIVER SIDE IMPACT SENSOR INTERNAL 1 — Continued

TEST	ACTION	APPLICABILITY
9	**NOTE: Ensure the battery is fully charged.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRBIII® monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
DRIVER SQUIB 1 CIRCUIT OPEN

When Monitored and Set Condition:

DRIVER SQUIB 1 CIRCUIT OPEN

When Monitored: With the ignition on the ACM monitors the resistance of the Driver Squib 1 circuits.

Set Condition: The ACM detects an open circuit or high resistance in the Driver Squib 1 circuits.

POSSIBLE CAUSES
DRIVER AIRBAG OPEN
CLOCKSPRING SQUIB CIRCUITS OPEN
DRIVER SQUIB 1 LINE 1 OR LINE 2 CIRCUIT OPEN
ACM, DRIVER SQUIB 1 CIRCUIT OPEN
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. **NOTE: Ensure that the battery is fully charged.** **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 5 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All

DRIVER SQUIB 1 CIRCUIT OPEN — Continued

TEST	ACTION	APPLICABILITY
2	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: DO NOT PLACE AN INTACT UNDEPLOYED AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.** Disconnect the Driver Airbag. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool to the Driver Airbag connectors. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, read the active Airbag DTCs. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
DRIVER SQUIB 1 SHORT TO BATTERY

When Monitored and Set Condition:

DRIVER SQUIB 1 SHORT TO BATTERY

When Monitored: With the ignition on the ACM monitors the voltage of the Driver Squib 1 circuits.

Set Condition: The ACM has detected high voltage on the Driver Squib 1 circuits.

POSSIBLE CAUSES
DRIVER AIRBAG CIRCUIT SHORT TO BATTERY
CLOCKSPRING, DRIVER SQUIB 1 CIRCUIT SHORT TO BATTERY
DRIVER SQUIB 1 LINE 1 OR LINE 2 SHORT TO BATTERY
ACM, DRIVER SQUIB 1 CIRCUITS SHORT TO BATTERY
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. **NOTE: Ensure that the battery is fully charged.** **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED ACM DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 5 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All

DRIVER SQUIB 1 SHORT TO BATTERY — Continued

TEST	ACTION	APPLICABILITY
2	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: DO NOT PLACE AN INTACT UNDEPLOYED AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.** Disconnect the Driver Airbag. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool to the Driver Airbag connectors. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, read the active Airbag DTCS. Does the DRBIII® show DRIVER SQUIB 1 SHORT TO BATTERY? Yes → Go To 3 No → Replace the Driver Airbag in accordance with the Service Information. Perform AIRBAG VERIFICATION TEST - VER 1.	All
3	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Clockspring connector. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool to the Clockspring connector. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, read the active Airbag DTCs. Does the DRBIII® show DRIVER SQUIB 1 SHORT TO BATTERY ? Yes → Go To 4 No → Replace the Clockspring in accordance with the Service Information. Perform AIRBAG VERIFICATION TEST - VER 1.	All
4	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED.** Disconnect the Airbag Control Module connector. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool adaptor to the Airbag Control Module connector. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** Disconnect the Load Tool from the Clockspring connector. Measure the voltage on the Driver Squib 1 Line 1 and Line 2 circuits between the Clockspring connector and ground. Is there any voltage present? Yes → Repair the Driver Squib 1 Line 1 or Line 2 circuits shorted to battery. Perform AIRBAG VERIFICATION TEST - VER 1. No → Replace the Airbag Control Module in accordance with Service Instructions. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1.	All

DRIVER SQUIB 1 SHORT TO BATTERY — Continued

TEST	ACTION	APPLICABILITY
5	**NOTE: Ensure the battery is fully charged.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRBIII® monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
DRIVER SQUIB 1 SHORT TO GROUND

When Monitored and Set Condition:

DRIVER SQUIB 1 SHORT TO GROUND

When Monitored: With the ignition on the ACM monitors the resistance of the Driver Squib 1 circuits.

Set Condition: The ACM has detected a short to ground in the Driver Squib 1 circuits.

POSSIBLE CAUSES
DRIVER AIRBAG CIRCUIT SHORT TO GROUND
CLOCKSPRING, DRIVER SQUIB 1 CIRCUIT SHORT TO GROUND
DRIVER SQUIB 1 LINE 1 OR LINE 2 SHORTED TO GROUND
ACM, DRIVER SQUIB 1 CIRCUITS SHORT TO GROUND
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. **NOTE: Ensure that the battery is fully charged.** **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 5 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All

DRIVER SQUIB 1 SHORT TO GROUND — Continued

TEST	ACTION	APPLICABILITY
2	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: DO NOT PLACE AN INTACT UNDEPLOYED AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.** Disconnect the Driver Airbag Module. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool to the Driver Airbag connectors. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, read the active Airbag DTCs. Symptom List:

LEFT FRONT IMPACT SENSOR INTERNAL 1
NO LEFT FRONT IMPACT SENSOR COMMUNICATION

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be LEFT FRONT IMPACT SENSOR TEST.

When Monitored and Set Condition:

LEFT FRONT IMPACT SENSOR INTERNAL 1

When Monitored: The Left Front Impact sensors is equipped with onboard diagnostics to monitor the sensors internal circuits. If a problem is identified the sensor sends the Left Front Impact sensor internal 1 message to the ACM.

Set Condition: The code will set if the ACM receives an internal 1 message from the Left Front Impact Sensor.

NO LEFT FRONT IMPACT SENSOR COMMUNICATION

When Monitored: The ACM continuously communicates with the Left Front Impact Sensor over the sensor signal circuit. The sensor communication and onboard diagnostics are powered by the ACM signal.

Set Condition: The code will set, if the ACM and Left Front Sensor do not establish and maintain valid data communications.

POSSIBLE CAUSES
SIGNAL CIRCUIT SHORTED TO BATTERY
SIGNAL CIRCUIT SHORT TO GROUND
LEFT SENSOR CIRCUITS SHORTED TOGETHER
GROUND CIRCUIT OPEN
SIGNAL CIRCUIT OPEN
ACM, LEFT FRONT IMPACT SENSOR
REPAIR IS COMPLETE
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

LEFT FRONT IMPACT SENSOR TEST — Continued

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. **NOTE: Ensure the battery is fully charged.** **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 9 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Left Front Impact Sensor connector. Disconnect the Airbag Control Module connector. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** Measure the voltage of the Left Front Impact Sensor Signal circuit between the Left Sensor connector and ground. Is there any voltage present? Yes → Repair the Left Front Impact Sensor Signal circuit shorted to battery. Perform AIRBAG VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Measure the resistance of the Left Impact Sensor Signal circuit between the Left Impact Sensor connector and ground. Is the resistance below 100K ohms? Yes → Repair the Left Impact Sense signal circuit shorted for a short to ground. Perform AIRBAG VERIFICATION TEST - VER 1. No → Go To 4	All
4	Measure the resistance between the Left Front Impact Sensor Signal and Sensor Ground circuits at the Left Impact Sensor connector. Is the resistance below 100K ohms? Yes → Repair the Left Front Impact Sensor circuits shorted together. Perform AIRBAG VERIFICATION TEST - VER 1. No → Go To 5	All
5	Connect the appropriate Load Tool adaptor to the Airbag Control Module connector. Measure the resistance of the Left Front Impact Sensor Ground circuit between the Left Impact Sensor connector and the Load Tool adaptor. Is the resistance below 1 ohm? Yes → Go To 6 No → Repair the Left Front Impact Sensor Ground circuit open or high resistance. Perform AIRBAG VERIFICATION TEST - VER 1.	All

LEFT FRONT IMPACT SENSOR TEST — Continued

TEST	ACTION	APPLICABILITY
6	Connect the appropriate Load Tool adaptor to the Airbag Control Module connector. Measure the resistance of the Left Front Impact Sensor Signal circuit between the Left Impact Sensor connector and the Load Tool adaptor. Is the resistance below 1 ohm? Yes → Go To 7 No → Repair the Left Front Impact Sensor Signal circuit open or high resistance. Perform AIRBAG VERIFICATION TEST - VER 1.	All
7	Replace the Left Front Impact Sensor. Reconnect the vehicle body harness to the impact sensor. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** Connect the DRB to the Data Link Connector - use the most current software available. Use the DRB III and erase the stored codes in all airbag system modules. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On. Wait one minute, and read active codes and if there are none present read the stored codes. DID the active Left Impact Sensor DTC return? Yes → Go To 8 No → Repair is complete.	All
8	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED.** If there are no possible causes remaining, view repair. Repair Replace the Airbag Control Module in accordance with Service Instructions. Perform AIRBAG VERIFICATION TEST - VER 1.	All

LEFT FRONT IMPACT SENSOR TEST — Continued

TEST	ACTION	APPLICABILITY
9	**NOTE: Ensure the battery is fully charged.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRBIII® monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
LOSS OF IGNITION RUN - START

When Monitored and Set Condition:

LOSS OF IGNITION RUN - START

When Monitored: With the ignition in the Run or Start position the module monitors the Run - Start circuit for proper system voltage.

Set Condition: The code will set, if the voltage on the Run - Start circuit drops below approximately 4.5 volts for the ACM or 6.7 volts for the SIACM.

POSSIBLE CAUSES
IGNITION SWITCH RUN-START CIRCUIT OPEN
ACM, FUSED IGNITION SW OUTPUT RUN/START SHORTED TO GROUND
FUSED IGNITION SWITCH OUTPUT RUN-START CIRCUIT OPEN
ACM, FUSED IGNITION OUTPUT RUN-START CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT RUN-START CIRCUIT SHORT TO GROUND
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. **NOTE: Ensure that the battery is fully charged.** **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** From the list below, select the appropriate module and DTC type for the this diagnostic trouble code. SELECT ONE: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 6 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	Turn ignition off. Remove and inspect the Airbag Run-Start Fuse. **NOTE: Check connectors - Clean and repair as necessary.** Is the Fuse open? Yes → Go To 3 No → Go To 4	All

LOSS OF IGNITION RUN - START — Continued

TEST	ACTION	APPLICABILITY
3	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED.** Disconnect the Airbag Control Module connector **NOTE: Check connectors - Clean and repair as necessary.** Disconnect Run - Start fuse. Connect the appropriate Load Tool adaptor to the Airbag connector. Measure the resistance of the Fused Ignition Switch Output Run-Start circuit between the Airbag Control Module adaptor and ground. Is the resistance below 10K ohms? Yes → Repair the Fused Ignition Switch Output Run-Start circuit short to ground. Perform AIRBAG VERIFICATION TEST - VER 1. No → Replace the Airbag Control Module in accordance with Service Instructions. WARNING: make sure the battery is disconnected and wait 2 minutes before proceeding. Replace the Airbag Run-Start Fuse. Perform AIRBAG VERIFICATION TEST - VER 1.	All
4	Turn the ignition on. Measure the voltage of the Ignition Switch Output circuit between the Airbag Run-Start Fuse and ground. Is the voltage above approximately 4.5 volts? Yes → Go To 5 No → Repair the open Ignition Switch Output Run-Start circuit. Perform AIRBAG VERIFICATION TEST - VER 1.	All
5	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Airbag Control Module connector. **NOTE: Check connectors - Clean and repair as necessary.** Reinstall the previously removed Airbag Run-Start Fuse. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** Measure the voltage of the Fused Ignition Switch Output Run-Start Circuit between the Airbag Control Module connector ground. Is the voltage above approximately 4.5 volts? Yes → Replace the Airbag Control Module in accordance with Service Instructions. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1. No → Repair open Fused Ignition Switch Output Run-Start circuit. Perform AIRBAG VERIFICATION TEST - VER 1.	All

LOSS OF IGNITION RUN - START — Continued

TEST	ACTION	APPLICABILITY
6	**NOTE: Ensure the battery is fully charged.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRBIII® monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
LOSS OF IGNITION RUN ONLY

When Monitored and Set Condition:

LOSS OF IGNITION RUN ONLY

When Monitored: With the ignition in the run position the module monitors the Run Only circuit for proper system voltage.

Set Condition: If the voltage on the Run Only circuit drops below 4.5 volts, the code will set.

POSSIBLE CAUSES
IGNITION SWITCH OUTPUT RUN CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT RUN CIRCUIT OPEN
ACM, FUSED IGNITION OUTPUT RUN CIRCUIT OPEN
CHECKING FOR A SHORTED RUN CIRCUIT
FUSED IGNITION SWITCH OUTPUT RUN CIRCUIT SHORT TO GROUND
ACM, FUSED IGNITION RUN CIRCUIT SHORT TO GROUND
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Ensure the battery is fully charged. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 8 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	Turn Ignition off. Remove and inspect the Airbag Run circuit fuse. Is the Fuse open? Yes → Go To 3 No → Go To 5	All

LOSS OF IGNITION RUN ONLY — Continued

TEST	ACTION	APPLICABILITY
3	Remove the Airbag Run fuse. **NOTE: Check connectors - Clean and repair as necessary.** Measure the resistance of the Fused Ignition Switch Output Run circuit between the Run Fuse and ground. Is the resistance below 10.0 ohms ? Yes → Go To 4 No → Replace the defective fuse. Perform AIRBAG VERIFICATION TEST - VER 1.	All
4	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Airbag Control Module connector. **NOTE: Check connectors - Clean and repair as necessary.** Measure the resistance of the Fused Ignition Switch Output Run circuit between the ACM connector and ground. Is the resistance below 10K ohms ? Yes → Repair the Fused Ignition Switch Output Run circuit for a short to ground and replace Airbag Run Fuse. Perform AIRBAG VERIFICATION TEST - VER 1. No → Replace the Airbag Control Module in accordance with Service Instructions and replace the Run Only Fuse. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1.	All
5	Turn ignition on. Measure the voltage of the Ignition Switch Output Run circuit between the Airbag Run circuit fuse and ground. Is the voltage above approximately 4.5 volts? Yes → Go To 6 No → Repair the open Ignition Switch Output Run circuit. Perform AIRBAG VERIFICATION TEST - VER 1.	All
6	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Airbag Control Module connector. **NOTE: Check connectors - Clean and repair as necessary.** Reinstall the airbag Run fuse. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** Measure the voltage of the Fused Ignition Switch Output Run circuit at the Airbag Control Module connector. Is the voltage above approximately 4.5 volts? Yes → Go To 7 No → Repair the an open or high resistance in the Fused Ignition Switch Output Run circuit. Perform AIRBAG VERIFICATION TEST - VER 1.	All

LOSS OF IGNITION RUN ONLY — Continued

TEST	ACTION	APPLICABILITY
7	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** If there are no possible causes remaining, view repair. Repair Replace the Airbag Control Module in accordance with Service Instructions. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1.	All
8	**NOTE: Ensure the battery is fully charged.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRBIII® monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
NO CLUSTER MESSAGE

When Monitored and Set Condition:

NO CLUSTER MESSAGE

When Monitored: With ignition on, the ACM monitors the PCI Bus for a message from the MIC containing the airbag warning indicator status. The MIC transmits the message one time at ignition on, lamp state change, or in response to the ACM message.

Set Condition: If the MIC message is not received for 10 consecutive seconds, the code will set.

POSSIBLE CAUSES
MIC, COMMUNICATION FAILURE
ACM, NO CLUSTER MESSAGES
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that the battery is fully charged.** **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** Turn the ignition on. SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 4 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	Turn the ignition on. With the DRBIII®, ensure PCI Bus communications with the Instrument Cluster. Is the Instrument Cluster communicating on the PCI Bus? Yes → Go To 3 No → Refer to category COMMUNICATION CATEGORY and select the related symptom INSTRUMENT CLUSTER BUS +/- SIGNAL OPEN.	All

NO CLUSTER MESSAGE — Continued

TEST	ACTION	APPLICABILITY
3	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** If there are no possible causes remaining, view repair. Repair Replace the Airbag Control Module in accordance with Service Instructions. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1. **NOTE: When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.**	All
4	**NOTE: Ensure the battery is fully charged.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRBIII® monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom List:

NO PASSENGER SIDE IMPACT SENSOR COMMUNICATION
PASSENGER SIDE IMPACT SENSOR INTERNAL 1

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be NO PASSENGER SIDE IMPACT SENSOR TEST.

When Monitored and Set Condition:

NO PASSENGER SIDE IMPACT SENSOR COMMUNICATION

When Monitored: The ACM continuously communicates with the Passenger Side Impact Sensor over the sensor signal circuit. The sensor communication and onboard diagnostics are powered by the ACM signal.

Set Condition: The code will set, if the ACM and Passenger Side Impact Sensor do not establish and maintain valid data communications.

PASSENGER SIDE IMPACT SENSOR INTERNAL 1

When Monitored: The Right Front Impact sensors is equipped with onboard diagnostics to monitor the sensors internal circuits. If a problem is identified the sensor sends the Passenger Side Impact sensor internal 1 message to the ACM.

Set Condition: The code will set if the ACM receives an internal 1 message from the Passenger Side Impact Sensor.

POSSIBLE CAUSES
SIGNAL CIRCUIT SHORTED TO BATTERY
SIGNAL CIRCUIT SHORT TO GROUND
PASSENGER SIDE SENSOR CIRCUITS SHORTED TOGETHER
GROUND CIRCUIT OPEN
SIGNAL CIRCUIT OPEN
ACM, PASSENGER SIDE IMPACT SENSOR
REPAIR IS COMPLETE
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

NO PASSENGER SIDE IMPACT SENSOR TEST — Continued

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. **NOTE: Ensure the battery is fully charged.** **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 9 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Passenger Side Impact Sensor connector. Disconnect the Airbag Control Module connector. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** Measure the voltage of the Passenger Side Impact Sensor Signal circuit between the Passenger Side Impact Sensor connector and ground. Is there any voltage present? Yes → Repair the Passenger Side Impact Sensor Signal circuit shorted to battery. Perform AIRBAG VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Measure the resistance of the Passenger Side Impact Sensor Signal circuit between the Passenger Side Impact Sensor connector and ground. Is the resistance below 100K ohms? Yes → Repair the Passenger Side Sense signal circuit shorted for a short to ground. Perform AIRBAG VERIFICATION TEST - VER 1. No → Go To 4	All
4	Measure the resistance between the Passenger Side Impact Sensor Signal and Sensor Ground circuits at the Passenger Side Impact Sensor connector. Is the resistance below 100K ohms? Yes → Repair the Passenger Side Impact Sensor circuits shorted together. Perform AIRBAG VERIFICATION TEST - VER 1. No → Go To 5	All
5	Connect the appropriate Load Tool adaptor to the Airbag Control Module connector. Measure the resistance of the Passenger Side Impact Sensor Ground circuit between the Passenger Side Impact Sensor connector and the Load Tool adaptor. Is the resistance below 1 ohm? Yes → Go To 6 No → Repair the Passenger Side Front Impact Sensor Ground circuit open or high resistance. Perform AIRBAG VERIFICATION TEST - VER 1.	All

NO PASSENGER SIDE IMPACT SENSOR TEST — Continued

TEST	ACTION	APPLICABILITY
6	Connect the appropriate Load Tool adaptor to the Airbag Control Module connector. Measure the resistance of the Passenger Side Impact Sensor Signal circuit between the Passenger Side Impact Sensor connector and the Load Tool adaptor. Is the resistance below 1 ohm? Yes → Go To 7 No → Repair the Passenger Side Impact Sensor Signal circuit open or high resistance. Perform AIRBAG VERIFICATION TEST - VER 1.	All
7	Replace the Passenger Side Impact Sensor. Reconnect the vehicle body harness to the impact sensor. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** Connect the DRB to the Data Link Connector - use the most current software available. Use the DRB III and erase the stored codes in all airbag system modules. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On. Wait one minute, and read active codes and if there are none present read the stored codes. DID the active Passenger Side Impact Sensor DTC return? Yes → Go To 8 No → Test Complete.	All
8	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED.** If there are no possible causes remaining, view repair. Repair Replace the Airbag Control Module in accordance with Service Instructions. Perform AIRBAG VERIFICATION TEST - VER 1.	All

NO PASSENGER SIDE IMPACT SENSOR TEST — Continued

TEST	ACTION	APPLICABILITY
9	**NOTE: Ensure the battery is fully charged.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRBIII® monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. PASSENGER CURTAIN SQUIB SHORT TO BATTERY — Continued

TEST	ACTION	APPLICABILITY
3	**WARNING: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: DO NOT PLACE AN INTACT UNDEPLOYED CURTAIN AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.** Disconnect the Airbag Load Tool Jumper. Disconnect the Airbag Control Module connector. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool ACM adaptor to the ACM connector. **WARNING: TURN IGNITION ON, THEN RECONNECT THE BATTERY.** Measure the voltage of the Curtain Squib Line 1 and Line 2 circuits between the Curtain Airbag connector and ground. Is any voltage present on either circuit? Yes → Repair Curtain Squib Line 1 or Line 2 shorted to battery. Perform AIRBAG VERIFICATION TEST - VER 1. No → Test Complete.	All
4	**NOTE: Ensure the battery is fully charged.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRBIII® monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:

PASSENGER CURTAIN SQUIB SHORT TO GROUND

When Monitored and Set Condition:

PASSENGER CURTAIN SQUIB SHORT TO GROUND

When Monitored: When the ignition is on, the ACM monitors the resistance of the Curtain Squib circuits.

Set Condition: When the ACM detects a short to ground on the Curtain Squib circuits.

POSSIBLE CAUSES
CURTAIN AIRBAG SHORT TO GROUND
CURTAIN SQUIB LINE 1 OR LINE 2 SHORTED TO GROUND
ACM, CURTAIN SQUIB SHORT TO GROUND
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Ensure the battery is fully charged. Turn the ignition on. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ONE: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 4 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	**WARNING: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: DO NOT PLACE AN INTACT UNDEPLOYED CURTAIN AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.** Disconnect the Curtain Airbag connector. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool to the Curtain Airbag connector. **WARNING: TURN IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, read ACM active DTC's. Does the DRBIII® display CURTAIN SQUIB SHORT TO GROUND? Yes → Go To 3 No → Replace the Curtain Airbag in accordance with Service Instructions. Perform AIRBAG VERIFICATION TEST - VER 1.	All

PASSENGER CURTAIN SQUIB SHORT TO GROUND — Continued

3	**WARNING: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: DO NOT PLACE AN INTACT UNDEPLOYED CURTAIN AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.** Disconnect the Airbag Load Tool Jumper. Disconnect the Airbag Control Module connector. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool ACM adaptor to the ACM connector. Measure the resistance of the Curtain Squib Line 1 and Line 2 circuits between the Curtain Squib connector and ground. Is the resistance below 10K ohms on either circuit? Yes → Repair Curtain Squib Line 1 or Line 2 shorted to ground. Perform AIRBAG VERIFICATION TEST - VER 1. No → Test Complete.	All
4	**NOTE: Ensure the battery is fully charged.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRBIII® monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
PASSENGER SEAT BELT SWITCH CIRCUIT OPEN

When Monitored and Set Condition:

PASSENGER SBS CIRCUIT OPEN

When Monitored: The ACM monitors the Seat Belt Buckle Switch circuit for an open condition.

Set Condition: The code will set if the ACM does not detect the correct circuit voltage.

POSSIBLE CAUSES
PASSENGER SBS OPEN
PASSENGER SEAT BELT SWITCH CIRCUITS OPEN
ACM, PASSENGER SEAT BELT SWITCH CIRCUIT OPEN
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Ensure the battery is fully charged. Turn the ignition on. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 4 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	Turn the ignition off. Disconnect the Passenger Seat Belt Switch. **NOTE: Check connectors - Clean and repair as necessary.** Turn the ignition on. Measure the voltage between Passenger Seat Belt Switch Line 1 and Line 2 circuits and ground. Is there voltage present on both circuits? Yes → Replace the Passenger Seat Belt Switch Buckle Assembly. Perform AIRBAG VERIFICATION TEST - VER 1. No → Go To 3	All

PASSENGER SEAT BELT SWITCH CIRCUIT OPEN — Continued

TEST	ACTION	APPLICABILITY
3	**WARNING: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Airbag Control Module connector. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool adaptor to the Airbag Control Module connectors. Measure the resistance of the Driver SBS Line 1 and line 2 circuits between the Passenger SBS harness connector and Airbag Load Tool adaptor. Is the resistance below 1.0 ohms on both circuits? Yes → Replace the Airbag Control Module in accordance with the Service information. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1. No → Repair the open Passenger Seat Belt Switch Line 1 or Line 2. Perform AIRBAG VERIFICATION TEST - VER 1.	All
4	**NOTE: Ensure the battery is fully charged.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRBIII® monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
PASSENGER SEAT BELT SWITCH SHORT TO BATTERY

When Monitored and Set Condition:

PASSENGER SEAT BELT SWITCH SHORT TO BATTERY

When Monitored: The ACM monitors the Seat Belt Buckle Switch circuit for an short to battery.

Set Condition: The code will set if the ACM detects high circuit voltage.

POSSIBLE CAUSES
PASSENGER SEAT BELT SWITCH CIRCUITS SHORTED TO BATTERY
PASSENGER SEAT BELT SWITCH SHORT TO BATTERY
ACM, PASSENGER SEAT BELT SWITCH SHORT TO BATTERY
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Ensure the battery is fully charged. Turn the ignition on. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 4 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	Turn the ignition off. **NOTE: Ensure that the battery is fully charged.** Disconnect the Passenger Seat Belt Switch connector. **NOTE: Check connectors - Clean and repair as necessary.** Turn the ignition on. With the DRBIII®, read the active Airbag DTCs. Does the DRB show PASSENGER SBS CIRCUIT OPEN? Yes → Replace the Passenger Seat Belt Switch Buckle Assembly. Perform AIRBAG VERIFICATION TEST - VER 1. No → Go To 3 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All

PASSENGER SEAT BELT SWITCH SHORT TO BATTERY — Continued

TEST	ACTION	APPLICABILITY
3	**WARNING: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Airbag Control Module connector. **NOTE: Check connectors - Clean and repair as necessary.** **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** Measure the voltage on the Passenger SBS Line 1 and Line 2 circuits at the Passenger SBS connector. Is there any voltage present? Yes → Repair the Passenger Seat Belt Switch line 1 or line 2 shorted to battery. Perform AIRBAG VERIFICATION TEST - VER 1. No → Replace the Airbag Control Module in accordance with the Service information. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Symptom:
PASSENGER SEAT BELT SWITCH SHORT TO GROUND

When Monitored and Set Condition:

PASSENGER SEAT BELT SWITCH SHORT TO GROUND

When Monitored: The ACM monitors the Seat Belt Buckle Switch circuit for a shorted together or shorted to ground condition.

Set Condition: The code will set if the ACM detects low circuit voltage.

POSSIBLE CAUSES
PASSENGER SEAT BELT SWITCH SHORT TOGETHER OR TO GROUND
PASSENGER SEAT BELT SWITCH CIRCUITS SHORTED TOGETHER
PASSENGER SEAT BELT SWITCH CIRCUITS SHORTED TO GROUND
ACM, PASSENGER SEAT BELT SWITCH SHORT TO GROUND
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	Ensure the battery is fully charged. Turn the ignition on. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 5 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	Turn Ignition off. Disconnect the Passenger Seat Belt Switch connector. **NOTE: Check connectors - Clean and repair as necessary.** Turn Ignition on. With the DRBIII®, read the active Airbag DTCs. Does the DRB show PASSENGER SBS CIRCUIT OPEN? Yes → Replace the Passenger Seat Belt Switch Buckle Assembly. Perform AIRBAG VERIFICATION TEST - VER 1. No → Go To 3	All

PASSENGER SEAT BELT SWITCH SHORT TO GROUND — Continued

TEST	ACTION	APPLICABILITY
3	**WARNING: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Airbag Control Module connector **NOTE: Check connectors - Clean and repair as necessary.** Measure the resistance between the Driver SBS Line 1 and line 2 circuit at the Passenger SBS connector. Is the resistance below 10K ohms? Yes → Repair the Passenger Seat Belt Switch Line 1 and Line 2 shorted together. Perform AIRBAG VERIFICATION TEST - VER 1. No → Go To 4	All
4	**WARNING: TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Airbag Control Module connector **NOTE: Check connectors - Clean and repair as necessary.** Measure the resistance of the Passenger SBS Line 1 and line 2 circuit between the Passenger SBS connector and ground. Is the resistance below 10K ohms on either circuit? Yes → Repair the Passenger Seat Belt Switch line 1 or line 2 shorted to ground. Perform AIRBAG VERIFICATION TEST - VER 1. No → Replace the Airbag Control Module in accordance with the Service information. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1.	All
5	**NOTE: Ensure the battery is fully charged.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRBIII® monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. 2	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: DO NOT PLACE AN INTACT UNDEPLOYED AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.** Disconnect the Passenger Airbag connector. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool to the Passenger Airbag connector. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, read the active Airbag DTCs. Does the DRB show PASSENGER SQUIB 2 CIRCUIT OPEN? Yes → Go To 3 No → Replace Passenger Airbag in accordance with the Service Information. Perform AIRBAG VERIFICATION TEST - VER 1.	All
3	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Airbag Control Module connector. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool adaptor to the Airbag Control Module connector. Disconnect the Load Tool from the Passenger Airbag connector. Measure the resistance of the Passenger Squib 2 Line 1 and Line 2 circuits between the ACM adaptor and the Passenger Airbag connector. Is the resistance below 1.0 ohms on both circuits? Yes → Replace the Airbag Control Module in accordance with Service Instructions. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1. No → Repair open or high resistance in Passenger Squib 2 Line 1 or Line 2 circuits. Perform AIRBAG VERIFICATION TEST - VER 1.	All

PASSENGER SQUIB 2 CIRCUIT OPEN — Continued

TEST	ACTION	APPLICABILITY
4	**NOTE: Ensure the battery is fully charged.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRBIII® monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem: - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
PASSENGER SQUIB 2 CIRCUIT SHORT

When Monitored and Set Condition:

PASSENGER SQUIB 2 CIRCUIT SHORT

When Monitored: When the ignition is on, the ACM monitors the resistance of the Passenger Squib 2 circuits.

Set Condition: The ACM has detected low resistance in the Passenger Squib 2 circuits.

POSSIBLE CAUSES
PASSENGER AIRBAG CIRCUIT SHORT
PASSENGER SQUIB 1 LINE 1 SHORT TO LINE 2
STORED CODE OR INTERMITTENT CONDITION
ACM, PASSENGER SQUIB 2 CIRCUIT SHORT
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that the battery is fully charged.** Turn the ignition on. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 4 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: DO NOT PLACE AN INTACT UNDEPLOYED AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.** Disconnect the Passenger Airbag. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool to the Passenger Airbag connector. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, read the active DTCs. Does the DRB show PASSENGER SQUIB 2 CIRCUIT SHORT? Yes → Go To 3 No → Replace Passenger Airbag in accordance with the Service Information. Perform AIRBAG VERIFICATION TEST - VER 1.	All

PASSENGER SQUIB 2 CIRCUIT SHORT — Continued

TEST	ACTION	APPLICABILITY
3	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Airbag Control Module connector **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool adaptor to the Airbag Control Module connectors. Disconnect the Load Tool from the Passenger Airbag connector. Measure the resistance between the Passenger Squib 2 Line 1 and line 2 circuits at the Passenger Airbag connector. Is the resistance below 10K ohms? Yes → Repair Passenger Squib 2 Line 1 circuit short to Passenger Squib 2 Line 2 circuit. Perform AIRBAG VERIFICATION TEST - VER 1. No → Replace the Airbag Control Module in accordance with Service Instructions. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1.	All
4	**NOTE: Ensure the battery is fully charged.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
PASSENGER SQUIB 2 SHORT TO BATTERY

When Monitored and Set Condition:

PASSENGER SQUIB 2 SHORT TO BATTERY

When Monitored: When the ignition is on, the ACM monitors the voltage of the Passenger Squib 2 circuits.

Set Condition: The ACM has detected high voltage on the Passenger Squib 2 circuits.

POSSIBLE CAUSES
PASSENGER AIRBAG CIRCUIT SHORT TO BATTERY
PASSENGER SQUIB 2 LINE 1 OR LINE 2 SHORTED TO BATTERY
ACM, PASSENGER SQUIB 2 CIRCUIT SHORT TO BATTERY
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that the battery is fully charged.** Turn the ignition on. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 4 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: DO NOT PLACE AN INTACT UNDEPLOYED AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.** Disconnect the Passenger Airbag connector. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool to the Passenger Airbag connector. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, read the active Airbag DTCs. Does the DRB show PASSENGER SQUIB 2 CIRCUIT SHORT TO BATTERY? Yes → Go To 3 No → Replace Passenger Airbag in accordance with the Service Information. Perform AIRBAG VERIFICATION TEST - VER 1.	All

PASSENGER SQUIB 2 SHORT TO BATTERY — Continued

TEST	ACTION	APPLICABILITY
3	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Airbag Control Module connector. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool adaptor to the Airbag Control Module connector. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** Disconnect the Load Tool from the Passenger Airbag connector. Measure the voltage on the Passenger Squib 2 Line 1 and Line 2 circuits between the Passenger Airbag connector and ground. Is there any voltage present? Yes → Repair Passenger Squib 2 Line 1 or Line 2 circuit shorted to battery. Perform AIRBAG VERIFICATION TEST - VER 1. No → Replace the Airbag Control Module in accordance with Service Instructions. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1.	All
4	**NOTE: Ensure the battery is fully charged.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRBIII® monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
PASSENGER SQUIB 2 SHORT TO GROUND

When Monitored and Set Condition:

PASSENGER SQUIB 2 SHORT TO GROUND

When Monitored: When the ignition is on, the ACM monitors the resistance of the Passenger Squib 2 circuits for low resistance.

Set Condition: The ACM has detected a short to ground in the Passenger Squib 2 circuits.

POSSIBLE CAUSES
PASSENGER AIRBAG CIRCUIT SHORTED TO GROUND
PASSENGER SQUIB 2 LINE 1 OR LINE 2 SHORT TO GROUND
ACM, PASSENGER SQUIB 2 CIRCUIT SHORT TO GROUND
STORED CODE OR INTERMITTENT CONDITION
ACTIVE CODE PRESENT

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that the battery is fully charged.** Turn the ignition on. **NOTE: For the purpose of this test, the AECM and ORC modules will be referred to as an ACM.** SELECT ACTIVE or STORED DTC: ACM - ACTIVE DTC Go To 2 ACM - STORED DTC Go To 4 **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: DO NOT PLACE AN INTACT UNDEPLOYED AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.** Disconnect the Passenger Airbag connector. **NOTE: Check connectors - Clean and repair as necessary.** Connect the appropriate Load Tool to the Passenger Airbag connector. **WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** With the DRBIII®, read the active Airbag DTCs. Does the DRB show PASSENGER SQUIB 2 CIRCUIT SHORT TO GROUND? Yes → Go To 3 No → Replace the Passenger Airbag in accordance with the Service Information. Perform AIRBAG VERIFICATION TEST - VER 1.	All

PASSENGER SQUIB 2 SHORT TO GROUND — Continued

TEST	ACTION	APPLICABILITY
3	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** **WARNING: DO NOT PLACE AN INTACT UNDEPLOYED AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.** Disconnect the Airbag Control Module connector **NOTE: Check connectors - Clean repair as necessary.** Connect the appropriate Load Tool adaptor to the Airbag Control Module connector. Disconnect the Load Tool from the Passenger Airbag connector. Measure the resistance of the Passenger Squib 2 Line 1 and Line 2 circuits between the Passenger Airbag Module connector and ground. Is the resistance below 10K ohms on either circuit? Yes → Repair Passenger Squib 2 Line 1 or Line 2 circuit for a shorted to ground. Perform AIRBAG VERIFICATION TEST - VER 1. No → Replace the Airbag Control Module in accordance with Service Instructions. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1.	All
4	**NOTE: Ensure the battery is fully charged.** With the DRBIII®, record and erase all DTCs from all modules. All active codes must be resolved before diagnosing any stored codes. Maintain a safe distance from all airbags while performing the following steps. With the DRBIII® monitor active codes as you work through the system. **NOTE: If equipped with Passenger Airbag On-Off switch, read the DTC's in all switch positions.** Wiggle the wiring harness and connectors of the appropriate airbag system and rotate the steering wheel from stop to stop. **NOTE: Check connectors - Clean and repair as necessary.** You have just attempted to simulate the condition that initially set the trouble code message. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. Did the DTC become active ? Yes → Select appropriate symptom from Symptom List. No → No problem found at this time. Erase all codes before returning vehicle to customer.	All

Symptom:
*AIRBAG INDICATOR ON WITHOUT ACTIVE TROUBLE CODES

POSSIBLE CAUSES
FRONT OR SIDE IMPACT SENSOR STORED TROUBLE CODE
ACM, IMPACT SENSOR INTERNAL 1 STORED TROUBLE CODE
INSTRUMENT CLUSTER PROBLEMS

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Make sure that all Airbag and Instrument Cluster active DTCs have been repaired before performing this procedure. With the DRBIII® select MONITOR DISPLAY, WARNING LAMP STATUS and read the PASSIVE RESTRAINTS, AIRBAG, MONITOR DISPLAY, WARNING LAMP STATES. With no active DTCs, Does the LAMP REQ by ACM monitor show ON? Yes → Go To 2 No → Repair or replace the Instrument Cluster as necessary. Perform BODY VERIFICATION TEST - VER 1. **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	With the DRBIII®, read the stored DTCs. Does the DRB show a stored FRONT or SIDE IMPACT SENSOR INTERNAL 1 trouble code? Yes → WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING. Replace the front or side impact sensor indicated by the stored diagnostic trouble code. Perform AIRBAG VERIFICATION TEST - VER 1. No → Replace the Airbag Control Module in accordance with Service Instructions. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. Perform AIRBAG VERIFICATION TEST - VER 1.	All

Symptom:
ALL OUTPUTS SHORT - BASE AUDIO SYSTEM

When Monitored and Set Condition:

ALL OUTPUTS SHORT - BASE AUDIO SYSTEM

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: The radio has sensed a short on the output for more than 10 seconds.

POSSIBLE CAUSES
DETERMINE FAULT
FRONT SHORTED SPEAKER
REAR SHORTED SPEAKER
(+) CIRCUIT SHORTED TO GROUND
(-) CIRCUIT SHORTED TO GROUND
SPEAKER (+) & (-) CIRCUITS SHORTED TOGETHER
SPEAKER SECTION OF RADIO

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Turn the Radio on. With the DRBIII®, erase the audio DTC's. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read the audio DTC's. Does the DRBIII® display ALL OUTPUTS SHORT? Yes → Go To 2 No → Refer to the wiring diagrams located in the service information to help isolate a possible intermittent short. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. **NOTE: Perform this procedure after disconnecting each front speaker and each I/P speaker (if equipped) connector.** Disconnect each front speaker and each I/P speaker (if equipped) harness connector one at a time. Turn the ignition on. Turn the radio on. With the DRBIII®, erase the audio DTCs. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read DTC's. Does the DRBIII® display ALL OUTPUTS SHORT with all the speakers disconnected? Yes → Go To 3 No → Replace the Speaker that when disconnected the DTC did not reset. Perform BODY VERIFICATION TEST - VER 1.	All

ALL OUTPUTS SHORT - BASE AUDIO SYSTEM — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. **NOTE: Perform this procedure after disconnecting each rear speaker connector.** Disconnect each rear speaker harness connector one at a time. Turn the ignition on. Turn the radio on. With the DRBIII®, erase the audio DTCs. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read DTC's. Does the DRBIII® display ALL OUTPUTS SHORT with all the rear speakers disconnected? Yes → Go To 4 No → Replace the Speaker that when disconnected the DTC did not reset. Perform BODY VERIFICATION TEST - VER 1.	All
4	Turn the ignition off. Disconnect each front and rear speaker harness connectors. Disconnect the Radio harness connector. Measure the resistance between ground and each speaker (+) circuit. Is the resistance below 1000.0 (1K) ohms? Yes → Repair the speaker (+) circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Disconnect each front and rear speaker harness connectors. Disconnect the Radio harness connector. Measure the resistance between ground and each speaker (-) circuit. Is the resistance below 1000.0 (1K) ohms? Yes → Repair the speaker (-) circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	Turn the ignition off. Disconnect each front and rear speaker harness connectors. Disconnect the Radio harness connector. Measure the resistance between each speaker (+) circuit and each speaker (-) circuit. Is the resistance below 1000.0 (1K) ohms for any of the measurements? Yes → Repair the speaker circuits shorted together. Perform BODY VERIFICATION TEST - VER 1. No → Go To 7	All
7	If there are no possible causes remaining, view repair. Repair Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
ALL OUTPUTS SHORT - PREMIUM AUDIO SYSTEM

When Monitored and Set Condition:

ALL OUTPUTS SHORT - PREMIUM AUDIO SYSTEM

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: The radio has sensed a short on the output for more than 10 seconds.

POSSIBLE CAUSES
DETERMINE FAULT
SPEAKER SECTION OF POWER AMPLIFIER
(+) CIRCUIT SHORTED TO GROUND
(-) CIRCUIT SHORTED TO GROUND
SPEAKER (+) & (-) CIRCUITS SHORTED TOGETHER
SPEAKER SECTION OF RADIO

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Turn the Radio on. With the DRBIII®, erase the audio DTC's. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read the audio DTC's. Does the DRBIII® display ALL OUTPUTS SHORT? Yes → Go To 2 No → Refer to the wiring diagrams located in the service information to help isolate a possible short. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Power Amplifier harness connectors. Turn the ignition on. Turn the radio on. With the DRBIII®, erase the audio DTCs. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read DTC's. Does the DRBIII® display ALL OUTPUTS SHORT? Yes → Go To 3 No → Replace the Power Amplifier in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.	All

ALL OUTPUTS SHORT - PREMIUM AUDIO SYSTEM — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Power Amplifier harness connectors. Disconnect the Radio harness connector. Measure the resistance between ground and any speaker (+) circuit. Is the resistance below 1000.0 (1K) ohms? Yes → Repair the speaker (+) circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Disconnect the Power Amplifier harness connectors. Disconnect the Radio harness connector. Measure the resistance between ground and any speaker (-) circuit. Is the resistance below 1000.0 (1K) ohms? Yes → Repair the speaker (-) circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Disconnect the Power Amplifier harness connectors. Disconnect the Radio harness connector. Measure the resistance between each speaker (+) circuit and each speaker (-) circuit. Is the resistance below 1000.0 (1K) ohms for any of the measurements? Yes → Repair the speaker circuits shorted together. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	If there are no possible causes remaining, view repair. Repair Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom List:

CASSETTE PLAYER INOP
CD MECHANICAL FAILURE
***AM/FM SWITCH INOPERATIVE**
***ANY STATION PRESET SWITCH INOPERATIVE**
***BALANCE INOPERATIVE**
***CD EJECT SWITCH INOPERATIVE**
***EQUALIZER INOPERATIVE**
***FADER INOPERATIVE**
***FF/RW SWITCH INOPERATIVE**
***HOUR/MINUTE SWITCHES INOPERATIVE**
***PAUSE/PLAY SWITCH INOPERATIVE**
***PWR SWITCH INOPERATIVE**
***SCAN SWITCH INOPERATIVE**
***SEEK SWITCH INOPERATIVE**
***SET SWITCH INOPERATIVE**
***TAPE EJECT SWITCH INOPERATIVE**
***TIME SWITCH INOPERATIVE**
***TUNE SWITCH INOPERATIVE**

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be CASSETTE PLAYER INOP.

When Monitored and Set Condition:

CASSETTE PLAYER INOP

When Monitored: Continuously with the ignition and radio turned on.

Set Condition: The code will set if the radio detects a internal cassette failure.

CD MECHANICAL FAILURE

When Monitored: Continuously with the ignition and CD player turned on.

Set Condition: The code will set if the radio detects a CD mechanical failure.

CASSETTE PLAYER INOP — Continued

POSSIBLE CAUSES
INTERNAL FAILURE

TEST	ACTION	APPLICABILITY
1	**NOTE: If a DTC is set, erase the DTC and attempt to reset the DTC. If DTC resets, follow this test.** This is an internal radio failure. View repair Repair Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
CD CHANGER MECHANICAL FAILURE

When Monitored and Set Condition:

CD CHANGER MECHANICAL FAILURE

When Monitored: Continuously with the ignition and CD Changer turned on.

Set Condition: The code will set if the CD Changer detects a mechanical failure.

POSSIBLE CAUSES
INTERNAL FAILURE

TEST	ACTION	APPLICABILITY
1	**NOTE: Erase DTC and attempt to reset. If DTC resets, follow this test.** This is an internal CD Changer failure. View repair Repair Replace the CD Changer. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
CD CHANGER READ FAILURE

When Monitored and Set Condition:

CD CHANGER READ FAILURE

When Monitored: Continuously with the ignition and CD Changer turned on.

Set Condition: The code will set if a CD that is not formatted as a music CD is installed in the CD Changer.

POSSIBLE CAUSES
CD CHANGER READ FAILURE

TEST	ACTION	APPLICABILITY
1	Replace the problem CD with a good, clean, unscratched, music CD. Turn the radio on and select the good CD. With the DRBIII®, read DTC's. Does the DRBIII® display CD CHANGER READ FAILURE? Yes → Replace the CD Changer. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
CD CHANGER TEMPERATURE HIGH

When Monitored and Set Condition:

CD CHANGER TEMPERATURE HIGH

When Monitored: Continuously with the ignition and CD Changer turned on.

Set Condition: The code will set if the temperature inside the CD Changer is above +65° C (+145° F).

POSSIBLE CAUSES
HIGH TEMPERATURE FAILURE

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase the audio DTC's. Start the engine and allow the engine to reach normal operating temperature. If the vehicle has been in the hot sunlight or extreme cold move the vehicle indoors and open the doors to allow the inside temperature to stabilize. The CD Changer will operate between -23° C and 65° C (-10° F and +145° F). With the DRBIII®, read DTC's. Does the DRBIII® display CD CHANGER TEMPERATURE HIGH? Yes → Replace the CD Changer. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
CD READ FAILURE

When Monitored and Set Condition:

CD READ FAILURE

When Monitored: Continuously with the ignition and the radio CD player turned on.

Set Condition: The code will set if a CD that is not formatted as a music CD is installed in the radio CD player.

POSSIBLE CAUSES
CD READ FAILURE

TEST	ACTION	APPLICABILITY
1	Replace the problem CD with a good, clean, unscratched, music CD. Turn the radio CD player on. With the DRBIII®, read DTC's. Does the DRBIII® display CD READ FAILURE? Yes → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
CD TEMPERATURE HIGH

When Monitored and Set Condition:

CD TEMPERATURE HIGH

When Monitored: Continuously with the ignition and the radio CD player turned on.

Set Condition: The code will set if the temperature inside the radio CD player is above +70° C (+156° F).

POSSIBLE CAUSES
HIGH TEMPERATURE FAILURE

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase the audio DTC's. Start the engine and allow the engine to reach normal operating temperature. If the vehicle has been in the hot sunlight or extreme cold move the vehicle indoors and open the doors to allow the inside temperature to stabilize. The radio CD player will operate between -23° C and 70° C (-10° F and +156° F). With the DRBIII®, read DTC's. Does the DRBIII® display CD TEMPERATURE HIGH? Yes → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
NO ANTENNA CONNECTION

When Monitored and Set Condition:

NO ANTENNA CONNECTION

When Monitored: With the ignition on and the radio in seek up/down mode.

Set Condition: With the radio in seek or scan mode for two minutes and the radio does not detect an antenna connection or does not receive a radio station signal.

POSSIBLE CAUSES
BAD ANTENNA CONNECTION
TEST ANTENNA
RADIO

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the Radio Antenna connector. Inspect the Radio Antenna connection. Was the Antenna connection clean and tight? Yes → Go To 2 No → Repair Antenna connection as needed. Perform BODY VERIFICATION TEST - VER 1.	All
2	Refer to the Audio System in the service information and test the Antenna in accordance with the service procedure. Is the Antenna ok? Yes → Go To 3 No → Repair or replace the Antenna assembly as necessary. Perform BODY VERIFICATION TEST - VER 1.	All
3	**Note: Reconnect all previously disconnected components.** Turn the ignition and Radio on. With the DRBIII®, erase the audio DTC's, put the radio in seek up and seek down mode for approximately 2 minutes before proceeding. With the DRBIII®, read the audio DTC's. Did this DTC reset? Yes → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
POWER AMP SHUTDOWN - BASE AUDIO SYSTEM

When Monitored and Set Condition:

POWER AMP SHUTDOWN - BASE AUDIO SYSTEM

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: The radio has sensed a short on the output for more than 10 seconds.

POSSIBLE CAUSES
DETERMINE FAULT
FRONT SHORTED SPEAKER
REAR SHORTED SPEAKER
(+) CIRCUIT SHORTED TO GROUND
(-) CIRCUIT SHORTED TO GROUND
SPEAKER (+) & (-) CIRCUITS SHORTED TOGETHER
SPEAKER SECTION OF RADIO

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Turn the Radio on. With the DRBIII®, erase the audio DTC's. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read the audio DTC's. Does the DRBIII® display POWER AMP SHUTDOWN? Yes → Go To 2 No → Refer to the wiring diagrams located in the service information to help isolate a possible intermittent short. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. **NOTE: Perform this procedure after disconnecting each front speaker and each I/P speaker (if equipped) connector.** Disconnect each front speaker and each I/P speaker (if equipped) harness connector one at a time. Turn the ignition on. Turn the radio on. With the DRBIII®, erase the audio DTCs. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read DTC's. Does the DRBIII® display POWER AMP SHUTDOWN with all the speakers disconnected? Yes → Go To 3 No → Replace the Speaker that when disconnected the DTC did not reset. Perform BODY VERIFICATION TEST - VER 1.	All

POWER AMP SHUTDOWN - BASE AUDIO SYSTEM — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. **NOTE: Perform this procedure after disconnecting each rear speaker connector.** Disconnect each rear speaker harness connector one at a time. Turn the ignition on. Turn the radio on. With the DRBIII®, erase the audio DTCs. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read DTC's. Does the DRBIII® display POWER AMP SHUTDOWN with all the rear speakers disconnected? Yes → Go To 4 No → Replace the Speaker that when disconnected the DTC did not reset. Perform BODY VERIFICATION TEST - VER 1.	All
4	Turn the ignition off. Disconnect each front and rear speaker harness connectors. Disconnect the Radio harness connector. Measure the resistance between ground and each speaker (+) circuit. Is the resistance below 1000.0 (1K) ohms? Yes → Repair the speaker (+) circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Disconnect each front and rear speaker harness connectors. Disconnect the Radio harness connector. Measure the resistance between ground and each speaker (-) circuit. Is the resistance below 1000.0 (1K) ohms? Yes → Repair the speaker (-) circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	Turn the ignition off. Disconnect each front and rear speaker harness connectors. Disconnect the Radio harness connector. Measure the resistance between each speaker (+) circuit and each speaker (-) circuit. Is the resistance below 1000.0 (1K) ohms for any of the measurements? Yes → Repair the speaker circuits shorted together. Perform BODY VERIFICATION TEST - VER 1. No → Go To 7	All
7	If there are no possible causes remaining, view repair. Repair Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
POWER AMP SHUTDOWN - PREMIUM AUDIO SYSTEM

When Monitored and Set Condition:

POWER AMP SHUTDOWN - PREMIUM AUDIO SYSTEM

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: The radio has sensed a short on the output for more than 10 seconds.

POSSIBLE CAUSES
DETERMINE FAULT
SPEAKER SECTION OF POWER AMPLIFIER
(+) CIRCUIT SHORTED TO GROUND
(-) CIRCUIT SHORTED TO GROUND
SPEAKER (+) & (-) CIRCUITS SHORTED TOGETHER
SPEAKER SECTION OF RADIO

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Turn the Radio on. With the DRBIII®, erase the audio DTC's. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read the audio DTC's. Does the DRBIII® display POWER AMP SHUTDOWN? Yes → Go To 2 No → Refer to the wiring diagrams located in the service information to help isolate a possible short. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Power Amplifier harness connectors. Turn the ignition on. Turn the radio on. With the DRBIII®, erase the audio DTCs. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read DTC's. Does the DRBIII® display POWER AMP SHUTDOWN? Yes → Go To 3 No → Replace the Power Amplifier in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.	All

POWER AMP SHUTDOWN - PREMIUM AUDIO SYSTEM — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Power Amplifier harness connectors. Disconnect the Radio harness connector. Measure the resistance between ground and any speaker (+) circuit. Is the resistance below 1000.0 (1K) ohms? Yes → Repair the speaker (+) circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Disconnect the Power Amplifier harness connectors. Disconnect the Radio harness connector. Measure the resistance between ground and any speaker (-) circuit. Is the resistance below 1000.0 (1K) ohms? Yes → Repair the speaker (-) circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Disconnect the Power Amplifier harness connectors. Disconnect the Radio harness connector. Measure the resistance between each speaker (+) circuit and each speaker (-) circuit. Is the resistance below 1000.0 (1K) ohms for any of the measurements? Yes → Repair the speaker circuits shorted together. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	If there are no possible causes remaining, view repair. Repair Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
RADIO DIMMING SHORTED HIGH

When Monitored and Set Condition:

RADIO DIMMING SHORTED HIGH

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: The BCM is trying to activate the radio dimming output (park lamps on and parade mode requested). The code will set if the BCM pulls this input low and excessive current is sinked into the BCM.

POSSIBLE CAUSES
DIMMER SECTION OF RADIO
PANEL LAMPS DRIVER CIRCUIT SHORTED TO VOLTAGE
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the Radio harness connector. Turn the ignition on. Turn the park lamps on. Measure the voltage of the Panel Lamps Driver circuit at the Radio connector. Rotate the dimmer switch from full low intensity to full high intensity. Does the voltage increase from approximately 3.5 volts to approximately 12.0 volts? Yes → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the Radio harness connector. Disconnect the BCM C1 harness connector. Turn the ignition on. Measure the voltage of the Panel Lamps Driver circuit at the Radio connector. Is the voltage above 1.0 volt? Yes → Repair the Panel Lamps Driver circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
REMOTE RADIO SWITCH SHORTED TO GROUND

When Monitored and Set Condition:

REMOTE RADIO SWITCH SHORTED TO GROUND

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: The code will set if the BCM detects a short to ground on the Radio Control MUX circuit for more than 5 seconds.

POSSIBLE CAUSES
LEFT REMOTE RADIO SWITCH SHORTED TO GROUND
RIGHT REMOTE RADIO SWITCH SHORTED TO GROUND
RADIO CONTROL MUX CIRCUIT SHORTED TO GROUND AT THE SWITCH
RADIO CONTROL MUX CIRCUIT SHORTED TO THE RETURN CIRCUIT AT THE SWITCH
CLOCKSPRING SHORTED TO GROUND
RADIO CONTROL MUX CIRCUIT SHORTED TO GROUND
RADIO CONTROL MUX CKT SHORTED TO THE RADIO CONTROL MUX RETURN CKT
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	**WARNING: Turn the ignition off, disconnect the battery and wait 2 minutes before proceeding.** **CAUTION: Do not place an intact undeployed airbag module face down on a hard surface, the airbag module will propel into the air if accidently deployed.** Remove the Driver Airbag Module. Disconnect the Left Remote Radio Switch harness connector. Turn the ignition on, reconnect the battery. With the DRB, enter Body Computer then Sensors and monitor the Radio Control SW voltage Is the voltage approximately 5.0 volts? Yes → Replace the Left Remote Radio Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All

REMOTE RADIO SWITCH SHORTED TO GROUND — Continued

TEST	ACTION	APPLICABILITY
2	**WARNING: Turn the ignition off, disconnect the battery and wait 2 minutes before proceeding.** **CAUTION: Do not place an intact undeployed airbag module face down on a hard surface, the airbag module will propel into the air if accidently deployed.** Remove the Driver Airbag Module. Disconnect the Right Remote Radio Switch harness connector. Turn the ignition on, reconnect the battery. With the DRB, enter Body Computer then Sensors and monitor the Radio Control SW voltage Is the voltage approximately 5.0 volts? Yes → Replace the Right Remote Radio Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the Clockspring C4 harness connector. Turn the ignition on. With the DRB, enter Body Computer then Sensors and monitor the Radio Control SW voltage. Is the voltage approximately 5.0 volts? Yes → Go To 4 No → Go To 5	All
4	Turn the ignition off. Disconnect the Clockspring C4 harness connector. **NOTE: Ensure both remote radio switches are disconnected.** Measure the resistance between ground and the Radio Control MUX circuit at the clockspring C4 harness connector. Is the resistance below 5.0 ohms? Yes → Repair the Radio Control MUX circuit for a short to ground between the clockspring and the remote radio switches. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Radio Control MUX circuit for a short to the Radio Control MUX Return circuit between the clockspring and the remote radio switches. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Disconnect the Clockspring C3 harness connector. Turn the ignition on. With the DRB, enter Body Computer then Sensors and monitor the Radio Control SW voltage. Is the voltage approximately 5.0 volts? Yes → Replace the Clockspring. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All

REMOTE RADIO SWITCH SHORTED TO GROUND — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off. Disconnect the Clockspring C3 harness connector. Disconnect the BCM C2 harness connector. Measure the resistance between ground and the Radio Control MUX circuit. Is the resistance below 5.0 ohms? Yes → Repair the Radio Control MUX circuit for a short to ground between the clockspring and the BCM. Perform BODY VERIFICATION TEST - VER 1. No → Go To 7	All
7	Turn the ignition off. Disconnect the Clockspring C3 harness connector. Disconnect the BCM C2 harness connector. Measure the resistance between the Radio Control MUX circuit and the Radio Control MUX Return circuit. Is the resistance below 5.0 ohms? Yes → Repair the Radio Control MUX circuit for a short to the Radio Control MUX Return circuit between the clockspring and the BCM. Perform BODY VERIFICATION TEST - VER 1. No → Go To 8	All
8	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*NO SOUND FROM ALL SPEAKERS

POSSIBLE CAUSES
INTERMITTENT SHORT - FUSE #5
POWER AMPLIFIER - INTERNAL SHORT
RADIO - FUSED B+ CKT SHORTED
FUSED B+ CIRCUIT SHORTED TO GROUND
INTERMITTENT SHORT - FUSE #30
RADIO - FUSED IGNITION SWITCH CKT SHORTED
FUSED IGNITION SWITCH OUTPUT CIRCUIT SHORTED TO GROUND
OPEN FUSED B+ CIRCUIT TO RADIO
OPEN FUSED IGNITION SWITCH OUTPUT CKT TO RADIO
OPEN RADIO GROUND CIRCUIT
OPEN FUSED B+ CIRCUIT TO POWER AMPLIFIER
OPEN GROUND CIRCUIT TO POWER AMPLIFIER
OPEN ENABLE SIGNAL TO AMPLIFIER CIRCUIT
ENABLE SIGNAL TO AMPLIFIER CIRCUIT SHORTED TO GROUND
RADIO (NO SPEAKER OUTPUT)
RADIO (NO ENABLE SIGNAL TO AMPILIFER)
POWER AMPLIFIER (NO OUTPUT)

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Remove and inspect fuse #5 in the Junction Block. Is the fuse open? Yes → Go To 2 No → Go To 5	All
2	Replace fuse #5 in the Junction Block. Turn the radio on. Remove and inspect fuse #5 in the Junction Block. Is the fuse open? Yes → Go To 3 No → Replace fuse #5 in the Junction Block. Refer to the wiring diagrams located in the service information to help isolate a possible intermittent short to ground condition. Perform BODY VERIFICATION TEST - VER 1.	All

*NO SOUND FROM ALL SPEAKERS — Continued

TEST	ACTION	APPLICABILITY
3	**NOTE: If vehicle is not equipped with a power amplifier, answer yes to the question.** Turn the ignition off. Disconnect the Power Amplifier harness connector. Replace fuse #5 in the Junction Block. Turn the radio on. Remove and inspect fuse #5 in the Junction Block. Is the fuse open? Yes → Go To 4 No → Replace the Power Amplifier. Perform BODY VERIFICATION TEST - VER 1.	All
4	Turn the ignition off. Disconnect the Radio harness connector. Replace fuse #5 in the Junction Block. Remove and inspect fuse #5 in the Junction Block. Is the fuse open? Yes → Repair the Fused B+ circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Remove and inspect fuse #30 in the Junction Block. Is the fuse open? Yes → Go To 6 No → Go To 8	All
6	Turn the ignition off. Replace fuse #30 in the Junction Block. Turn the ignition on. Turn the radio on. Turn the ignition off. Remove and inspect fuse #30 in the Junction Block. Is the fuse open? Yes → Go To 7 No → Replace fuse #30 in the Junction Block. Refer to the wiring diagrams located in the service information to help isolate a possible intermittent short to ground condition. Perform BODY VERIFICATION TEST - VER 1.	All
7	Turn the ignition off. Disconnect the Radio harness connector. Replace fuse #30 in the Junction Block. Cycle the ignition switch from on to off. Remove and inspect fuse #30 in the Junction Block. Is the fuse open? Yes → Repair the Fused Ignition Switch Output circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.	All

*NO SOUND FROM ALL SPEAKERS — Continued

TEST	ACTION	APPLICABILITY
8	Turn the ignition off. Disconnect the Radio harness connector. Using a 12-volt test light connected to ground, probe the Fused B+ circuit. Is the test light illuminated? Yes → Go To 9 No → Repair the Fused B+ circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
9	Turn the ignition off. Disconnect the Radio harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output circuit. Is the test light illuminated? Yes → Go To 10 No → Repair the Fused Ignition Switch Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
10	Turn the ignition off. Disconnect the Radio harness connector. Using a 12-volt test light connected to 12-volts, probe the radio ground circuit. Is the test light illuminated? Yes → Go To 11 No → Repair the ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
11	**NOTE: If vehicle is not equipped with a power amplifier, answer yes to the question.** Turn the ignition off. Disconnect the Power Amplifier harness connector. Using a 12-volt test light connected to ground, probe both Fused B+ circuits. Is the test light illuminated for both circuits? Yes → Go To 12 No → Repair the Fused B+ circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
12	**NOTE: If vehicle is not equipped with a power amplifier, answer yes to the question.** Turn the ignition off. Disconnect the Power Amplifier harness connector. Using a 12-volt test light connected to 12-volts, probe both Ground circuits. Is the test light illuminated for both circuits? Yes → Go To 13 No → Repair the Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

*NO SOUND FROM ALL SPEAKERS — Continued

TEST	ACTION	APPLICABILITY
13	**NOTE: If vehicle is not equipped with a power amplifier, answer yes to the question.** Turn the ignition off. Disconnect the Radio harness connector. Disconnect the Power Amplifier harness connector. Measure the resistance of the Enable Signal to Amplifier circuit between the Radio connector and the Power Amplifier connector. Is the resistance below 5.0 ohms? Yes → Go To 14 No → Repair the Enable Signal to Amplifier circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
14	**NOTE: If vehicle is not equipped with a power amplifier, answer no to the question.** Turn the ignition off. Disconnect the Radio harness connector. Disconnect the Power Amplifier harness connector. Measure the resistance between ground and the Enable Signal to Amplifier circuit. Is the resistance below 5.0 ohms? Yes → Repair the Enable Signal to Amplifier circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 15	All
15	**NOTE: If vehicle is not equipped with a power amplifier, answer no to the question.** While back probing, measure the voltage of any speaker (+) circuit in the Radio connector. Turn the ignition and radio on. Is the voltage approximately 5.5 volts? Yes → Go To 16 No → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.	All
16	Turn the ignition off. Disconnect the Power Amplifier harness connector. Turn the ignition and Radio on. Measure the voltage of the Enable Signal to Amplifier circuit in the Power Amplifier connector. Is the voltage above 10.0 volts? Yes → Replace the Power Amplifier. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*REMOTE RADIO CONTROLS INOPERATIVE

POSSIBLE CAUSES
OPEN RADIO CONTROL MUX CIRCUIT AT THE SWITCH
OPEN RADIO CONTROL MUX RETURN CIRCUIT AT THE SWITCH
REMOTE RADIO SWITCH
BODY CONTROL MODULE - INTERNAL SHORT
OPEN CLOCKSPRING
OPEN RADIO CONTROL MUX CIRCUIT
OPEN RADIO CONTROL MUX RETURN CIRCUIT
BODY CONTROL MODULE - OPEN INTERNAL

TEST	ACTION	APPLICABILITY
1	**NOTE: If any DTCs are set, diagnose the DTC before continuing.** Turn the ignition and radio on. Operate both remote radio switches. Are both remote radio control switches inoperative? Yes → Go To 2 No → Go To 7	All
2	Turn the ignition off. Disconnect the Clockspring C3 harness connector. Turn the ignition on. With the DRB, enter Body Computer then Sensors and monitor the Radio Control SW voltage. Is the voltage approximately 5.0 volts? Yes → Go To 3 No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Disconnect the Clockspring C3 harness connector. Turn the ignition on. Connect a jumper wire between cavity 1 and cavity 2 at the Clockspring C3 connector. With the DRB, enter Body Computer then Sensors and monitor the Radio Control SW voltage. Is the voltage approximately 0.0 volts? Yes → Check the circuits between the clockspring connector and the splice for an open. If ok, replace the Clockspring. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All

*REMOTE RADIO CONTROLS INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the Clockspring C3 harness connector. Disconnect the BCM C2 harness connector. Measure the resistance of the Radio Control MUX circuit between the BCM C2 connector and the Clockspring C3 connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Radio Control MUX circuit for an open between the clockspring and the BCM. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Disconnect the Clockspring C3 harness connector. Disconnect the BCM C2 harness connector. Measure the resistance of the Radio Control MUX Return circuit between the BCM C2 connector and the Clockspring C3 connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the Radio Control MUX Return circuit for an open between the clockspring and the BCM. Perform BODY VERIFICATION TEST - VER 1.	All
6	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All
7	**WARNING: Turn the ignition off, disconnect the battery and wait 2 minutes before proceeding.** **CAUTION: Do not place an intact undeployed airbag module face down on a hard surface, the airbag module will propel into the air if accidently deployed.** Remove the Driver Airbag Module. Disconnect both remote radio switch harness connectors. Turn the ignition on, reconnect the battery. Measure the voltage of the Radio Control MUX circuit at the inoperative remote radio switch. Is the voltage approximately 5.0 volts? Yes → Go To 8 No → Repair the Radio Control MUX circuit for an open between the inoperative switch and the splice. Perform BODY VERIFICATION TEST - VER 1.	All

*REMOTE RADIO CONTROLS INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
8	**WARNING: Turn the ignition off, disconnect the battery and wait 2 minutes before proceeding.** **CAUTION: Do not place an intact undeployed airbag module face down on a hard surface, the airbag module will propel into the air if accidently deployed.** Remove the Driver Airbag Module. Disconnect both remote radio switch harness connectors. Disconnect the Clockspring C4 harness connector. Measure the resistance of the Radio Control MUX Return circuit between the inoperative remote radio switch and the clockspring connector. Is the resistance below 5.0 ohms? Yes → Go To 9 No → Repair the Radio Control MUX Return circuit for an open between the inoperative switch and the clockspring. Perform BODY VERIFICATION TEST - VER 1.	All
9	If there are no possible causes remaining, view repair. Repair Replace the inoperative Remote Radio Switch. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
CHIME INOPERATIVE WITH KEY IN IGNITION, DRIVER DOOR OPEN

POSSIBLE CAUSES
OPEN KEY-IN SWITCH
KEY-IN IGN SWITCH GROUND CIRCUIT OPEN
KEY-IN IGN SWITCH SENSE CIRCUIT OPEN
BODY CONTROL MODULE - KEY-IN IGNITION OPEN
DOOR AJAR PROBLEMS

TEST	ACTION	APPLICABILITY
1	**Note: Ensure the interior lamps turn on and off properly.** **Note: Ensure the exterior lamps turn on and off properly.** Remove the key from the ignition switch. With the DRBIII® select: Body, INPUT OUTPUT, KEY IN IGN SW Insert the key in to the ignition switch. With the DRBIII®, read key in ignition switch status. Does the DRBIII® display; KEY IN IGN SW :CLOSED? Yes → Refer to Door Ajar information for the related symptoms. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Ignition switch C2 connector. With the ignition key in. Using an Ohmmeter, check the resistance across the Ignition Switch Is the resistance above 10.0 ohms? Yes → Replace the Ignition Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn ignition off. Disconnect the Ignition Switch C2 connector. Measure the resistance between ground and the Ground circuit. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open Key-in Ignition Switch Ground circuit. Perform BODY VERIFICATION TEST - VER 1.	All
4	Turn ignition off. Disconnect the Ignition Switch C2 connector. Disconnect the Body Control Module C1 connector. Measure the resistance of the Key-in Ignition Switch Sense circuit between the BCM C1 connector and the Ignition Switch C2 connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the open Key-in Ignition Switch Sense Wire. Perform BODY VERIFICATION TEST - VER 1.	All

CHIME INOPERATIVE WITH KEY IN IGNITION, DRIVER DOOR OPEN — Continued

TEST	ACTION	APPLICABILITY
5	If there are no possible causes remaining, view Repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*CHIME INOPERATIVE AT ALL TIMES

POSSIBLE CAUSES
ACTUATES OK
BODY CONTROL MODULE - CHIME INOPERATIVE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Close all doors. With the DRBIII®, actuate the Chime. Does the chime sound when actuated by the DRB? Yes → If the chime operates as it should, check for other reasons that the chime is being inoperative. Refer to symptom list for related problems. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*CHIME INOPERATIVE WITH DRIVERS SEAT BELT UNFASTENED

POSSIBLE CAUSES
SEAT BELT STATUS INCORRECT ON DRB
SEAT BELT SWITCH OPEN
GROUND WIRE OPEN
JUNCTION BLOCK - SEAT BELT SWITCH SENSE OPEN
SEAT BELT SWITCH SENSE WIRE OPEN

TEST	ACTION	APPLICABILITY
1	Ensure the Drivers Seat Belt is not fastened. With the DRBIII® select, Body Computer and then Input/Output. Turn the ignition on. Read the Seat Belt Sw Status on the DRBIII®. Does the DRBIII® display Seat Belt Sw Closed? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Seat Belt Switch connector. Connect a jumper wire between Seat Belt Switch Sense circuit and the Ground circuit in the Seat Belt Switch connector. With the DRBIII® select Body, Body Computer and then inputs/Outputs. Turn the ignition on. Read the Seat Belt Sw Status. Does the DRBIII® display Seat Belt Sw Closed? Yes → Replace the Seat Belt Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Disconnect the Seat Belt Switch connector. Connect a jumper wire between the Seat Belt Switch Sense circuit and chassis ground. With the DRB III select: Body, Body Computer, Input Output. Read the Seat Belt Sw, status. Does the DRB III show Seat Belt Sw: CLOSED? Yes → Repair the open Ground wire. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All

*CHIME INOPERATIVE WITH DRIVERS SEAT BELT UNFASTENED — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Lower the Junction Block and gain access to the Junction Block C1 connector but do not disconnect. Back probe a jumper wire between the Seat Belt Switch Sense circuit in the Junction Block C1 connector cavity 19 in the upper right corner to ground. Remove the Body Control Module from the Junction Block. Measure the resistance between ground and the Seat Belt Switch Sense ckt in the Junction Block - Body Control Module connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.	All
5	Lower the Junction Block and gain access to the Junction Block C1 connector, but do not disconnect. Back probe a jumper wire between the Seat Belt Switch Sense circuit in the Junction Block C1 connector cavity 19 in the upper right corner to ground. With the DRB III select: Body, Body Computer, Input Output. Read the Seat Belt Sw status. Does the DRB III show Seat Belt Sw: CLOSED? Yes → Repair the open Seat Belt Switch Sense wire. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
*CHIME INOPERATIVE WITH EXTERIOR LAMPS, DRIVER DOOR OPEN

POSSIBLE CAUSES
DRB TEST HEADLAMP SWITCH
DOOR AJAR PROBLEMS
EXTERIOR LIGHTING PROBLEMS

TEST	ACTION	APPLICABILITY
1	**Note: Ensure the interior lamps turn on and off properly.** **Note: Ensure the exterior lamps turn on and off properly.** Remove the key from the ignition switch. With the DRBIII® select: Body, Monitor Display, Lighting Monitor. Open the Driver door. With the DRBIII®, read the Driver Door Switch status. Does the DRBIII® display Closed? Yes → Go To 2 No → Refer to Door Ajar information for the related symptoms. Perform BODY VERIFICATION TEST - VER 1.	All
2	**Note: Ensure the interior lamps turn on and off properly.** **Note: Ensure the exterior lamps turn on and off properly.** Remove the key from the ignition switch. With the DRB III select: Body, Monitor Display, Lighting Monitor. Read the Headlamp Switch voltage while turning the Parklamps on. Does the DRBIII® display: 2.0 to 3.2 volts? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Refer to Exterior Lighting information for the related symptoms. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*CHIME SOUNDS WITH DRIVER DOOR OPEN

POSSIBLE CAUSES
KEY-IN IGN SWITCH STATUS WRONG
KEY-IN IGNITION SWITCH CIRCUIT SHORTED
KEY-IN IGN SWITCH SENSE WIRE SHORT TO GROUND
BODY CONTROL MODULE - KEY-IN IGNITION SHORTED

TEST	ACTION	APPLICABILITY
1	**Note: Ensure the interior lamps turn on and off properly.** **Note: Ensure the exterior lamps turn on and off properly.** Remove the key from the ignition switch. With the DRB III select: Body, Body Computer, Input Output. Turn off; Headlamps and Parklamps. Read the Key-In Ignition status. Does the DRB III show Key-In Ign OPEN? Yes → No problem found at this time. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Ignition Switch C2 connector. With the DRB III select: Body, Body Computer, Input Output. Read the Key-In Ignition status. Does the DRB III show: Key-In Ign, CLOSED? Yes → Go To 3 No → Replace the Ignition Switch. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn ignition off. Disconnect the Ignition Switch C2 connector. Disconnect the Body Control Module C1 connector. Measure the resistance of the Key-in Ignition Switch Sense circuit to chassis ground. Is the resistance below 100.0 ohms? Yes → Repair the Key-in Ignition Switch Sense wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	If there are no possible causes remaining, view Repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*CHIME SOUNDS WITH DRIVER SEAT BELT FASTENED

POSSIBLE CAUSES
SEAT BELT SWITCH STATUS WRONG
SEAT BELT SWITCH SHORTED
BODY CONTROL MODULE - SEAT BELT SWITCH SHORTED
SEAT BELT SWITCH SENSE WIRE SHORT TO GROUND
JUNCTION BLOCK - SEAT BELT SWITCH SENSE SHORTED

TEST	ACTION	APPLICABILITY
1	Ensure the drivers seat belt is fastened. With the DRB III select: Body, Body Computer, Input Output. Turn the ignition on. Read the Seat Belt Sw, status. Does the DRB III show Seat Belt Sw: CLOSED? Yes → Go To 2 No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All
2	Disconnect the Seat Belt Switch connector. With the DRB III select: Body, Body Computer, Input Output. Turn the ignition on. Read the Seat Belt Sw. status. Does the DRB III show Seat Belt Sw: CLOSED? Yes → Go To 3 No → Replace the Seat Belt Switch. Perform BODY VERIFICATION TEST - VER 1.	All
3	Remove the BCM from the Junction Block. Disconnect the Seat Belt Switch connector. Turn the ignition off. Measure the resistance between ground and the Seat Belt Switch Sense circuit in the Seat Belt Switch connector.. Is the resistance below 100.0 ohms? Yes → Go To 4 No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All
4	Turn the ignition off. Disconnect the Seat Belt Switch connector. Remove the BCM from the Junction Block. Disconnect the Junction Block C1 connector. Measure the resistance between ground and the Seat Belt Switch Sense circuit in the Seat Belt Switch connector.. Is the resistance below 100.0 ohms? Yes → Repair the Seat Belt Switch Sense wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All

*CHIME SOUNDS WITH DRIVER SEAT BELT FASTENED — Continued

TEST	ACTION	APPLICABILITY
5	If there are no possible causes remaining, view Repair. Repair Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*VEHICLE SPEED WARNING CHIME PROBLEM

POSSIBLE CAUSES
COUNTRY CODE IN BODY CONTROL MODULE
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Ensure there is communication between the BCM and the PCM and that there are no related DTC's before continuing. **NOTE: The high speed warning Chime is for Gulf Coast Countries only.** With the DRBIII®, read the Country Code setting in module display. Is the country code setting correct? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Select the correct country code for the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
BATTERY IOD DISCONNECT AT BCM

When Monitored and Set Condition:

BATTERY IOD DISCONNECT AT BCM

When Monitored: Each time the DRB request DTC's from the BCM, the BCM check for battery voltage on the IOD circuit.

Set Condition: The DTC will set if the BCM detects a low or no voltage condition on the IOD circuit.

POSSIBLE CAUSES
VERIFYING ACTIVE DTC
PDC FUSE #15
CHECK FUSED B+ FEED TO JUNCTION BLOCK
JUNCTION BLOCK IOD FAILURE
BODY CONTROL MODULE
FUSED B(+) CIRCUIT SHORTED TO GROUND
JUNCTION BLOCK FUSE #7

TEST	ACTION	APPLICABILITY
1	Connect the DRB to the Data Link Connector. Turn the ignition on. With the DRB, erase BCM DTC's. Turn the ignition off then turn the ignition on. With the DRB, read BCM DTC's. **NOTE: If DTC is active check Junction Block fuse #7 for an open.** Does the DRB display: Battery IOD Disconnect at BCM? Yes → Go To 2 No → No problem found at this time. Use the wiring diagrams located in the service information to help isolate a possible intermittent wiring problem. Perform BODY VERIFICATION TEST - VER 1.	All
2	Inspect fuse #15 in the Power Distribution Center. Is the fuse open? Yes → Re-install or replace PDC fuse #15. Use the wiring diagrams located in the service information to help isolate a possible intermittent wiring problem. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

BATTERY IOD DISCONNECT AT BCM — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Junction Block C4 harness connector. Using a 12-volt test light connected to ground, probe the Fused B+ circuit in the Junction Block C4 connector (cavity 1). Is the test light illuminated? Yes → Go To 4 No → Repair the Fused B+ circuit for an open between the Junction Block and the PDC. Perform BODY VERIFICATION TEST - VER 1.	All
4	Inspect the IOD fuse in the Junction Block (Fuse #7). Is the fuse open? Yes → Go To 5 No → Go To 6	All
5	Turn the ignition off. Remove Fuse #7 from the Junction Block. Measure the resistance between ground and the Fused B+ circuit at the junction block fuse #7 (output side of fuse). Is the resistance below 100.0 ohms? Yes → Refer to the wiring diagrams located in the service information to help isolate a short to ground condition. Perform BODY VERIFICATION TEST - VER 1. No → Replace the fuse. Perform BODY VERIFICATION TEST - VER 1.	All
6	Install fuse #7 in the Junction Block. Remove the BCM from the Junction Block. Using a 12-volt test light connected to ground, probe the Fused B+ circuit in the junction block body control module connector cavity 26. Is the test light illuminated? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Junction Block in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
BCM EEPROM CHECKSUM FAILURE

When Monitored and Set Condition:

BCM EEPROM CHECKSUM FAILURE

When Monitored: Each time the DRB request DTC's from the BCM, the BCM runs an EEPROM checksum test.

Set Condition: The DTC will set if the BCM detects an EEPROM checksum failure.

POSSIBLE CAUSES
BCM INTERNAL EEPROM FAILURE

TEST	ACTION	APPLICABILITY
1	Connect the DRB to the Data Link Connector. Turn the ignition on. With the DRB, erase BCM DTC's. Turn the ignition off then turn the ignition on. With the DRB, read BCM DTC's. Did this DTC reset? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
BCM FLASH CHECKSUM FAILURE

When Monitored and Set Condition:

BCM FLASH CHECKSUM FAILURE

When Monitored: Each time the DRB performs the flash process, the BCM runs a flash checksum test.

Set Condition: The DTC will set if the BCM detects a flash checksum failure.

POSSIBLE CAUSES
BCM INTERNAL FLASH CHECKSUM FAILURE

TEST	ACTION	APPLICABILITY
1	Connect the DRB to the Data Link Connector. Turn the ignition on. With the DRB, erase BCM DTC's. Turn the ignition off then turn the ignition on. With the DRB, read BCM DTC's. Did this DTC reset? Yes → Reflash or Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
DDM MESSAGE NOT RECEIVED

When Monitored and Set Condition:

DDM MESSAGE NOT RECEIVED

When Monitored: With the ignition in run, and the IOD fuse installed.

Set Condition: The BCM does not receive any messages from the Driver Door Module (DDM) for at least 30 seconds.

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH THE DOOR MODULES
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, enter Body then Door Module. Was the DRB able to I/D or communicate with the Door Modules? Yes → Go To 2 No → Refer to the Communication category and perform the symptom Bus +/- Signals Open or No Response from Driver Door Module. Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRB, erase DTC's. Turn the ignition on and wait approximately 1 minute. With the DRB, read DTC's. Did this DTC reset? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
MIC MESSAGE NOT RECEIVED AT BCM

When Monitored and Set Condition:

MIC MESSAGE NOT RECEIVED AT BCM

When Monitored: With the ignition in run, and the IOD fuse installed.

Set Condition: The BCM does not receive any messages from the Instrument Cluster (MIC) for at least 30 seconds.

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH THE INSTRUMENT CLUSTER (MIC)
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, enter Body then Electro/Mech Cluster. Was the DRB able to I/D or communicate with the Instrument Cluster (MIC)? Yes → Go To 2 No → Refer to the Communication category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRB, erase DTC's. Turn the ignition on and wait approximately 1 minute. With the DRB, read DTC's. Did this DTC reset? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
NO PCI MESSAGES FROM CD CHANGER

When Monitored and Set Condition:

NO PCI MESSAGES FROM CD CHANGER

When Monitored: With the ignition on and the radio on.

Set Condition: If the DRB interrogates the CD changer and does not receive the proper response from the CD changer.

POSSIBLE CAUSES
CD CHANGER (DIN) CABLE
CD CHANGER PCI BUS CIRCUIT OPEN
IGNITION SWITCH OUTPUT CIRCUIT OPEN
RADIO GROUND CKT OPEN
CD CHANGER

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the Radio C2 connector (DIN cable) from the Radio and the CD Changer. Visually inspect the cable for damage. In the next step check for open wires in the DIN cable. Measure the resistance of the each DIN cable circuit between the Radio DIN cable connector and the CD Changer DIN cable connector. In the next step check for wires shorted to the DIN cable metal connectors. Measure the resistance between each Radio C2 connector (DIN cable) circuit and the cable's metal connector. Are the DIN cable circuits shorted together or open? Yes → Replace the CD Changer (DIN) cable. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All

NO PCI MESSAGES FROM CD CHANGER — Continued

TEST	ACTION	APPLICABILITY
2	Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII® select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Disconnect the CD Changer harness connector (DIN cable). Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the CD Changer DIN Cable connector. Reconnect the Radio C2 (DIN Cable) harness connector. Turn the ignition on. Turn the Radio and CD Changer on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Go To 3 No → Repair the PCI Bus circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Disconnect the CD Changer harness connector (DIN cable). Turn the ignition on. Turn the Radio and the CD Changer on. Using a 12-volt test light connected to ground, probe the ignition switch output circuit in the CD Changer DIN Cable connector. Is the test light illuminated? Yes → Go To 4 No → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.	All
4	Turn the ignition off. Disconnect the CD Changer harness connector (DIN cable). Using a 12-volt test light connected to 12-volts, probe each CD Changer ground circuit in the CD Changer connector (DIN cable). Is the test light illuminated for each circuit? Yes → Replace the CD Changer. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
PCM MESSAGE NOT RECEIVED AT BCM

When Monitored and Set Condition:

PCM MESSAGE NOT RECEIVED AT BCM

When Monitored: With the ignition in run, and the IOD fuse installed.

Set Condition: The BCM does not receive any messages from the PCM for at least 30 seconds.

POSSIBLE CAUSES
PCM MESSAGE NOT RECEIVED AT BCM
ATTEMPT TO COMMUNICATE WITH THE PCM
PCI BUS CIRCUIT OPEN
POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, enter Body Computer, System Tests then PCM Monitor. Does the DRB display: PCM is active on BUS? Yes → Replace the Body Control Module in accordance with the service information.. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition on. With the DRB, attempt to communicate with the PCM. Was the DRB able to communicate with the PCM? Yes → Go To 3 No → Refer to the communication category and perform the appropriate symptom. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Disconnect the PCM harness connectors. Connect the diagnostic junction port tester #8339 to the diagnostic junction port. **Note: Do not connect the tester to the DRB.** Measure the resistance of the PCI Bus circuit between the diagnostic junction port tester and the PCM connector. Is the resistance below 5.0 ohms? Yes → Replace the Powertrain Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Repair the PCI Bus circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
PDM MESSAGE NOT RECEIVED

When Monitored and Set Condition:

PDM MESSAGE NOT RECEIVED

When Monitored: With the ignition in run, and the IOD fuse installed.

Set Condition: The BCM does not receive any messages from the Passenger Door Module (PDM) for at least 30 seconds.

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH THE DOOR MODULES
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, enter Body then Door Module. Was the DRB able to I/D or communicate with the Door Modules? Yes → Go To 2 No → Refer to the Communication category and perform the symptom Bus +/- Signals Open or No Response from Passenger Door Module. Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRB, erase DTC's. Turn the ignition on and wait approximately 1 minute. With the DRB, read DTC's. Did this DTC reset? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
RAIN SENSOR MESSAGES NOT RECEIVED

When Monitored and Set Condition:

RAIN SENSOR MESSAGES NOT RECEIVED

When Monitored: With the ignition in run, and the IOD fuse installed.

Set Condition: The BCM does not receive any messages from the rain sensor module.

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH THE RAIN SENSOR MODULE
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, attempt to communicate with the rain sensor module. Was the DRB able to I/D or communicate with the rain sensor module? Yes → Go To 2 No → Refer to the Communication category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRB, erase DTC's. Turn the ignition on and wait approximately 1 minute. With the DRB, read DTC's. Did this DTC reset? Yes → Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:

*BUS +/- SIGNALS OPEN OR NO RESPONSE FROM AUTOMATIC ZONE CONTROL MODULE

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH THE BCM
FUSED B(+) CKT OPEN
FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
OPEN PCI BUS CIRCUIT
AUTOMATIC ZONE CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, enter Body then Body Computer. Was the DRB able to I/D or communicate with the BCM? Yes → Go To 2 No → Refer to the symptom list for problems related to no communication with the BCM. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Automatic Zone Control Module C2 harness connector. Using a 12-volt test light connected to ground, probe the Fused B+ circuit. Is the test light illuminated? Yes → Go To 3 No → Repair the Fused B+ circuit for an open or short. Refer to the wiring diagrams in the service information. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Disconnect the Automatic Zone Control Module C2 harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output circuit. Is the test light illuminated? Yes → Go To 4 No → Repair the Fused Ignition Switch Output circuit for an open or short. Refer to the wiring diagrams in the service information. Perform BODY VERIFICATION TEST - VER 1.	All

*BUS +/- SIGNALS OPEN OR NO RESPONSE FROM AUTOMATIC ZONE CONTROL MODULE — Continued

TEST	ACTION	APPLICABILITY
4	**Note: Ensure there is PCI Bus communication with other modules on the vehicle before proceeding. If not, refer to the symptom list from the menu and repair as necessary.** Disconnect the Automatic Zone Control Module C2 harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII® select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set the probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the AZC connector. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Go To 5 No → Repair the PCI Bus circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
5	If there are no possible causes remaining, view repair. Repair Replace the Automatic Zone Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*BUS +/- SIGNALS OPEN OR NO RESPONSE FROM BODY CONTROL MODULE

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH ANOTHER MODULE
OPEN GROUND CIRCUIT
OPEN PCI BUS CIRCUIT
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, attempt to communicate with the Airbag Control Module (ACM). With the DRB, attempt to communicate with the Controller Antilock Brake (CAB) module. Was the DRB able to I/D or communicate with the ACM and the CAB? Yes → Go To 2 No → Refer to symptom list for problems related to the PCI Bus Communication Failure. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the BCM C1 harness connector. Using a 12-volt test light connected to 12-volts, probe the ground circuit (cavity 1). Is the test light illuminated? Yes → Go To 3 No → Repair the ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

*BUS +/- SIGNALS OPEN OR NO RESPONSE FROM BODY CONTROL MODULE — Continued

TEST	ACTION	APPLICABILITY
3	**Note: Ensure there is PCI Bus communication with other modules on the vehicle before proceeding. If not, refer to the symptom list from the menu and repair as necessary.** Disconnect the BCM C1 harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII® select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the BCM connector. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Go To 4 No → Repair the PCI Bus circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
4	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*BUS +/- SIGNALS OPEN OR NO RESPONSE FROM DRIVER DOOR MODULE

POSSIBLE CAUSES
OPEN FUSED B+ CIRCUIT
OPEN GROUND CIRCUIT
OPEN PCI BUS CIRCUIT
DRIVER DOOR MODULE

TEST	ACTION	APPLICABILITY
1	**Note: Ensure there is PCI Bus communication with other modules on the vehicle before proceeding. If not, refer to the symptom list from the menu and repair as necessary.** Turn the ignition off. Disconnect the Driver Door Module C1 harness connector. Using a 12-volt test light connected to ground, probe the Fused B+ circuit. Is the test light illuminated? Yes → Go To 2 No → Repair the Fused B+ circuit for an open or short, refer to the wiring diagrams in the service information. Perform BODY VERIFICATION TEST - VER 1.	All
2	**Note: Ensure there is PCI Bus communication with other modules on the vehicle before proceeding. If not, refer to the symptom list from the menu and repair as necessary.** Turn the ignition off. Disconnect the Driver Door Module C1 harness connector. Using a 12-volt test light connected to 12-volts, probe the ground circuit. Is the test light illuminated? Yes → Go To 3 No → Repair the ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

*BUS +/- SIGNALS OPEN OR NO RESPONSE FROM DRIVER DOOR MODULE — Continued

TEST	ACTION	APPLICABILITY
3	**Note: Ensure there is PCI Bus communication with other modules on the vehicle before proceeding. If not, refer to the symptom list from the menu and repair as necessary.** Disconnect the Driver Door Module C1 harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII® select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII® select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the VIC connector. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Go To 4 No → Repair the PCI Bus circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
4	If there are no possible causes remaining, view repair. Repair Replace the Vehicle Information Center in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*NO RESPONSE FROM ADJUSTABLE PEDALS MODULE

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH THE BCM
FUSED B(+) CKT OPEN
GROUND CKT OPEN
OPEN PCI BUS CIRCUIT
ADJUSTABLE PEDALS MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, enter Body then Body Computer. Was the DRB able to I/D or communicate with the BCM? Yes → Go To 2 No → Refer to the symptom list for problems related to no communication with the BCM. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Adjustable Pedals Module harness connector. Using a 12-volt test light connected to ground, probe the Fused B+ circuit. Is the test light illuminated? Yes → Go To 3 No → Repair the Fused B+ circuit for an open or short. Refer to the wiring diagrams in the service information. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Disconnect the Adjustable Pedals Module harness connector. Using a 12-volt test light connected to 12-volts, probe each ground circuit. Is the test light illuminated for each circuit? Yes → Go To 4 No → Repair the Ground circuit for an open. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1.	All

*NO RESPONSE FROM ADJUSTABLE PEDALS MODULE — Continued

TEST	ACTION	APPLICABILITY
4	**Note: Ensure there is PCI Bus communication with other modules on the vehicle before proceeding. If not, refer to the symptom list from the menu and repair as necessary.** Disconnect the Adjustable Pedals Module harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII® select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set the probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the Adjustable Pedals Module connector. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Replace the Adjustable Pedals Module in accordance with the service information. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1. No → Repair the PCI Bus circuit for an open. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1.	All

Symptom:
*NO RESPONSE FROM AIRBAG CONTROL MODULE

POSSIBLE CAUSES
CHECKING FOR VOLTAGE AT ACM
GROUND CIRCUIT OPEN
OPEN PCI BUS CIRCUIT
AIRBAG CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure there is PCI Bus communication with other modules on the vehicle before proceeding. If not, refer to the symptom list from the menu and repair as necessary.** Ensure that the battery is fully charged. **WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Airbag Control Module harness connectors. Connect the appropriate Load Tool ACM adaptor to the ACM connector. Turn the ignition on and then reconnect the Battery. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output (Run) Circuit and the Fused Ignition Switch Output (Run/Start) Circuit at the ACM connector. NOTE: One open circuit will not cause a NO RESPONSE condition. Is the test light illuminated on both circuits? Yes → Go To 2 No → Repair the Fused Ignition Switch Output (Run) and Fused Ignition Switch Output (Run/Start) circuits for an open. Perform AIRBAG VERIFICATION TEST - VER 1. **NOTE: When reconnecting airbag system components, the ignition must be turned off and the battery must be disconnected.**	All
2	**WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.** Disconnect the Airbag Control Module harness connectors. Connect the appropriate Load Tool ACM adaptor to the ACM connector. Using a 12-volt test light connected to 12-volts, probe the ground circuit. **NOTE: Make sure test light is connected to the Battery positive terminal.** Is the test light illuminated? Yes → Go To 3 No → Repair the ground circuit for an open. Perform AIRBAG VERIFICATION TEST - VER 1. **Note: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All

*NO RESPONSE FROM AIRBAG CONTROL MODULE — Continued

TEST	ACTION	APPLICABILITY
3	**Note: Ensure there is PCI Bus communication with other modules on the vehicle before proceeding. If not, refer to the symptom list from the menu and repair as necessary.** Turn the ignition off and wait 2 minutes before proceeding. Disconnect the Airbag Control Module harness connectors. Connect the appropriate Load Tool ACM adaptor to the ACM connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII® select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the ACM connector. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Replace the Airbag Control Module in accordance with the Service Information. Perform AIRBAG VERIFICATION TEST - VER 1. No → Repair the PCI Bus circuit for an open. Perform AIRBAG VERIFICATION TEST - VER 1. **NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**	All

Symptom:
*NO RESPONSE FROM AMPLIFIER

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH THE RADIO
GROUND CIRCUIT OPEN
FUSED B(+) CIRCUIT OPEN
OPEN PCI BUS CIRCUIT
AMPLIFIER

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. **NOTE: The Radio must be turned on for the DRB to get a response from the Amplifier.** With the DRB, attempt to communicate with the Radio. Was the DRB able to I/D or communicate with the Radio? Yes → Go To 2 No → Refer to the symptom list for problems related to no communication with the Radio. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Amplifier C1 harness connector. Using a 12-volt test light connected to 12-volts, probe both ground circuits. Is the test light illuminated for both circuits? Yes → Go To 3 No → Repair the ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Disconnect the Amplifier C1 harness connector. Using a 12-volt test light connected to ground, probe both Fused B(+) circuits. Is the test light illuminated for both circuits? Yes → Go To 4 No → Repair the Fused B+ circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

*NO RESPONSE FROM AMPLIFIER — Continued

TEST	ACTION	APPLICABILITY
4	**Note: Ensure there is PCI Bus communication with other modules on the vehicle before proceeding. If not, refer to the symptom list from the menu and repair as necessary.** Disconnect the Amplifier C1 harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII® select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the Amplifier connector. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Replace the Amplifier in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Repair the PCI Bus circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*NO RESPONSE FROM CONTROLLER ANTILOCK BRAKE

POSSIBLE CAUSES
NO RESPONSE FROM CAB
REPLACE FUSE #19
CONTROLLER ANTILOCK BRAKE SHORTED TO GROUND
FUSED IGNITION SWITCH OUTPUT CIRCUIT SHORTED TO GROUND
JUNCTION BLOCK SHORTED TO GROUND
GROUND CIRCUIT OPEN
OPEN FUSED IGNITION SWITCH OUTPUT CIRCUIT
OPEN PCI BUS CIRCUIT
CONTROLLER ANTILOCK BRAKE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. **Note: As soon as one or more module communicates with the DRB, answer the question.** With the DRB, attempt to communicate with the Airbag Control Module (ACM). With the DRB, attempt to communicate with the Body Control Module (BCM). Was the DRB able to I/D or establish communications with either of the modules? Yes → Go To 2 No → Refer to the Communications category and perform the symptom PCI Bus Communication Failure. Perform ABS VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Remove and inspect fuse #19 in the junction block. Is the fuse open? Yes → Go To 3 No → Go To 6	All
3	Turn the ignition off. Replace Fuse #19 in the junction block. Turn the ignition on. Remove and inspect fuse #19 in the junction block. Is the fuse open? Yes → Go To 4 No → Check the Fused Ignition Switch Output circuit for an intermittent short to ground, refer to the wiring diagrams in the service information. Perform ABS VERIFICATION TEST - VER 1.	All

*NO RESPONSE FROM CONTROLLER ANTILOCK BRAKE — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Replace fuse #19 in the junction block. Disconnect the CAB harness connector. Turn the ignition on. Remove and inpsect fuse #19 in the junction block. Is the fuse open? Yes → Go To 5 No → Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Disconnect the CAB harness connector. Disconnect the Junction Block C2 harness connector. Measure the resistance between ground and the Fused Ignition Switch Output circuit. Is the resistance below 5.0 ohms? Yes → Repair the Fused Ignition Switch Output circuit for a short to ground. Perform ABS VERIFICATION TEST - VER 1. No → Replace the Junction Block in accordance with the service information. Perform ABS VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. Disconnect the CAB harness connector. Using a 12-volt test light connected to 12-volts, probe each ground circuit. Is the test light illuminated for each circuit? Yes → Go To 7 No → Repair the ground circuit(s) for an open. Perform ABS VERIFICATION TEST - VER 1.	All
7	Turn the ignition off. **Note: Ensure fuse #19 is installed in the junction block.** Disconnect the CAB harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output circuit. Is the test light illuminated? Yes → Go To 8 No → Repair the Fused Ignition Switch Output circuit for an open. Perform ABS VERIFICATION TEST - VER 1.	All

*NO RESPONSE FROM CONTROLLER ANTILOCK BRAKE — Continued

TEST	ACTION	APPLICABILITY
8	**Note: Ensure there is PCI Bus communication with other modules on the vehicle before proceeding. If not, refer to the symptom list from the menu and repair as necessary.** Disconnect the CAB harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII® select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the CAB connector. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Go To 9 No → Repair the PCI Bus circuit for an open. Perform ABS VERIFICATION TEST - VER 1.	All
9	If there are no possible causes remaining, view repair. Repair Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.	All

Symptom:
*NO RESPONSE FROM ECM (PCI BUS) - DIESEL ONLY

POSSIBLE CAUSES
ECM PCI NO RESPONSE
PCI BUS CIRCUIT OPEN
ENGINE CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. **NOTE: As soon as one or more module communicates with the DRB, answer the question.** With the DRB, enter Body then Body Computer. With the DRB, enter Anti-Lock Brakes. With the DRB, enter Body then Electro/Mechanical Cluster (MIC). With the DRB, enter Passive Restraints then Airbag. Were you able to establish communications with any of the modules? Yes → Go To 2 No → Refer to symptom PCI Bus Communication Failure in the Communications category. Perform ROAD TEST VERIFICATION - VER-2.	All
2	With the DRB read ECM Diagnostic Trouble Codes. This is to ensure power and grounds to the ECM are operational. **NOTE: If the DRB will not read ECM DTCs, follow the NO RESPONSE TO ECM (SCI only) symptom path, if vehicle will start. For NO START Conditions follow the no start symptom in the powertrain diagnostic information.** Turn the ignition off. Disconnect the ECM C1 harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII® select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to ground. Connect the Red lead to the PCI Bus circuit in the ECM connector. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2. No → Repair the PCI Bus circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All

Symptom:
*NO RESPONSE FROM ECM (SCI ONLY) - DIESEL ONLY

POSSIBLE CAUSES
CHECK ECM POWERS AND GROUNDS
SCI TRANSMIT CIRCUIT SHORTED TO VOLTAGE
TRANSMISSION CONTROL MODULE
SCI TRANSMIT CIRCUIT SHORTED TO GROUND
SCI TRANSMIT CIRCUIT OPEN
ENGINE CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Perform the symptom Checking ECM Power and Ground Circuits in the Driveability category. Did the vehicle pass this test? Yes → Go To 2 No → Repair as necessary. Perform ROAD TEST VERIFICATION - VER-2.	All
2	Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the DRB from the DLC. Measure the resistance between ground and the SCI Transmit circuit. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Go To 4	All
3	Turn the ignition off. Disconnect the TCM C1 harness connector. Measure the resistance between ground and the SCI Transmit circuit. Is the resistance below 5.0 ohms? Yes → Repair the SCI Transmit circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2. No → Replace the Transmission Control Module in accordance with the service information. Perform ROAD TEST VERIFICATION - VER-2.	All
4	Turn the ignition off. Disconnect the DRB from the DLC. Disconnect the ECM harness connectors. Disconnect the TCM C1 harness connector. Turn the ignition on. Measure the voltage of the SCI Transmit circuit at the DLC connector (cav 7). Is the voltage above 1.0 volt? Yes → Repair the SCI Transmit circuit for a short to voltage. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 5	All

*NO RESPONSE FROM ECM (SCI ONLY) - DIESEL ONLY — Continued

TEST	ACTION	APPLICABILITY
5	Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the DRB from the DLC. Measure the resistance of the SCI Transmit circuit between the ECM connector and the DLC. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the SCI Transmit circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
6	If there are no possible causes remaining, view repair. Repair Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.	All

Symptom:
*NO RESPONSE FROM INTRUSION TRANSCEIVER MODULE

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH THE BCM
GROUND CIRCUIT OPEN
FUSED B(+) CIRCUIT OPEN
OPEN PCI BUS CIRCUIT
INTRUSION TRANSCEIVER MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, attempt to communicate with the BCM. Was the DRB able to I/D or communicate with the BCM? Yes → Go To 2 No → Refer to the symptom list for problems related to no communication with the BCM. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Intrusion Transceiver Module harness connector. Using a 12-volt test light connected to 12-volts, probe the ground circuit. Is the test light illuminated? Yes → Go To 3 No → Repair the ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Disconnect the Intrusion Transceiver Module harness connector. Using a 12-volt test light connected to ground, probe the Fused B(+) circuit. Is the test light illuminated? Yes → Go To 4 No → Repair the Fused B+ circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

*NO RESPONSE FROM INTRUSION TRANSCEIVER MODULE — Continued

TEST	ACTION	APPLICABILITY
4	**Note: Ensure there is PCI Bus communication with other modules on the vehicle before proceeding. If not, refer to the symptom list from the menu and repair as necessary.** Disconnect the Intrusion Transceiver Module harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII® select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the ITM connector. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Replace the Intrusion Transceiver Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Repair the PCI Bus circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*NO RESPONSE FROM PCM (PCI BUS) - GAS ONLY

POSSIBLE CAUSES
PCM PCI NO RESPONSE
PCI BUS CIRCUIT OPEN
POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. **NOTE: As soon as one or more module communicates with the DRB, answer the question.** With the DRBIII®, enter Body then Body Computer. With the DRBIII®, enter Anti-Lock Brakes. With the DRBIII®, enter Body then Electro/Mechanical Cluster (MIC). With the DRBIII®, enter Passive Restraints then Airbag. Were you able to establish communications with any of the modules? Yes → Go To 2 No → Refer to symptom PCI Bus Communication Failure in the Communications category. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
2	With the DRBIII® read PCM Diagnostic Trouble Codes. This is to ensure power and grounds to the PCM are operational. **NOTE: If the DRB will not read PCM DTC's, follow the NO RESPONSE TO PCM (SCI only) symptom path.** **NOTE: If the vehicle will not start and the DRBIII® displays a no response message, refer to the appropriate symptom in the powertrain diagnostic procedures.** Turn the ignition off. Disconnect the PCM C3 harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRBIII®. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII® select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the PCM ground. Connect the Red lead to the PCI Bus circuit in the PCM connector. Turn the ignition on. Observe the voltage display on the DRBIII® Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Repair the PCI Bus circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

Symptom:

*NO RESPONSE FROM PCM (SCI ONLY) - GAS ONLY

POSSIBLE CAUSES
CHECK PCM POWERS AND GROUNDS
SCI TRANSMIT CIRCUIT SHORTED TO VOLTAGE
SCI RECEIVE CIRCUIT SHORTED TO VOLTAGE
TRANSMISSION CONTROL MODULE
SCI CIRCUITS SHORTED TOGETHER
SCI TRANSMIT CIRCUIT SHORTED TO GROUND
SCI RECEIVE CIRCUIT SHORTED TO GROUND
SCI RECEIVE CIRCUIT OPEN
SCI TRANSMIT CIRCUIT OPEN
POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Perform the symptom Checking PCM Power and Ground Circuits in the Driveability category. **NOTE: With the DRBIII® in the generic scan tool mode, attempt to communicate with the PCM.** **NOTE: If the DRBIII® can communicate with the PCM in the generic scan tool mode, it may not be necessary to perform this step.** Did the vehicle pass this test? Yes → Go To 2 No → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
2	Turn the ignition off. Disconnect the PCM C3 harness connector. Disconnect the DRBIII® from the DLC. Measure the resistance between ground and the SCI Transmit circuit. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Go To 4	All
3	Turn the ignition off. Disconnect the TCM harness connector (if equipped). **NOTE: If vehicle is not equipped with a TCM, answer yes to the question.** Measure the resistance between ground and the SCI Transmit circuit. Is the resistance below 5.0 ohms? Yes → Repair the SCI Transmit circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Replace the Transmission Control Module in accordance with the service information. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

*NO RESPONSE FROM PCM (SCI ONLY) - GAS ONLY — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the DRBIII® from the DLC. Disconnect the PCM harness connectors. Disconnect the TCM harness connector (if equipped). Turn the ignition on. Measure the voltage of the SCI Transmit circuit. Is the voltage above 1.0 volt? Yes → Repair the SCI Transmit circuit for a short to voltage. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 5	All
5	Turn the ignition off. Disconnect the DRBIII® from the DLC. Disconnect the PCM harness connectors. Turn the ignition on. Measure the voltage of the SCI Receive circuit. Is the voltage above 1.0 volt? Yes → Repair the SCI Receive circuit for a short to voltage. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 6	All
6	Turn the ignition off. Disconnect the DRBIII® from the DLC. Disconnect the PCM harness connectors. Measure the resistance between the SCI Transmit circuit and the SCI Receive circuit at the PCM connector. Is the resistance below 5.0 ohms? Yes → Repair the short between the SCI Transmit and the SCI Receive circuits. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 7	All
7	Turn the ignition off. Disconnect the PCM C3 harness connector. Disconnect the DRBIII® from the DLC. Measure the resistance between ground and the SCI Receive circuit. Is the resistance below 5.0 ohms? Yes → Repair the SCI Receive circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 8	All
8	Turn the ignition off. Disconnect the PCM C3 harness connector. Disconnect the DRBIII® from the DLC. Measure the resistance of the SCI Receive circuit between the PCM C3 connector and the DLC. Is the resistance below 5.0 ohms? Yes → Go To 9 No → Repair the SCI Receive circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

*NO RESPONSE FROM PCM (SCI ONLY) - GAS ONLY — Continued

TEST	ACTION	APPLICABILITY
9	Turn the ignition off. Disconnect the PCM C3 harness connector. Disconnect the DRBIII® from the DLC. Measure the resistance of the SCI Transmit circuit between the PCM C3 connector and the DLC. Is the resistance below 5.0 ohms? Yes → Go To 10 No → Repair the SCI Transmit circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
10	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

Symptom:
*NO RESPONSE FROM RADIO

POSSIBLE CAUSES
NO RESPONSE FROM RADIO
REPLACE FUSE #30
RADIO SHORTED TO GROUND
FUSED IGNITION SWITCH OUTPUT CIRCUIT SHORTED TO GROUND
JUNCTION BLOCK SHORTED TO GROUND
OPEN FUSED IGNITION SWITCH OUTPUT CIRCUIT
OPEN FUSED B+ CIRCUIT
RADIO GROUND CIRCUIT OPEN
OPEN PCI BUS CIRCUIT
RADIO

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. **Note: As soon as one or more module communicates with the DRB, answer the question.** With the DRB, attempt to communicate with the Airbag Control Module (ACM). With the DRB, attempt to communicate with the Body Control Module (BCM). Was the DRB able to I/D or establish communications with either of the modules? Yes → Go To 2 No → Refer to the Communications category and perform the symptom PCI Bus Communication Failure. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Remove and inspect fuse #30 in the junction block. Is the fuse open? Yes → Go To 3 No → Go To 6	All
3	Turn the ignition off. Replace Fuse #30 in the junction block. Turn the ignition on. Turn the Radio on. Remove and inspect fuse #30 in the junction block. Is the fuse open? Yes → Go To 4 No → Check the Fused Ignition Switch Output circuit for an intermittent short to ground, refer to the wiring diagrams in the service information. Perform BODY VERIFICATION TEST - VER 1.	All

*NO RESPONSE FROM RADIO — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Replace fuse #30 in the junction block. Disconnect the Radio C1 harness connector. Turn the ignition on. Remove and inpsect fuse #30 in the junction block. Is the fuse open? Yes → Go To 5 No → Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Disconnect the Radio C1 harness connector. Disconnect the Junction Block C3 harness connector. Measure the resistance between ground and the Fused Ignition Switch Output circuit. Is the resistance below 5.0 ohms? Yes → Repair the Fused Ignition Switch Output circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Junction Block in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. **Note: Ensure fuse #30 is installed in the junction block.** Disconnect the Radio C1 harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output circuit. Is the test light illuminated? Yes → Go To 7 No → Repair the Fused Ignition Switch Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
7	Turn the ignition off. Disconnect the Radio C1 harness connector. Using a 12-volt test light connected to ground, probe each Fused B+ circuit. Is the test light illuminated for each circuit? Yes → Go To 8 No → Repair the Fused B+ circuit for an open. Refer to the wiring diagrams located in the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
8	Turn the ignition off. Disconnect the Radio C1 harness connector. Using a 12-volt test light connected to 12-volts, probe each ground circuit. Is the test light illuminated for each circuit? Yes → Go To 9 No → Repair the ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

*NO RESPONSE FROM RADIO — Continued

TEST	ACTION	APPLICABILITY
9	**Note: Ensure there is PCI Bus communication with other modules on the vehicle before proceeding. If not, refer to the symptom list from the menu and repair as necessary.** Disconnect the Radio C1 harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII® select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the Radio connector. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Go To 10 No → Repair the PCI Bus circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
10	If there are no possible causes remaining, view repair. Repair Replace the Radio. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*NO RESPONSE FROM RAIN SENSOR

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH THE BCM
FUSED B(+) CKT OPEN
GROUND CKT OPEN
OPEN PCI BUS CIRCUIT
RAIN SENSOR

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, enter Body then Body Computer. Was the DRB able to I/D or communicate with the BCM? Yes → Go To 2 No → Refer to the symptom list for problems related to no communication with the BCM. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Rain Sensor harness connector. Using a 12-volt test light connected to ground, probe the Fused B+ circuit. Is the test light illuminated? Yes → Go To 3 No → Repair the Fused B+ circuit for an open or short. Refer to the wiring diagrams in the service information. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Disconnect the Rain Sensor harness connector. Using a 12-volt test light connected to 12-volts, probe the ground circuit. Is the test light illuminated? Yes → Go To 4 No → Repair the Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

*NO RESPONSE FROM RAIN SENSOR — Continued

TEST	ACTION	APPLICABILITY
4	**Note: Ensure there is PCI Bus communication with other modules on the vehicle before proceeding. If not, refer to the symptom list from the menu and repair as necessary.** Disconnect the Rain Sensor harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII® select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set the probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the Rain Sensor connector. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Replace the Rain Sensor in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Repair the PCI Bus circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*NO RESPONSE FROM SHIFTER ASSEMBLY - DIESEL ONLY

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH THE BCM
OPEN GROUND CIRCUIT
OPEN FUSED IGNITION SWITCH OUTPUT CIRCUIT
OPEN PCI BUS CIRCUIT
SHIFTER ASSEMBLY

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, enter Body then Body Computer. Was the DRB able to I/D or communicate with the BCM? Yes → Go To 2 No → Refer to the symptom list for problems related to no communication with the BCM. Perform W5AJ400 TRANSMISSION VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Shifter Assembly C1 harness connector. Using a 12-volt test light connected to 12-volts, probe each ground circuit. Is the test light illuminated for each circuit? Yes → Go To 3 No → Repair the ground circuit for an open. Perform W5AJ400 TRANSMISSION VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Disconnect the Shifter Assembly C1 and C2 harness connectors. Turn the ignition on. Using a 12-volt test light connected to ground, probe each Fused Ignition Switch Output circuit. Is the test light illuminated for each circuit? Yes → Go To 4 No → Repair the Fused Ignition Switch Output circuit for an open or short. Refer to the wiring diagrams in the service information. Perform W5AJ400 TRANSMISSION VERIFICATION TEST - VER 1.	All

*NO RESPONSE FROM SHIFTER ASSEMBLY - DIESEL ONLY — Continued

TEST	ACTION	APPLICABILITY
4	**Note: Ensure there is PCI Bus communication with other modules on the vehicle before proceeding. If not, refer to the symptom list from the menu and repair as necessary.** Disconnect the Shifter Assembly C1 harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII® select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the Shifter Assembly connector. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Replace the Shifter Assembly in accordance with the service information. Perform W5AJ400 TRANSMISSION VERIFICATION TEST - VER 1. No → Repair the PCI Bus circuit for an open. Perform W5AJ400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:

*NO RESPONSE FROM TRANSMISSION CONTROL MODULE - DIESEL ONLY

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH THE ECM
FUSED IGNITION SWITCH OUTPUT (RUN/ST) CIRCUIT OPEN
GROUND CIRCUIT OPEN
SCI TRANSMIT CIRCUIT OPEN
TRANSMISSION CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, attempt to communicate with the ECM. Was the DRB able to I/D or communicate with the ECM? Yes → Go To 2 No → Refer to the symptom list for problems related to no communication with the ECM (SCI Only). Perform W5AJ400 TRANSMISSION VERIFICATION TEST - VER 1.	All
2	Turn the ignition off to the lock position. Disconnect the TCM C1 harness connector. Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Fused Ignition Switch Output (Run/St) circuit. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 3 No → Repair the Fused Ignition Switch Output (Run/St) circuit for an open. Refer to the wiring diagrams in the Service Information. Perform W5AJ400 TRANSMISSION VERIFICATION TEST - VER 1.	All
3	Turn the ignition off to the lock position. Disconnect the TCM C1 harness connector. Using a 12-volt test light connected to 12-volts, check the ground circuit in the TCM harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 4 No → Repair the Ground circuit for an open. Perform W5AJ400 TRANSMISSION VERIFICATION TEST - VER 1.	All

*NO RESPONSE FROM TRANSMISSION CONTROL MODULE - DIESEL ONLY — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the TCM C1 harness connector. Disconnect the DRB from the DLC. Measure the resistance of the SCI Transmit circuit between the TCM connector and the DLC. Is the resistance below 5.0 ohms? Yes → Replace the Transmission Control Module in accordance with the service information. Perform W5AJ400 TRANSMISSION VERIFICATION TEST - VER 1. No → Repair the SCI Transmit circuit for an open. Perform W5AJ400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
*NO RESPONSE FROM TRANSMISSION CONTROL MODULE - GAS ONLY

POSSIBLE CAUSES
NO RESPONSE FROM TRANSMISSION CONTROL MODULE
FUSED IGNITION SWITCH OUTPUT (RUN/ST) CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT (START) CIRCUIT OPEN
FUSED B(+) CIRCUIT OPEN
GROUND CIRCUIT(S) OPEN
OPEN PCI BUS CIRCUIT
TRANSMISSION CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. **Note: As soon as one or more module communicates with the DRB, answer the question.** With the DRB, attempt to communicate with the Airbag Control Module (ACM). With the DRB, attempt to communicate with the Body Control Module (BCM). Was the DRB able to I/D or establish communications with either of the modules? Yes → Go To 2 No → Refer to the Body Communication category and perform the symptom PCI Bus Communication Failure. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	All
2	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Fused Ignition Switch Output (Run/St) circuit. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 3 No → Repair the Fused Ignition Switch Output (Run/St) circuit for an open. Refer to the wiring diagrams location in the Service Information. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	All

*NO RESPONSE FROM TRANSMISSION CONTROL MODULE - GAS ONLY — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Remove the starter relay from the PDC. Using a 12-volt test light connected to ground, check the Fused Ignition Switch Output (Start) circuit. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Observe the test light while momentarily turning the ignition switch to the Start position. Does the test light illuminate brightly? Yes → Go To 4 No → Repair the Fused Ignition Switch Output (Start) circuit for an open. Refer to the wiring diagrams located in the Service Information. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. **Note: Reinstall the original Starter Relay.**	All
4	Turn the ignition off. Disconnect the TCM harness connector. Using a 12-volt test light connected to ground, check the Fused B(+) circuit. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 5 No → Repair the Fused B(+) circuit for an open. Refer to the wiring diagrams located in the Service Information. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	All
5	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Using a 12-volt test light connected to 12-volts, check each ground circuit in the TCM harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly at all the ground circuits? Yes → Go To 6 No → Repair the Ground circuit(s) for an open. Check the main ground connection to engine block and/or chassis. Refer to the wiring diagrams located in the Service Information. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	All

*NO RESPONSE FROM TRANSMISSION CONTROL MODULE - GAS ONLY — Continued

TEST	ACTION	APPLICABILITY
6	**Note: Ensure there is PCI Bus communication with other modules on the vehicle before proceeding. If not, refer to the symptom list from the menu and repair as necessary.** Disconnect the TCM harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII® select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the TCM connector. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Go To 7 No → Repair the PCI Bus circuit for an open. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	All
7	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
*PCI BUS COMMUNICATION FAILURE

POSSIBLE CAUSES
WITH THE DRB PERFORM A MODULE SCAN
OPEN PCI BUS CIRCUIT AT THE DATA LINK CONNECTOR
USING THE DRB, PERFORM THE PCI BUS CONTROL MODE
DISCONNECT THE MODULE(S) HARNESS CONNECTOR
PCI BUS CIRCUIT SHORTED TO VOLTAGE
DISCONNECT THE MODULE(S) HARNESS CONNECTOR
PCI BUS CIRCUIT SHORTED TO GROUND
WIRING HARNESS INTERMITTENT FAILURE

TEST	ACTION	APPLICABILITY
1	**Note: Determine which modules this vehicle is equipped with before beginning.** Connect the Diagnostic Junction Port Tester #8339 to the DRB and to the Diagnostic Junction Port. Using the DRB, along with the Diagnostic Junction Port Tester #8339, select Junction Port Tool then PCI Bus Module Scan and follow the instructions on the DRB. Was the DRB able to scan (I/D or communicate) with any modules? Yes → Refer to the Communication category for the related symptom(s). (Individual module no responses). Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Measure the resistance of the PCI Bus circuit between the Data Link Connector and the Diagnostic Junction Port connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the PCI Bus circuit for an open between the DLC and the Diagnostic Junction Port. Perform BODY VERIFICATION TEST - VER 1.	All

*PCI BUS COMMUNICATION FAILURE — Continued

TEST	ACTION	APPLICABILITY
3	**Note: Determine which modules this vehicle is equipped with before beginning.** Connect the Diagnostic Junction Port Tester #8339 to the DRB and to the Diagnostic Junction Port. Using the DRB, along with the Diagnostic Junction Port Tester #8339, select Junction Port Tool then PCI Bus Control Mode and follow the instructions on the DRB. **Note: Perform this function on each pin that is equipped with a PCI Bus circuit.** Did the DRB display No Modules Responding from any of the pins that were scanned? Yes → Go To 4 No → Check the PCI Bus circuit between the DLC and the Diagnostic Junction Port connector for a short to voltage or to ground, repair as necessary. Perform BODY VERIFICATION TEST - VER 1.	All
4	Disconnect the Diagnostic Junction Port Tester cable from the DRB. Keep the tester connected to the Diagnostic Junction Port. Turn the ignition on. Measure the voltage of the PCI Bus circuit on the Diagnostic Junction Port Tester that the DRB displayed No Modules Responding. Is the voltage steadily above 7.0 volts? Yes → Go To 5 No → Go To 6	All
5	Measure the voltage of the PCI Bus circuit on the Diagnostic Junction Port tester that previously measured above 7.0 volts. **Note: Turn the ignition off before disconnecting any module harness connector then turn the ignition on.** Disconnect the module harness connector(s). **NOTE: If the problem occurred on a bus circuit that has more than one module on the same circuit, observe the voltmeter while disconnecting each module connector one at a time.** Is the voltage steadily above 7.0 volts with the module(s) disconnected? Yes → Repair the PCI Bus circuit that measured over 7.0 volts for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Replace the module that when disconnected the short to voltage was eliminated. Perform BODY VERIFICATION TEST - VER 1.	All
6	Disconnect the Diagnostic Junction Port Tester cable from the DRB. Keep the tester connected to the Diagnostic Junction Port. Turn the ignition off. Disconnect the negative battery cable. Measure the resistance between ground and the PCI Bus circuit on the Diagnostic Junction Port Tester that the DRB displayed No Modules Responding. Is the resistance below 100.0 ohms? Yes → Go To 7 No → Go To 8	All

*PCI BUS COMMUNICATION FAILURE — Continued

TEST	ACTION	APPLICABILITY
7	Disconnect the negative battery cable. Measure the resistance between ground and the PCI Bus circuit at the Diagnostic Junction Port tester that previously measured below 100.0 ohms. Disconnect the module harness connector(s). **NOTE: If the problem occurred on a bus circuit that has more than one module on the same circuit, observe the ohmmeter while disconnecting each module connector one at a time.** Is the resistance below 100.0 ohms with the module(s) disconnected? Yes → Repair the PCI Bus circuit that measured below 100.0 ohms for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the module that when disconnected the short to ground was eliminated. Perform BODY VERIFICATION TEST - VER 1.	All
8	Turn the ignition off. **Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.** **Note: Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.** Were any problems found? Yes → Repair wiring harness/connectors as necessary. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:

*UNABLE TO ACCESS DRIVER DOOR MODULE AND/OR PASSENGER DOOR MODULE WITH DRBIII®

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH THE BCM
CHECK BCM DTCS
INSPECT JUNCTION BLOCK FUSE #22 AND #28
CHECK VOLTAGE SUPPLY TO BCM - JUNCTION BLOCK BCM CONNECTOR CAVITY 5
CHECK VOLTAGE SUPPLY TO BCM - JUNCTION BLOCK BCM CONNECTOR CAVITY 25
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, enter Body then Body Computer. Was the DRB able to I/D or communicate with the BCM? Yes → Go To 2 No → Refer to the symptom list for problems related to no communication with the BCM. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition on. With the DRB, enter Body then Body Computer and read DTC's. Are any DTCs present? Yes → Refer to the appropriate category and perform the diagnostic test associated with the DTC that is set. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Remove and inspect fuse #22 and #28 from the junction block. Is either fuse open? Yes → Refer to the wiring diagrams in the service information to help isolate a possible short to ground condition, replace fuse and retest. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All

*UNABLE TO ACCESS DRIVER DOOR MODULE AND/OR PASSENGER DOOR MODULE WITH DRBIII® — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. **Note: Ensure Fuse #22 is installed in the junction block.** Remove the BCM from the Junction Block. Turn the ignition on. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output circuit at the Junction Block Body Control Module connector cavity 5. Is the test light illuminated? Yes → Go To 5 No → Replace the Junction Block in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. **NOTE: Ensure Fuse #28 is installed in the junction block.** Remove the BCM from the Junction Block. Turn the ignition on. Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output circuit at the Junction Block Body Control Module connector cavity 25. Is the test light illuminated? Yes → Go To 6 No → Replace the Junction Block in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.	All
6	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
* DRIVER DOOR AJAR CIRCUIT SHORTED TO GROUND

POSSIBLE CAUSES
DRIVER DOOR LOCK MOTOR/AJAR SWITCH SHORTED TO GROUND
DRIVER DOOR AJAR SWITCH SENSE CKT SHORTED TO GROUND
DRIVER DOOR MODULE

TEST	ACTION	APPLICABILITY
1	With the DRBIII® in Inputs/Outputs, read the DR DOOR AJAR SW state. Disconnect the Driver Door Lock Motor/Ajar Switch harness connector. With the DRBIII® in Inputs/Outputs, read the DR DOOR AJAR SW state. Does the Switch State change from CLOSED to OPEN? Yes → Replace the Driver Door Lock Motor/Ajar Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the DDM harness connector. Disconnect the Driver Door Lock Motor/Ajar Switch harness connector. Using a 12-volt Test Light connected to 12-volts, check the Sense circuit. Does the Test Light illuminate? Yes → Repair the Driver Door Ajar Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Driver Door Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*DRIVER DOOR AJAR CIRCUIT OPEN

POSSIBLE CAUSES
DRIVER DOOR MODULE NOT RESPONDING TO INPUT
OPEN DRIVER DOOR AJAR SWITCH GROUND CKT
OPEN DRIVER DOOR LOCK MOTOR/AJAR SWITCH
OPEN DRIVER DOOR AJAR SWITCH SENSE CKT
DRIVER DOOR MODULE

TEST	ACTION	APPLICABILITY
1	Open the driver door. With the DRBIII® in Inputs/Outputs, read the DRVR DOOR AJAR SW state. Does the DRBIII® display CLOSED? Yes → Replace the Driver Door Module. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Driver Door Lock Motor/Ajar switch connector Using a 12-volt Test Light connected to 12-volts, check the Ground circuit. Does the light illuminate? Yes → Go To 3 No → Repair the Driver Door Ajar Switch Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
3	Disconnect the Driver Door Lock Motor/Ajar Switch connector. With the DRBIII® in Inputs/Outputs, read the DRVR DOOR AJAR SW state. Connect a jumper wire between Sense circuit and the Ground circuit. Does the DRBIII® display DRVR DOOR AJAR SW: CLOSED? Yes → Replace the Driver Door Lock Motor/Ajar Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Disconnect the DDM harness connector. Disconnect the Driver Door Lock Motor/Ajar Switch harness connector. Measure the resistance of the Sense circuit. Is the resistance below 5.0 ohms? Yes → Replace the Driver Door Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Driver Door Ajar Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*HOOD AJAR CIRCUIT OPEN (IF EQUIPPED)

POSSIBLE CAUSES
BCM NOT RESPONDING TO INPUT
GROUND CIRCUIT OPEN
HOOD AJAR SWITCH OPEN
HOOD AJAR SWITCH SENSE CIRCUIT OPEN
BODY CONTROL MODULE, INTERNAL OPEN

TEST	ACTION	APPLICABILITY
1	Open the hood. With the DRBIII® in Inputs/Outputs, read the HOOD AJAR SW state. Does the DRBIII® display CLOSED? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Hood Ajar Switch harness connector. Using a 12-volt Test Light connected to 12-volts, check the Ground circuit. Does the test light illuminate? Yes → Go To 3 No → Repair the ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
3	Disconnect the Hood Ajar Switch harness connector. Connect a jumper wire between the Sense circuit and the Ground circuit. With the DRBIII® in Inputs/Outputs, read the HOOD AJAR SW state. Does the DRBIII® display CLOSED? Yes → Replace the Hood Ajar Switch, Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Disconnect the Hood Ajar Switch harness connector. Disconnect the BCM C1 harness connector. Measure the resistance of the Sense circuit. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Hood Ajar Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*HOOD AJAR CIRCUIT SHORT TO GROUND (IF EQUIPPED)

POSSIBLE CAUSES
HOOD AJAR SWITCH SHORT TO GROUND
HOOD AJAR SWITCH SENSE CIRCUIT, SHORT TO GROUND
BCM, SHORT TO GROUND

TEST	ACTION	APPLICABILITY
1	With the DRBIII® in Inputs/Outputs, read the Hood Open Sw state. Disconnect the Hood Ajar Switch harness connector. With the DRBIII® in Inputs/Outputs, read the HOOD AJAR SW state. Does the Switch State change from CLOSED to OPEN? Yes → Replace the Hood Ajar Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the BCM harness connector. Disconnect the Hood Ajar Switch harness connector. Using a 12-volt Test Light connected to 12-volts, check the Sense circuit. Does the Test Light illuminate? Yes → Repair the Hood Ajar Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*LEFT REAR DOOR AJAR CIRCUIT OPEN

POSSIBLE CAUSES
BCM NOT RESPONDING TO INPUT
GROUND CKT OPEN
LEFT REAR DOOR LOCK MOTOR/AJAR SWITCH OPEN
LEFT REAR DOOR AJAR SWITCH SENSE CKT OPEN
JUNCTION BLOCK - OPEN LEFT REAR DOOR AJAR SWITCH SENSE CKT
BODY CONTROL MODULE INTERNAL FAULT

TEST	ACTION	APPLICABILITY
1	Open the left rear door. With the DRBIII® in Inputs/Outputs, read the LR DOOR AJAR SW state. Does the DRBIII® display CLOSED? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Left Rear Door Lock Motor/Ajar Switch harness connector. Using a 12-volt Test Light connected to 12-volts, check the Ground circuit. Does the test light illuminate? Yes → Go To 3 No → Repair the ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
3	Disconnect the Left Rear Door Lock Motor/Ajar Switch harness connector. Connect a jumper wire between the Sense circuit and the Ground circuit. With the DRBIII® in Inputs/Outputs, read the LR DOOR AJAR SW state. Does the DRBIII® display CLOSED? Yes → Replace the Left Rear Door Lock Motor/Ajar Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Disconnect the Left Rear Door Lock Motor/Ajar Switch harness connector. Disconnect the Junction Block C1 harness connector. Measure the resistance of the Sense circuit. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Left Rear Door Ajar Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

*LEFT REAR DOOR AJAR CIRCUIT OPEN — Continued

TEST	ACTION	APPLICABILITY
5	Disconnect the Junction Block C1 harness connector. Remove the BCM from the Junction Block. Measure the resistance of the Left Rear Door Ajar Switch Sense circuit across the Junction Block between the C1 connector and the Junction Block-to-BCM connector. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Junction Block in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*LEFT REAR DOOR AJAR CIRCUIT SHORTED TO GROUND

POSSIBLE CAUSES
LEFT REAR DOOR LOCK MOTOR/AJAR SWITCH SHORTED TO GROUND
LEFT REAR DOOR AJAR SWITCH SENSE CKT SHORTED TO GROUND
BODY CONTROL MODULE INTERNAL FAULT
LEFT REAR DOOR AJAR SWITCH SENSE CKT SHORTED TO GROUND IN JUNCTION BLOCK

TEST	ACTION	APPLICABILITY
1	With the DRBIII® in Inputs/Outputs, read the LR DOOR AJAR SW state. Disconnect the Left Rear Door Lock Motor/Ajar Switch harness connector. With the DRBIII® in Inputs/Outputs, read the LR DOOR AJAR SW state. Does the Switch State change from CLOSED to OPEN? Yes → Replace the Left Rear Door Lock Motor/Ajar Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Junction Block C1 harness connector. Disconnect the Left Rear Door Lock Motor/Ajar Switch harness connector. Using a 12-volt Test Light connected to 12-volts, check the Sense circuit. Does the Test Light illuminate? Yes → Repair the Left Rear Door Ajar Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Disconnect the BCM from the Junction Block. Using a 12-volt Test Light connected to 12-volts, check the Sense circuit. Does the test light illuminate? Yes → Replace the Junction Block in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*LIFTGATE AJAR CIRCUIT OPEN

POSSIBLE CAUSES
BCM NOT RESPONDING TO INPUT
GROUND CIRCUIT OPEN
LIFTGATE AJAR SWITCH SENSE CIRCUIT OPEN
JUNCTION BLOCK - OPEN LIFTGATE AJAR CIRCUIT
BODY CONTROL MODULE-OPEN LIFTGATE AJAR CIRCUIT

TEST	ACTION	APPLICABILITY
1	Open the liftgate. With the DRBIII® in Inputs/Outputs, read the LIFTGATE AJAR SW state. Does the DRBIII® display CLOSED? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Right or Left Liftgate Ajar Switch harness connector. Using a 12-volt Test Light connected to 12-volts, check the Ground circuit. Does the test light illuminate? Yes → Go To 3 No → Repair the Liftgate Ajar Switch Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
3	Disconnect the Right or Left Liftgate Ajar Switch harness connector. Disconnect the Junction Block C1 harness connector. Measure the resistance of the Sense circuit. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the Liftgate Ajar Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
4	Disconnect the Junction Block C1 harness connector. Remove the BCM from the Junction Block. Measure the resistance of the Liftgate Ajar Switch Sense circuit across the Junction Block between the C1 connector and the Junction Block-to-BCM connector. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Junction Block in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*LIFTGATE AJAR CIRCUIT SHORT TO GROUND

POSSIBLE CAUSES
LEFT LIFTGATE AJAR SWITCH SHORT TO GROUND
RIGHT LIFTGATE AJAR SWITCH SHORT TO GROUND
LIFTGATE AJAR SWITCH SENSE CIRCUIT, SHORT TO GROUND
LIFTGATE AJAR SWITCH SENSE SHORT IN THE JUNCTION BLOCK
BCM, SHORT TO GROUND

TEST	ACTION	APPLICABILITY
1	With the DRBIII® in Inputs/Outputs, read the LIFTGATE AJAR SW state. Disconnect the Left Liftgate Ajar Switch harness connector. With the DRBIII® in Inputs/Outputs, read the LIFTGATE AJAR SW state. Does the Switch State change from CLOSED to OPEN? Yes → Replace the Left Liftgate Ajar Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	With the DRBIII® in Inputs/Outputs, read the LIFTGATE AJAR SW state. Disconnect the Right Liftgate Ajar Switch harness connector. With the DRBIII® in Inputs/Outputs, read the LIFTGATE AJAR SW state. Does the Switch State change from CLOSED to OPEN? Yes → Replace the Right Liftgate Ajar Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Disconnect the Junction Block C1 harness connector. Disconnect the Right and Left Liftgate Ajar Switch harness connectors. Using a 12-volt Test Light connected to 12-volts, check the Sense circuit. Does the Test Light illuminate? Yes → Repair the Liftgate Ajar Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Disconnect the BCM from the Junction Block. Using a 12-volt Test Light connected to 12-volts, check the Liftgate Ajar Switch Sense circuit. Does the test light illuminate? Yes → Replace the Junction Block in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*LIFTGATE FLIP-UP AJAR CIRCUIT OPEN

POSSIBLE CAUSES
BCM NOT RESPONDING TO INPUT
GROUND CIRCUIT OPEN
LIFTGATE FLIP-UP AJAR SWITCH OPEN
LIFTGATE FLIP-UP AJAR SWITCH SENSE CIRCUIT OPEN
JUNCTION BLOCK - OPEN LIFTGATE FLIP-UP AJAR SWITCH SENSE CIRCUIT
BODY CONTROL MODULE, INTERNAL OPEN

TEST	ACTION	APPLICABILITY
1	Open the liftgate flip-up. With the DRBIII® in Inputs/Outputs, read the LFTGT FLIP-UP AJAR state. Does the DRBIII® display CLOSED? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Liftgate Flip-Up Ajar Switch harness connector. Using a 12-volt Test Light connected to 12-volts, check the Ground circuit. Does the test light illuminate? Yes → Go To 3 No → Repair the ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
3	Disconnect the Liftgate Flip-Up Ajar Switch harness connector. Connect a jumper wire between the Sense circuit and the Ground circuit. With the DRBIII® in Inputs/Outputs, read the LFTGT FLIP-UP AJAR SW state. Does the DRBIII® display CLOSED? Yes → Replace the Liftgate Flip-Up Ajar Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Disconnect the Liftgate Flip-Up Ajar Switch harness connector. Disconnect the Junction Block C1 harness connector. Measure the resistance of the Sense circuit. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Liftgate Flip-Up Ajar Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

*LIFTGATE FLIP-UP AJAR CIRCUIT OPEN — Continued

TEST	ACTION	APPLICABILITY
5	Disconnect the Junction Block C1 harness connector. Remove the BCM from the Junction Block. Measure the resistance of the Liftgate Flip-Up Ajar Switch Sense circuit across the Junction Block between the C1 connector and the Junction Block-to-BCM connector. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Junction Block in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:

*LIFTGATE FLIP-UP AJAR CIRCUIT SHORT TO GROUND

POSSIBLE CAUSES
LIFTGATE FLIP-UP AJAR SWITCH SHORTED TO GROUND
LIFTGATE FLIP-UP AJAR SWITCH SENSE CKT SHORTED TO GROUND
BODY CONTROL MODULE INTERNAL FAULT
LIFTGATE FLIP-UP AJAR SENSE CKT SHORTED TO GROUND IN JUNCTION BLOCK

TEST	ACTION	APPLICABILITY
1	With the DRBIII® in Inputs/Outputs, read the LIFTGLASS SW state. Disconnect the Liftgate Flip-Up Ajar Switch harness connector. With the DRBIII® in Inputs/Outputs, read the LIFTGLASS SW state. Does the Switch State change from CLOSED to OPEN? Yes → Replace the Liftgate Flip-Up Ajar Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Junction Block C1 harness connector. Disconnect the Liftgate Flip-Up Ajar Switch harness connector. Using a 12-volt Test Light connected to 12-volts, check the Sense circuit. Does the Test Light illuminate? Yes → Repair the Liftgate Flip-Up Ajar Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Disconnect the BCM from the Junction Block. Using a 12-volt Test Light connected to 12-volts, check the Liftgate Flip-Up Ajar Switch Sense circuit. Does the test light illuminate? Yes → Replace the Junction Block in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*PASSENGER DOOR AJAR CIRCUIT OPEN

POSSIBLE CAUSES
PASSENGER DOOR MODULE
OPEN PASSENGER DOOR AJAR SWITCH GROUND CKT
OPEN PASSENGER DOOR LOCK MOTOR/AJAR SWITCH
OPEN PASSENGER DOOR AJAR SWITCH SENSE CKT
PASSENGER DOOR MODULE

TEST	ACTION	APPLICABILITY
1	Open the passenger door. With the DRBIII® in Inputs/Outputs, read the PASS DOOR AJAR SW state. Does the DRBIII® display CLOSED? Yes → Replace the Passenger Door Module. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Passenger Door Lock Motor/Ajar switch connector Using a 12-volt Test Light connected to 12-volts, check the Ground circuit. Does the light illuminate? Yes → Go To 3 No → Repair the Passenger Door Ajar Switch Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
3	Disconnect the Passenger Door Lock Motor/Ajar Switch harness connector. With the DRBIII® in Inputs/Outputs, read the PASS DOOR AJAR SW state. Connect a jumper wire between the Sense circuit and the Ground circuit. Does the DRBIII® display PASS DOOR AJAR SW: CLOSED? Yes → Replace the Passenger Door Lock Motor/Ajar Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Disconnect the PDM harness connector. Disconnect the Passenger Door Lock Motor/Ajar Switch harness connector. Measure the resistance of the Sense circuit. Is the resistance below 5.0 ohms? Yes → Replace the Passenger Door Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Passenger Door Ajar Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*PASSENGER DOOR AJAR CIRCUIT SHORT TO GROUND

POSSIBLE CAUSES
PASSENGER DOOR LOCK MOTOR/AJAR SWITCH SHORTED TO GROUND
PASSENGER DOOR AJAR SWITCH SENSE CKT SHORTED TO GROUND
PASSENGER DOOR MODULE

TEST	ACTION	APPLICABILITY
1	With the DRBIII® in Inputs/Outputs, read the PASS DOOR AJAR SW state. Disconnect the Passenger Door Lock Motor/Ajar Switch harness connector. With the DRBIII® in Inputs/Outputs, read the PASS DOOR AJAR SW state. Does the Switch State change from CLOSED to OPEN? Yes → Replace the Passenger Door Lock Motor/Ajar Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the PDM harness connector. Disconnect the Passenger Door Lock Motor/Ajar Switch harness connector. Using a 12-volt Test Light connected to 12-volts, check the Sense circuit. Does the Test Light illuminate? Yes → Repair the Passenger Door Ajar Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Passenger Door Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*RIGHT REAR DOOR AJAR CIRCUIT OPEN

POSSIBLE CAUSES
BCM NOT RESPONDING TO INPUT
GROUND CKT OPEN
RIGHT REAR DOOR AJAR SWITCH OPEN
RIGHT REAR DOOR AJAR SWITCH SENSE CIRCUIT OPEN
BODY CONTROL MODULE INTERNAL FAULT

TEST	ACTION	APPLICABILITY
1	Open the right rear door. With the DRBIII® in Inputs/Outputs, read the RR DOOR AJAR SW state. Does the DRBIII® display CLOSED? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Right Rear Door Ajar Switch harness connector. Using a 12-volt Test Light connected to 12-volts, check the Ground circuit. Does the test light illuminate? Yes → Go To 3 No → Repair the ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
3	Disconnect the Right Rear Door Ajar Switch harness connector. Connect a jumper wire between the Sense circuit and the Ground circuit. With the DRBIII® in Inputs/Outputs, read the RR DOOR AJAR SW state. Does the DRBIII® display CLOSED? Yes → Replace the Right Rear Door Lock Motor/Ajar Switch, Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Disconnect the Right Rear Door Ajar Switch harness connector. Disconnect the BCM C1 harness connector. Measure the resistance of the Sense circuit. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Right Rear Door Ajar Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*RIGHT REAR DOOR AJAR CIRCUIT SHORT TO GROUND

POSSIBLE CAUSES
RIGHT REAR DOOR LOCK MOTOR/AJAR SWITCH SHORTED TO GROUND
RIGHT REAR DOOR AJAR SWITCH SENSE CKT SHORTED TO GROUND
BODY CONTROL MODULE INTERNAL FAULT

TEST	ACTION	APPLICABILITY
1	With the DRBIII® in Inputs/Outputs, read the RR DOOR AJAR SW state. Disconnect the Right Rear Door Lock Motor/Ajar Switch harness connector. With the DRBIII® in Inputs/Outputs, read the RR DOOR AJAR SW state. Does the Switch State change from CLOSED to OPEN? Yes → Replace the Right Rear Door Lock Motor/Ajar Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the BCM harness connector. Disconnect the Right Rear Door Lock Motor/Ajar Switch harness connector. Using a 12-volt Test Light connected to 12-volts, check the Sense circuit. Does the Test Light illuminate? Yes → Repair the Right Rear Door Ajar Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:

DRIVER SEAT HEAT OUTPUT OPEN/SHT TO BATTERY (LAREDO)

When Monitored and Set Condition:

DRIVER SEAT HEAT OUTPUT OPEN/SHT TO BATTERY (LAREDO)

When Monitored: With the ignition on, during the heated seat operation.

Set Condition: This condition is set immediately after the Heated Seat Module loses the seat heat element output.

POSSIBLE CAUSES
DTC PRESENT
DRIVER SEAT HEATER SYSTEM SHORT TO BATTERY
DRIVER SEAT HEATER B(+) DRIVER CKT SHORTED TO VOLTAGE
DRIVER HEATED SEAT CUSHION SHORTED TO VOLTAGE
DRIVER SEAT HEATER GROUND CKT SHORTED TO VOLTAGE
HEATED SEAT DRIVER CKT SHORTED TO VOLTAGE
DRIVER HEATED SEAT CUSHION OPEN
DRIVER SEAT BACK HEATER OPEN
HEATED SEAT DRIVER CKT OPEN
DRIVER SEAT HEATER GROUND CKT OPEN
DRIVER SEAT HEATER B(+) DRIVER CKT OPEN

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase DTCs. Start the engine. Turn the driver seat heater on and operate in both ranges. With the DRBIII®, read DTCs. Did the DRIVER SEAT HEAT OUTPUT OPEN/SHORT TO BATTERY DTC return? Yes → Go To 2 No → The conditions required to set the code are currently not present. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

DRIVER SEAT HEAT OUTPUT OPEN/SHT TO BATTERY (LAREDO) — Continued

TEST	ACTION	APPLICABILITY
2	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C2 harness connector. Measure the total resistance of the Driver Seat Heat System between the Driver Seat Heater B(+) Driver and the Driver Seat Heater Ground circuits in the HSM C2 connector. Is the resistance below 50.0 ohms? Yes → Go To 3 No → Go To 7	All
3	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C2 harness connector. Turn the ignition on. Measure the voltage of the Driver Seat Heater B(+) Driver circuit. Is ANY voltage present on the Driver Seat Heater B(+) Driver circuit? Yes → Go To 4 No → Replace the Heated Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
4	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C2 harness connector. Disconnect the Driver Heated Seat Cushion 4-way connector. Turn the ignition on. Measure the voltage of the Driver Seat Heater B(+) Driver circuit. Is there ANY voltage on the Driver Seat Heater B(+) Driver circuit? Yes → Repair the Driver Seat Heater B(+) Driver circuit for a short to voltage. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 5	All
5	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C2 harness connector. Disconnect the Driver Heated Seat Back 4-way connector. Turn the ignition on. Measure the voltage of the Driver Seat Heater Ground circuit. Is there ANY voltage on the Driver Seat Heater Ground circuit? Yes → Go To 6 No → Replace the Driver Heated Seat Cushion. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

DRIVER SEAT HEAT OUTPUT OPEN/SHT TO BATTERY (LAREDO) — Continued

TEST	ACTION	APPLICABILITY
6	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C2 harness connector. Disconnect the Driver Heated Seat Back 2-way (green) connector. Disconnect the Driver Heated Seat Cushion 4-way connector. Turn the ignition on. Measure the voltage of the Driver Seat Heater Ground circuit. Is there ANY voltage on the Driver Seat Heater Ground circuit? Yes → Repair the Driver Seat Heater Ground circuit for a short to voltage. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Repair the Heated Seat Driver circuit for a short to voltage. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
7	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Disconnect the Driver Heated Seat Cushion 4-way connector. Measure the resistance of the CUSHION SEAT HEATER ELEMENT. Connect one lead to the Heated Seat Driver circuit (cushion side) and the other lead to the Driver Seat Heater B(+) Driver circuit (cushion side) in the Driver Heated Seat Cushion 4 way connector. Is the resistance below 3.0 ohms? Yes → Go To 8 No → Replace the Driver Heated Seat Cushion / Bolster. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
8	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Disconnect the Driver Heated Seat Back 2-way (green) connector. Measure the resistance of the SEAT BACK HEATER ELEMENT. Connect one lead to the Heated Seat Driver circuit (seat back side) and the other lead to the Driver Seat Heater Ground circuit (seat back side) in the Driver Heated Seat 2-way connector. Is the resistance below 3.0 ohms? Yes → Go To 9 No → Replace the Driver Heated Seat Back. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

DRIVER SEAT HEAT OUTPUT OPEN/SHT TO BATTERY (LAREDO) — Continued

TEST	ACTION	APPLICABILITY
9	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Disconnect the Driver Heated Seat Back 2-way (green) connector. Disconnect the Driver Heated Seat Cushion 4-way connector. Measure the resistance of the Heated Seat Driver circuit between the Driver Heated Seat Back 2-way connector (harness side) and the Driver Heated Seat Cushion 4-way connector (harness side). Is the resistance below 5.0 ohms? Yes → Go To 10 No → Repair the open Heated Seat Driver circuit. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
10	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Disconnect the Driver Heated Seat Back 2-way (green) connector. Disconnect the HSM C2 harness connector. Measure the resistance of the Driver Seat Heater Ground circuit between the Seat Back 2-way connector (harness side) and the Heated Seat Module connector. Is the resistance below 5.0 ohms? Yes → Go To 11 No → Repair the Driver Seat Heater Ground circuit for an open. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
11	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Driver Heated Seat Cushion 4-way connector. Disconnect the Heated Seat Module C2 harness connector. Measure the resistance of the Driver Seat Heater B(+) Driver circuit between the HSM C2 connector and the Driver Heated Seat Cushion 4-way connector (harness side). Is the resistance below 5.0 ohms? Yes → Test Complete. No → Repair the open Driver Seat Heater B(+) Driver circuit. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:

DRIVER SEAT HEAT OUTPUT OPEN/SHT TO BATTERY (LIMITED)

When Monitored and Set Condition:

DRIVER SEAT HEAT OUTPUT OPEN/SHT TO BATTERY (LIMITED)

When Monitored: With the ignition, during the heated seat operation.

Set Condition: This condition is set immediately after the Heated Seat Module loses the seat heat element output.

POSSIBLE CAUSES
DTC PRESENT
HEATED SEAT MODULE
DRIVER SEAT HEATER B+ DRIVER CKT SHORTED TO VOLTAGE
DRIVER HEATED SEAT CUSHION SHORTED TO VOLTAGE
DRIVER SEAT HEATER GROUND CKT (1) SHORTED TO VOLTAGE
DRIVER SEAT HEATED GROUND CKT (2) SHORTED TO VOLTAGE
CONNECTOR TO SPLICE - CUSHION SIDE - OPEN
DRIVER SEAT HEATER B(+) DRIVER CKT OPEN
DRIVER SEAT HEATER GROUND CKT (JUMPER) OPEN
DRIVER SEAT HEATER GROUND CKT (1) OPEN
DRIVER SEAT HEATER GROUND CKT (2) OPEN

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase DTCs. Start the engine. Turn the driver seat heater on and operate in both ranges. With the DRBIII®, read DTCs. Did the DRIVER SEAT HEAT OUTPUT OPEN/SHORT TO BATTERY DTC return? Yes → Go To 2 No → The conditions required to set the code are currently not present. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

DRIVER SEAT HEAT OUTPUT OPEN/SHT TO BATTERY (LIMITED) — Continued

TEST	ACTION	APPLICABILITY
2	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C2 harness connector. Measure the total resistance of the Driver Seat Heater System from the Driver Seat Heater B(+) Driver to the Driver Seat Heater Ground in the HSM C2 connector Is the resistance below 50.0 ohms? Yes → Go To 3 No → Go To 7	All
3	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C2 harness connector. Turn the ignition on. Measure the voltage of the Driver Seat Heater B(+) Driver circuit. Is ANY voltage present on the Driver Seat Heater B(+) Driver circuit? Yes → Go To 4 No → Replace the Heated Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
4	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C2 harness connector. Disconnect the Driver Heated Seat Cushion 4-way connector. Turn the ignition on. Measure the voltage of the Driver Seat Heater B(+) Driver circuit. Is there ANY voltage on the Driver Seat Heater B(+) Driver circuit? Yes → Repair the Driver Seat Heater B(+) Driver circuit for a short to voltage. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 5	All
5	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the HSM C2 harness connector. Disconnect the Driver Heated Seat Back 4-way connector. Turn the ignition on. Measure the voltage of the Driver Seat Heater Ground circuit at the HSM C2 connector. Is there ANY voltage on the Driver Seat Heater Ground circuit? Yes → Go To 6 No → Replace the Driver Heated Seat Cushion / Bolster. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

DRIVER SEAT HEAT OUTPUT OPEN/SHT TO BATTERY (LIMITED) — Continued

TEST	ACTION	APPLICABILITY
6	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the HSM C2 harness connector. Disconnect the Driver Heated Seat Cushion 4-way connector. Disconnect the Driver Heated Seat Back 2-way connector. Turn the ignition on. Measure the voltage of the Driver Seat Heater Ground circuit at the HSM C2 connector. Is there ANY voltage on the Driver Seat Heater Ground circuit? Yes → Repair the Driver Seat Heater Ground circuit for a short to voltage between the HSM C2 connector and the Driver Heated Seat Back 2-way connector. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Repair the Driver Seat Heater Ground circuit for a short to voltage between the Driver Heated Seat Back 2-way connector and the Driver Heated Seat Cushion 4-way connector. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
7	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the HSM C2 harness connector. Disconnect the Driver Heated Seat Cushion 4-way connector. Connect a jumper wire from the Driver Seat Heater B+ Driver circuit to the Driver Seat Heater Ground circuit at the Driver Heated Seat Cushion 4-way connector (harness side). Measure the resistance of the Driver Seat Heater B+ Driver circuit and the Driver Seat Heater Ground circuit in the HSM C2 connector. Is the resistance below 5.0 ohms? Yes → Repair the open circuit in either the Driver Seat Heater Ground or the Driver Seat Heater B(+) Driver wiring between the HSM C2 connector and the splice in the seat. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 8	All
8	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C2 harness connector. Disconnect the Driver Heated Seat Cushion 4-way connector. Measure the resistance of the Driver Seat Heater B(+) Driver circuit between the HSM C2 connector and the Driver Heated Seat Cushion 4-way connector (harness side). Is the resistance below 5.0 ohms? Yes → Go To 9 No → Repair the open Driver Seat Heater B(+) Driver circuit. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

DRIVER SEAT HEAT OUTPUT OPEN/SHT TO BATTERY (LIMITED) — Continued

TEST	ACTION	APPLICABILITY
9	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Disconnect the Driver Heated Seat Back 2-way (green) connector. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
10	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Driver Heated Seat Back 2-way (green) connector. Disconnect the Driver Heated Seat Cushion 4-way connector. Measure the resistance of the Driver Seat Heater Ground circuit between the 2 connectors. Is the resistance below 5.0 ohms? Yes → Go To 11 No → Repair the open Driver Seat Heater Ground circuit between the Driver Heated Seat Back 2-way connector and the Driver Heated Seat Cushion 4-way connector. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
11	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Driver Heated Seat Back 2-way (green) connector. Disconnect the HSM C2 harness connector. Measure the resistance of the Driver Seat Heater Ground circuit between the Seat Back 2-way connector (harness side) and the Heated Seat Module C2 connector. Is the resistance below 5.0 ohms? Yes → Test Complete. No → Repair the Driver Seat Heater Ground circuit for an open. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:
DRIVER SEAT HEAT OUTPUT SHORT TO GND (LIMITED)

When Monitored and Set Condition:

DRIVER SEAT HEAT OUTPUT SHORT TO GND (LIMITED)

When Monitored: With the ignition on, during the heated seat operation.

Set Condition: This condition is set immediately after the Heated Seat Module detects an output shorted to ground.

POSSIBLE CAUSES
DTC PRESENT
HEATED SEAT MODULE
DRIVER SEAT HEATER B(+) DRIVER CKT SHORTED TO DRIVER SEAT HEATER GROUND
DRIVER SEAT HEATER B(+) DRIVER CKT SHORTED TO GROUND
HEATED SEAT MODULE
DRIVER HEATED SEAT CUSHION SHORTED TO GROUND
DRIVER HEATED SEAT BACK SHORTED TO GROUND

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase DTCs. Start the engine. Turn the driver seat heater on and operate in both ranges. With the DRBIII®, read DTCs. Did the DRIVER SEAT HEAT OUTPUT SHORT TO GROUND DTC return? Yes → Go To 2 No → The conditions required to set the code are currently not present. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
2	Using the DRBIII®, select: Body - Memory Seat Module - Erase DTC's. **NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Driver Heated Seat Cushion 4-way connector. Turn the ignition on. Turn the driver heated seat on. With the DRBIII®, read DTC's. Does the DRBIII® still show Driver Seat Heat Output Short to Gnd? Yes → Go To 3 No → Go To 5	All

DRIVER SEAT HEAT OUTPUT SHORT TO GND (LIMITED) — Continued

TEST	ACTION	APPLICABILITY
3	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C2 harness connector. Disconnect the Driver Heated Seat Cushion 4-way connector. Measure the resistance of the Driver Seat Heater B(+) Driver circuit to the Driver Seat Heater Ground circuit in the HSM C2 connector. Is the resistance below 1000.0 ohms? Yes → Repair the Driver Seat Heater B(+) Driver circuit for a short to the Driver Seat Heater Ground circuit. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 4	All
4	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C2 harness connector. Disconnect the Driver Heated Seat Cushion 4-way connector. Measure the resistance of the Driver Seat Heater B(+) Driver circuit to ground. Is the resistance below 5.0 ohms? Yes → Repair the Driver Seat Heater B(+) Driver circuit for a short to ground. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Replace the Heated Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
5	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Driver Heated Seat Cushion 4-way connector. Measure the resistance of the Driver Seat Heater B(+) Driver circuit in the Driver Heated Seat Cushion connector (cushion side) to ground. Is the resistance below 100.0 ohms? Yes → Go To 6 No → Replace the Heated Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
6	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Driver Heated Seat Cushion 4-way connector. Disconnect the Driver Heated Seat Back 2-way (black) connector. Measure the resistance of the Driver Seat Heater B(+) Driver circuit in the Driver Heated Seat Cushion connector (cushion side) to ground. Is the resistance below 1000.0 ohms? Yes → Replace the Driver Heated Seat Cushion. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Replace the Driver Heated Seat Back. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:
DRIVER SEAT HEAT OUTPUT SHORT TO GROUND (LAREDO)

When Monitored and Set Condition:

DRIVER SEAT HEAT OUTPUT SHORT TO GROUND (LAREDO)

When Monitored: With the ignition on, during the heated seat operation.

Set Condition: This condition is set immediately after the Heated Seat Module detects an output shorted to ground.

POSSIBLE CAUSES
DTC PRESENT
DRIVER SEAT HEATER B(+) DRIVER CKT SHORTED TO DRIVER SEAT HEATER GROUND
DRIVER SEAT HEATER B(+) DRIVER CKT SHORTED TO GROUND
DRIVER SEAT CUSHION SHORTED TO GROUND
HEATED SEAT MODULE

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase DTCs. Start the engine. Turn the driver seat heater on and operate in both ranges. With the DRBIII®, read DTCs. Did the DRIVER SEAT HEAT OUTPUT SHORT TO GROUND DTC return? Yes → Go To 2 No → The conditions required to set the code are currently not present. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
2	**NOTE: Raise the seat to the highest position to gain access to the connectors. Disconnect the Driver Heated Seat Cushion 4-way connector. Start the engine. Turn the driver seat heater on and operate at both ranges. With the DRBIII®, read DTC's. Does the DRBIII® still show Driver Seat Heat Output Short to Gnd? Yes → Go To 3 No → Go To 5	All

DRIVER SEAT HEAT OUTPUT SHORT TO GROUND (LAREDO) — Continued

TEST	ACTION	APPLICABILITY
3	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C2 harness connector. Disconnect the Driver Heated Seat Cushion 4-way connector. Measure the resistance of the Driver Seat Heater B(+) Driver circuit to the Driver Seat Heater Ground circuit in the HSM C2 connector. Is the resistance below 1000.0 ohms? Yes → Repair the Driver Seat Heater B(+) Driver circuit for a short to the Driver Seat Heater Ground circuit. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 4	All
4	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C2 harness connector. Disconnect the Driver Heated Seat Cushion 4-way connector. Measure the resistance of the Driver Seat Heater B(+) Driver circuit to ground. Is the resistance below 5.0 ohms? Yes → Repair the Driver Seat Heater B(+) Driver circuit for a short to ground. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Replace the Heated Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
5	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition on. Disconnect the Driver Heated Seat Cushion 4-way connector. Measure the resistance of the Driver Seat Cushion connector (cushion side) to ground. Is the resistance below 100.0 ohms? Yes → Replace the Driver Heater Cushion. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Test Complete.	All

Symptom:
DRIVER THERMISTOR OUT OF RANGE HIGH

When Monitored and Set Condition:

DRIVER THERMISTOR OUT OF RANGE HIGH

When Monitored: With the ignition on, during the heated seat operation.

Set Condition: This condition is immediately set when the Heated Seat Module senses a greater value than the value stored in EEPROM.

POSSIBLE CAUSES
DRIVER HEATED SEAT SENSOR SHORTED
DRIVER SEAT TEMPERATURE SENSOR INPUT CIRCUIT SHORTED TO BATTERY
DRIVER SEAT TEMPERATURE SENSOR INPUT CIRCUIT SHORTED TO 5 VOLT SUPPLY
SEAT SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
HEATED SEAT MODULE - SENSOR SHORTED

TEST	ACTION	APPLICABILITY
1	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Driver Heated Seat Cushion 4-way connector. Measure the resistance between the Seat Sensor 5 Volt Supply circuit and the Driver Seat Temperature Sensor Input circuit at the driver heated seat cushion (cushion side) connector. Is the resistance below 800 ohms at room temperature? Yes → Replace the Driver Heated Seat Cushion Cover - sensor shorted.. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 2	All
2	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C1 harness connector. Disconnect the Driver Heated Seat Cushion 4-way connector. Turn the ignition on. Measure the voltage between the Driver Seat Temperature Sensor Input circuit and ground. Is the voltage above 5.5 volts? Yes → Repair the Driver Seat Temperature Sensor Input circuit for a short to battery. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 3	All

DRIVER THERMISTOR OUT OF RANGE HIGH — Continued

TEST	ACTION	APPLICABILITY
3	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C1 harness connector. Disconnect the Driver Heated Seat Cushion 4-way connector. Turn the ignition on. Measure the voltage between the Driver Seat Temperature Sensor Input circuit and ground. Is there ANY voltage on the Driver Seat Temperature Sensor Input circuit? Yes → Repair the Driver Seat Temperature Sensor Input circuit for a short to 5 volt supply. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 4	All
4	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C1 harness connector. Disconnect the Driver Heated Seat Cushion 4-way connector. Turn the ignition on. Measure the resistance of the Seat Sensor 5 Volt Supply circuit to ground. Is the resistance below 1000.0 ohms? Yes → Repair the Seat Sensor 5 Volt Supply circuit for a short to ground. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Replace the Heated Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:
DRIVER THERMISTOR OUT OF RANGE LOW

When Monitored and Set Condition:

DRIVER THERMISTOR OUT OF RANGE LOW

When Monitored: With the ignition on, during the heated seat operation.

Set Condition: This condition is immediately set when the Heated Seat Module senses a lesser value than the value stored in EEPROM.

POSSIBLE CAUSES
DRIVER HEATED SEAT CUSHION SENSOR OPEN
DRIVER SEAT TEMPERATURE SENSOR INPUT CKT SHORTED TO GROUND
DRIVER HEATED SEAT CUSHION FAILED SENSOR
DRIVER SEAT TEMPERATURE SENSOR INPUT CKT OPEN
SEAT SENSOR 5-VOLT SUPPLY CKT OPEN
HEATED SEAT MODULE
HEATED SEAT MODULE - 5 VOLT SUPPLY OPEN

TEST	ACTION	APPLICABILITY
1	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Driver Heated Seat Cushion 4-way connector. Turn the ignition on. Measure the voltage between the Seat Sensor 5 Volt Supply circuit and ground. Is the voltage below 4.5 volts? Yes → Go To 2 No → Go To 3	All
2	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C1 connector. Disconnect the Driver Heated Seat Cushion 4-way connector. Measure the resistance of the Seat Sensor 5 Volt Supply circuit between the Heated Seat Module connector and the Driver Heated Seat Cushion (harness side) connector. Is the resistance below 5.0 ohms? Yes → Replace the Heated Seat Module - 5 volt supply open. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Repair the open Seat Sensor 5 Volt Supply circuit. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

DRIVER THERMISTOR OUT OF RANGE LOW — Continued

TEST	ACTION	APPLICABILITY
3	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Driver Heated Seat Cushion 4-way connector. Measure the resistance between the Seat Sensor 5 Volt Supply circuit and the Driver Seat Temperature Sensor Input circuit at the driver heated seat cushion (cushion side) connector. Is the resistance above 70,000 (70K) ohms at room temperature? Yes → Replace the Driver Heated Seat Cushion. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 4	All
4	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C1 harness connector. Disconnect the Driver Heated Seat Cushion 4-way connector. Measure the resistance of the Driver Seat Temperature Sensor Input circuit (harness side) and ground. Is the resistance below 1,000.0 ohms? Yes → Repair the Driver Seat Temperature Sensor Input circuit for a short to ground. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 5	All
5	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Driver Heated Seat Cushion 4-way connector. Measure the resistance between the Driver Seat Temp Sensor Input circuit (cushion side) and ground. Is the resistance below 1000.0 ohms? Yes → Replace the Driver Heated Seat Cushion. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 6	All
6	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C1 connector. Disconnect the Driver Heated Seat Cushion 4-way connector. Measure the resistance of the Driver Seat Temperature Sensor Input circuit from the Heated Seat Module connector to the Driver Heated Seat Cushion connector. Is the resistance below 5.0 ohms? Yes → Replace the Heated Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Repair the open Driver Seat Temperature Sensor Input circuit. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:
PASSENGER SEAT HEAT OUTPUT OPEN/SHT TO BATTERY (LAREDO)

When Monitored and Set Condition:

PASSENGER SEAT HEAT OUTPUT OPEN/SHT TO BATTERY (LAREDO)

When Monitored: With the ignition on, during the heated seat operation.

Set Condition: This condition is set immediately after the Heated Seat Module loses the seat heat element output.

POSSIBLE CAUSES
DTC PRESENT
PASSENGER SEAT HEATER SYSTEM SHORTED TO VOLTAGE
PASSENGER SEAT HEATER B(+) DRIVER CKT SHORTED TO VOLTAGE
PASSENGER HEATED SEAT CUSHION SHORTED TO VOLTAGE
PASSENGER SEAT HEATER GROUND CKT SHORTED TO VOLTAGE
HEATED SEAT DRIVER CKT SHORTED TO VOLTAGE
PASSENGER HEATED SEAT CUSHION OPEN
PASSENGER SEAT BACK HEATER OPEN
HEATED SEAT DRIVER CKT OPEN
PASSENGER SEAT HEATER GROUND CKT OPEN
PASSENGER SEAT HEATER B(+) DRIVER CKT OPEN

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase DTCs. Start the engine. Turn the passenger seat heater on and operate in both ranges. With the DRBIII®, read DTCs. Did the PASSENGER SEAT HEAT OUTPUT OPEN/SHORT TO BATTERY DTC return? Yes → Go To 2 No → The conditions required to set the code are currently not present. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

PASSENGER SEAT HEAT OUTPUT OPEN/SHT TO BATTERY (LAREDO) — Continued

TEST	ACTION	APPLICABILITY
2	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C2 harness connector. Measure the total resistance of the Passenger Seat Heater System between the Passenger Seat Heater B(+) Driver and the Passenger Seat Heater Ground circuits in the HSM C2 connector. Is the resistance below 50.0 ohms? Yes → Go To 3 No → Go To 7	All
3	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C2 harness connector. Turn the ignition on. Measure the voltage of the Passenger Seat Heater B(+) Driver circuit. Is ANY voltage present on the Passenger Seat Heater B(+) Driver circuit? Yes → Go To 4 No → Replace the Heated Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
4	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C2 harness connector. Disconnect the Passenger Heated Seat Cushion 4-way connector. Turn the ignition on. Measure the voltage of the Passenger Seat Heater B(+) Driver circuit. Is there ANY voltage on the Passenger Seat Heater B(+) Driver circuit? Yes → Repair the Passenger Seat Heater B(+) Driver circuit for a short to voltage. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 5	All
5	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C2 harness connector. Disconnect the Passenger Heated Seat Back 4-way connector. Turn the ignition on. Measure the voltage of the Passenger Seat Heater Ground circuit. Is there ANY voltage on the Passenger Seat Heater Ground circuit? Yes → Go To 6 No → Replace the Passenger Heated Seat Cushion / Bolster. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

PASSENGER SEAT HEAT OUTPUT OPEN/SHT TO BATTERY (LAREDO) — Continued

TEST	ACTION	APPLICABILITY
6	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C2 harness connector. Disconnect the Passenger Heated Seat Back 2-way (green) connector. Disconnect the Passenger Heated Seat Cushion 4-way connector. Turn the ignition on. Measure the voltage of the Passenger Seat Heater Ground circuit. Is there ANY voltage on the Passenger Seat Heater Ground circuit? Yes → Repair the Passenger Seat Heater Ground circuit for a short to voltage. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Repair the Heated Seat Driver circuit for a short to voltage. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
7	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Disconnect the Passenger Heated Seat Cushion 4-way connector. Measure the resistance of the CUSHION SEAT HEATER ELEMENT. Connect one lead to the Heated Seat Driver circuit (cushion side) and the other lead to the Passenger Seat Heater B(+) Driver circuit (cushion side) in the Passenger Heated Seat Cushion 4 way connector. Is the resistance below 2.0 ohms? Yes → Go To 8 No → Replace the Passenger Heated Seat Cushion / Bolster. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
8	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Disconnect the Passenger Heated Seat Back 2-way (green) connector. Measure the resistance of the SEAT BACK HEATER ELEMENT. Connect one lead to the Heated Seat Driver circuit (seat back side) and the other lead to the Passenger Seat Heater Ground circuit (seat back side) in the Passenger Heated Seat 2-way connector. Is the resistance below 2.0 ohms? Yes → Go To 9 No → Replace the Passenger Heated Seat Back. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

PASSENGER SEAT HEAT OUTPUT OPEN/SHT TO BATTERY (LAREDO) — Continued

5	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Passenger Heated Seat Cushion 4-way connector. Measure the resistance of the Passenger Seat Heater B(+) Driver circuit in the Passenger Heated Seat Cushion connector (cushion side) to ground. Is the resistance below 100.0 ohms? Yes → Go To 6 No → Replace the Heated Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
6	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Passenger Heated Seat Cushion 4-way connector. Disconnect the Passenger Heated Seat Back 2-way (black) connector. Measure the resistance of the Passenger Seat Heater B(+) Driver circuit in the Passenger Heated Seat Cushion connector (cushion side) to ground. Is the resistance below 1000.0 ohms? Yes → Replace the Passenger Heated Seat Cushion. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Replace the Passenger Heated Seat Back. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:
PASSENGER THERMISTOR OUT OF RANGE HIGH

When Monitored and Set Condition:

PASSENGER THERMISTOR OUT OF RANGE HIGH

When Monitored: With the ignition on, during the heated seat operation.

Set Condition: This condition is immediately set when the Heated Seat Module senses a greater value than the value stored in EEPROM.

POSSIBLE CAUSES
PASSENGER SEAT SENSOR SHORTED
PASSENGER SEAT TEMPERATURE SENSOR INPUT CIRCUIT SHORTED TO BATTERY
PASSENGER SEAT TEMPERATURE SENSOR INPUT CKT SHORTED TO 5 VOLTS
HEATED SEAT MODULE - SENSOR SHORTED
SEAT SENSOR 5-VOLT SUPPLY CKT SHORTED TO GROUND

TEST	ACTION	APPLICABILITY
1	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Passenger Heated Seat Cushion 4-way connector. Measure the resistance between the Seat Sensor 5 Volt Supply circuit and the Passenger Seat Temperature Sensor Input circuit at the Passenger Heated Seat Cushion (cushion side) connector. Is the resistance below 800 ohms at room temperature? Yes → Replace the Passenger Heated Seat Cushion - sensor shorted.. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 2	All
2	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C1 harness connector. Disconnect the Passenger Heated Seat Cushion 4-way connector. Turn the ignition on. Measure the voltage between the Passenger Seat Temperature Sensor Input circuit and ground. Is the voltage above 5.5 volts? Yes → Repair the Passenger Seat Temperature Sensor Input circuit for a short to battery. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 3	All

PASSENGER THERMISTOR OUT OF RANGE HIGH — Continued

TEST	ACTION	APPLICABILITY
3	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C1 harness connector. Disconnect the Passenger Heated Seat Cushion 4-way connector. Turn the ignition on. Measure the voltage between the Passenger Seat Temperature Sensor Input circuit and ground. Is there ANY voltage on the Passenger Seat Temperature Sensor Input circuit? Yes → Repair the Passenger Seat Temperature Sensor Input circuit for a short to voltage. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 4	All
4	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C1 connector. Disconnect the Passenger Heated Seat Cushion 4-way (green) connector. Measure the resistance of the Seat Sensor 5 Volt Supply circuit to ground. Is the resistance below 1000.0 ohms? Yes → Repair the open Seat Sensor 5-Volt Supply circuit. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Replace the Heated Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:
PASSENGER THERMISTOR OUT OF RANGE LOW

When Monitored and Set Condition:

PASSENGER THERMISTOR OUT OF RANGE LOW

When Monitored: With the ignition on, during the heated seat operation.

Set Condition: This condition is immediately set when the Heated Seat Module senses a lesser value than the value stored in EEPROM.

POSSIBLE CAUSES
PASSENGER HEATED SEAT CUSHION SENSOR OPEN
PASSENGER SEAT TEMPERATURE SENSOR INPUT CKT SHORTED TO GROUND
PASSENGER HEATED SEAT CUSHION SENSOR SHORT TO GROUND
PASSENGER SEAT TEMPERATURE SENSOR INPUT CKT OPEN
HEATED SEAT MODULE
SEAT SENSOR 5-VOLT SUPPLY CKT OPEN
HEATED SEAT MODULE-5 VOLTS OPEN

TEST	ACTION	APPLICABILITY
1	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Passenger Heated Seat Cushion 4-way connector. Turn the ignition on. Measure the voltage between the Seat Sensor 5 Volt Supply circuit and ground. Is the voltage below 4.5 volts? Yes → Go To 2 No → Go To 3	All
2	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C1 connector. Disconnect the Passenger Heated Seat Cushion 4-way connector. Measure the resistance of the Seat Sensor 5 Volt Supply circuit between the Heated Seat Module connector and the Passenger Heated Seat Cushion (harness side) connector. Is the resistance below 5.0 ohms? Yes → Replace the Heated Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Repair the open Seat Sensor 5 Volt Supply circuit. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

PASSENGER THERMISTOR OUT OF RANGE LOW — Continued

TEST	ACTION	APPLICABILITY
3	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Passenger Heated Seat Cushion 4-way connector. Measure the resistance between the Seat Sensor 5 Volt Supply circuit and the Passenger Seat Temperature Sensor Input circuit at the Passenger Heated Seat Cushion (cushion side) connector. Is the resistance above 70,000 (70K) ohms at room temperature? Yes → Replace the Passenger Heated Seat Cushion. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 4	All
4	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C1 harness connector. Disconnect the Passenger Heated Seat Cushion 4-way connector. Measure the resistance of the Passenger Seat Temperature Sensor Input circuit to ground. Is the resistance below 1,000.0 ohms? Yes → Repair the Passenger Seat Temperature Sensor Input circuit for a short to ground. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 5	All
5	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Passenger Heated Seat Cushion 4-way connector. Measure the resistance between the Passenger Seat Temp Sensor Input circuit and ground. Is the resistance below 1000.0 ohms? Yes → Replace the Passenger Seat Cushion Cover Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 6	All
6	**NOTE: Raise the seat to the highest position to gain access to the connectors. The HSM is located at the front of the seat and the Seat Heater connectors are at the rear of the seat.** Turn the ignition off. Disconnect the Heated Seat Module C1 connector. Disconnect the Passenger Heated Seat Cushion 4-way connector. Measure the resistance of the Passenger Seat Temperature Sensor Input circuit from the Heated Seat Module connector to the Passenger Heated Seat Cushion connector. Is the resistance below 5.0 ohms? Yes → Replace the Heated Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Repair the open Passenger Seat Temperature Sensor Input circuit. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:
REAR DEF RELAY SHORTED HI

When Monitored and Set Condition:

REAR DEF RELAY SHORTED HI

When Monitored: With the ignition key in the run position.

Set Condition: The BCM attempts to activate the rear defogger relay and senses excessive current on the circuit.

POSSIBLE CAUSES
REAR DEFOGGER RELAY
JUNCTION BLOCK
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Lower the Junction Block and remove the Rear Window Defogger Relay. Connect a test light between cavities 85 & 86 of the Rear Window Defogger Relay connector. Turn the ignition on. With the DRBIII®, actuate the R Defog Relay and observe the test light. Does the test light flash on and off when the relay is actuated? Yes → Replace the Rear Window Defogger Relay. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 2	All
2	Turn the ignition off. Lower the Junction Block and remove the Rear Window Defogger Relay. Disconnect and remove the Body Control Module. Turn the ignition on. Measure the voltage at cavities 85 & 86 of the Relay connector. Is the voltage above 1.0 volts at BOTH cavities? (Note: there should only be voltage on one cavity) Yes → Replace the Junction Block. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Replace the Body Control Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:
REAR DEFOGGER RELAY OPEN

When Monitored and Set Condition:

REAR DEFOGGER RELAY OPEN

When Monitored: With the ignition in the run position.

Set Condition: The rear defogger relay output of the BCM does not have battery voltage.

POSSIBLE CAUSES
FUSED B(+) CKT SHORTED TO GROUND
REAR DEFOGGER RELAY OUTPUT CKT SHORTED TO GROUND
PDC FUSE #2 OPEN
FUSED B(+) CKT OPEN
REAR WINDOW DEFOGGER RELAY
REAR WINDOW DEFOGGER RELAY CONTROL SHORT TO GROUND.
JUNCTION BLOCK
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Remove and inspect the PDC fuse #2. Is the PDC fuse #2 open? Yes → Go To 2 No → Go To 4	All
2	Turn the ignition off. Lower the Junction Block and remove the Rear Window Defogger Relay. Measure the resistance of the Fused B(+) circuits in the Rear Window Defogger Relay connector to ground. Is the resistance below 5.0 ohms? Yes → Repair the Fused B(+) circuit for a short to ground. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 3	All

REAR DEFOGGER RELAY OPEN — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Rear Window Defogger connector at the rear window Grid. Remove the Rear Window Defogger Relay from the Junction Block. Measure the resistance between ground and the Rear Window Defogger Relay Output circuit at the Rear Window Defogger connector. Is the resistance below 5.0 ohms? Yes → Repair the Rear Window Defogger Relay Output circuit for a short to ground. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Replace PDC fuse #2. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
4	Turn the ignition off. Lower the Junction Block and remove the Rear Window Defogger Relay. Turn the ignition on. Measure the voltage of the Fused B(+) circuit in the Rear Window Defogger Relay connector. Is the voltage above 10.0 volts? Yes → Go To 5 No → Repair the open Fused B(+) circuit from PDC fuse #2. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
5	Turn the ignition off. Lower the Junction Block and remove the Rear Window Defogger Relay. Connect a test light between cavities 85 & 86 of the Rear Window Defogger Relay connector. Turn the ignition on. With the DRBIII®, actuate the R Defog Relay and observe the test light. Does the test light flash on and off when the relay is actuated? Yes → Replace the Rear Window Defogger Relay. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 6	All
6	Turn the ignition off. Lower the Junction Block and remove the Rear Window Defogger Relay. Disconnect and remove the Body Control Module. Measure the resistance of the Rear Window Defogger Relay Control circuit to ground. Is the resistance below 1000.0 ohms? Yes → Replace the Junction Block. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 7	All
7	Turn the ignition off. Lower the Junction Block and remove the Rear Window Defogger Relay. Disconnect and remove the Body Control Module. Measure the resistance of the Rear Window Defogger Relay Control circuit between the relay connector and the J/B-BCM connector in the Junction Block. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Replace the Junction Block. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:
*DRIVER SEAT BACK HEATER INOPERATIVE (LIMITED)

POSSIBLE CAUSES
DRIVER SEAT BACK HEATER OPEN (LIMITED)
INTERMITTENT CONDITION

TEST	ACTION	APPLICABILITY
1	**NOTE: This test is only valid on Limited models where the Seat Cushion heats properly but the Seat Back does not heat.** Start the Engine. Turn the Heated Seat Switch on. Does the Seat Cushion warm up but the Seat Back does not? Yes → Check for an open circuit in the Seat Back. If okay, replace the Heated Seat Back. Perform VERIFICATION TEST -MEMORY SYSTEM. No → The condition that caused this symptom is currently not present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced, pinched or partially broken wires. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:
*DRIVER SEAT BOLSTER HEATER INOPERATIVE (LIMITED)

POSSIBLE CAUSES
DRIVER HEATED SEAT BOLSTER OPEN (LIMITED)
INTERMITTENT CONDITION

TEST	ACTION	APPLICABILITY
1	**NOTE: This test is only valid on Limited models where the Seat Back and Seat Cushion heats properly but the Seat Bolsters do not.** Start the Engine. Turn the Heated Seat Switch on. Does the Seat Back and Seat Cushion warm up but the Seat Bolsters do not? Yes → Check for an open circuit in the Seat. If okay, replace the Heated Seat Cushion Cover. Perform VERIFICATION TEST -MEMORY SYSTEM. No → The condition that caused this symptom is currently not present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced, pinched or partially broken wires. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:
*DRIVER SEAT CUSHION HEATER INOPERATIVE (LIMITED)

POSSIBLE CAUSES
DRIVER HEATED SEAT CUSHION OPEN (LIMITED)
INTERMITTENT CONDITION

TEST	ACTION	APPLICABILITY
1	**NOTE: This test is only valid on Limited models where the Seat Back heats properly but the Seat Cushion does not heat.** Start the Engine. Turn the Heated Seat Switch on. Does the Seat Back warm up but the Seat Cushion does not? Yes → Check for an open circuit in the Seat. If okay, replace the Heated Seat Cushion. Perform VERIFICATION TEST -MEMORY SYSTEM. No → The condition that caused this symptom is currently not present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced, pinched or partially broken wires. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:
*HEATED SEATS INOPERATIVE DUE TO KEY-IN IGNITION SWITCH INPUT

POSSIBLE CAUSES
OBSERVE THE KEY-IN IGNITION SWITCH STATUS
IGNITION SWITCH OPEN
KEY-IN IGNITION SWITCH GROUND CIRCUIT OPEN
KEY-IN IGNITION SWITCH SENSE CIRCUIT OPEN
BCM-INCORRECT KEY-IN IGNITION SWITCH STATUS

TEST	ACTION	APPLICABILITY
1	**Note: Ensure that the Key is still in the Ignition Switch.** With the DRBIII® enter Body Computer then Input Output and read the Key-In Ignition Switch status. Does the DRB display: KEY-IN IGN: CLOSED ? Yes → Test complete. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 2	All
2	Turn the ignition off. Disconnect the Ignition Switch harness connector. Connect a jumper between the Key-In Ignition Switch Sense circuit and Ground circuit. With the DRBIII® enter Body Computer then Input Output and observe the Key-In Ignition Switch status. Does the DRBIII display KEY-IN IGN: CLOSED? Yes → Replace the Ignition Switch. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 3	All
3	Turn the ignition off. Disconnect the Ignition Switch harness connector. Turn all lights off. Measure the resistance between ground and the ground circuit in the ignition switch connector. Is the resistance below 5.0 ohms ? Yes → Go To 4 No → Repair the ground circuit for an open. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

*HEATED SEATS INOPERATIVE DUE TO KEY-IN IGNITION SWITCH INPUT — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the Ignition Switch harness connector. Disconnect the Body Control Module C1 harness connector. Measure the resistance of the Key-In Ignition Switch Sense circuit between the ignition switch connector and the BCM C1 connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Key-In Ignition Switch Sense circuit for an open. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
5	If there are no possible causes remaining, view repair. Repair Replace and program the Body Control Module in accordance with the Service Information. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:
*PASSENGER SEAT BACK HEATER INOPERATIVE (LIMITED)

POSSIBLE CAUSES
PASSENGER HEATED SEAT BACK OPEN (LIMITED)
INTERMITTENT CONDITION

TEST	ACTION	APPLICABILITY
1	**NOTE: This test is only valid on Limited models where the Seat Cushion heats properly but the Seat Back does not heat.** Start the Engine. Turn the Heated Seat Switch on. Does the Seat Cushion warm up but the Seat Back does not? Yes → Check for an open circuit in the Seat. If okay, replace the Heated Seat Back. Perform VERIFICATION TEST -MEMORY SYSTEM. No → The condition that caused this symptom is currently not present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced, pinched or partially broken wires. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:
*PASSENGER SEAT BOLSTER HEATER INOPERATIVE (LIMITED)

POSSIBLE CAUSES
PASSENGER HEATED SEAT BOLSTER OPEN (LIMITED)
INTERMITTENT CONDITION

TEST	ACTION	APPLICABILITY
1	**NOTE: This test is only valid on Limited models where the Seat Back and Seat Cushion heats properly but the e Bolster does not.** Start the Engine. Turn the Heated Seat Switch on. Does the Seat Back and Seat Cushion warm up but the Seat Bolster does not? Yes → Check for an open circuit in the Seat. If okay, replace the Heated Seat Cushion Cover. Perform VERIFICATION TEST -MEMORY SYSTEM. No → The condition that caused this symptom is currently not present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced, pinched or partially broken wires. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:
*PASSENGER SEAT CUSHION HEATER INOPERATIVE (LIMITED)

POSSIBLE CAUSES
PASSENGER HEATED SEAT CUSHION OPEN (LIMITED)
INTERMITTENT CONDITION

TEST	ACTION	APPLICABILITY
1	**NOTE: This test is only valid on Limited models where the Seat Back heats properly but the Seat Cushion does not heat.** Start the Engine. Turn the Heated Seat Switch on. Does the Seat Back warm up but the Seat Cushion does not? Yes → Check for an open circuit in the Seat. If okay, replace the Heated Seat Cushion. Perform VERIFICATION TEST -MEMORY SYSTEM. No → The condition that caused this symptom is currently not present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced, pinched or partially broken wires. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:
*REAR WINDOW DEFOGGER GRID INOPERATIVE

POSSIBLE CAUSES
REAR DEFOGGER RELAY DTC'S
INTERMITTENT CONDITION
REAR WINDOW DEFOGGER GROUND CKT
REAR WINDOW DEFOGGER GRID OPEN
REAR WINDOW DEFOGGER RELAY OUTPUT OPEN
REAR WINDOW DEFOGGER RELAY
REAR WINDOW DEFOGGER RELAY OUTPUT SHORTED TO GROUND
REPLACE FAULTY FUSE
FUSED B(+) CKT OPEN AT RELAY
SUBSTITUTE RELAY
JUNCTION BLOCK
REAR WINDOW DEFOGGER SWITCH SENSE CKT OPEN
REAR WINDOW DEFOGGER SWITCH SENSE CKT SHORTED TO GROUND
REAR WINDOW DEFOGGER SWITCH SENSE CKT SHORTED TO VOLTAGE
AUTOMATIC ZONE CONTROL MODULE
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, read the Body Computer DTC's. Are there any Rear Defogger Relay DTC's present? Yes → Refer to the symptom list for problems related to Rear Defogger Relay DTC's. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Toggle the Rear Defogger switch and observe the indicator. Does the indicator toggle on and off when the switch is pressed? Yes → Go To 3 No → Go To 5	All
3	Turn the ignition and all lights off. Open the liftgate. Measure the resistance between ground and the Rear Window Defogger Ground circuit. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open Rear Window Defogger Ground circuit. Perform BODY VERIFICATION TEST - VER 1.	All

*REAR WINDOW DEFOGGER GRID INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition on. Turn the Rear Window Defogger on. Measure the voltage between the Rear Window Defogger Relay Output circuit at the defogger grid on the rear window to ground. Is the voltage above 12.0 volts? Yes → Repair the open in the Rear Window Defogger Grid. Perform BODY VERIFICATION TEST - VER 1. No → Repair the open Rear Window Defogger Relay Output circuit. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn the ignition on. With the DRBIII®, read the R DEFOG SWITCH Input/Output display. Toggle the Rear Window Defogger Switch on and off and observe the DRB. Does the DRBIII® show that the Rear Defog Switch is toggling on and off? Yes → Go To 6 No → Go To 12	All
6	Remove and inspect the PDC fuse #2. Is the PDC fuse #2 open? Yes → Go To 7 No → Go To 9	All
7	Remove the Rear Window Defogger Relay from the Junction Block. Measure the resistance of the Rear Window Defogger Relay coil in cavities 85 and 86. Is the resistance between 50.0 and 100.0 ohms? Yes → Go To 8 No → Replace the Rear Window Defogger Relay and replace PDC fuse #2 if necessary. Perform BODY VERIFICATION TEST - VER 1.	All
8	Disconnect the Rear Window Defogger connector at the rear window grid. Remove the Rear Window Defogger Relay from the Junction Block. Measure the resistance between ground and the Rear Window Defogger Relay Output circuit at the Rear Window Defogger connector. Is the resistance below 5.0 ohms? Yes → Repair the Rear Window Defogger Relay Output circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the PDC fuse #2. Perform BODY VERIFICATION TEST - VER 1.	All
9	Lower the Junction Block and remove the Rear Window Defogger Relay. Turn the ignition on. Measure the voltage of the Fused B(+) circuit in the Rear Window Defogger Relay connector. Is the voltage above 10.0 volts? Yes → Go To 10 No → Repair the open Fused B(+) circuit from PDC fuse #2. Perform BODY VERIFICATION TEST - VER 1.	All

*REAR WINDOW DEFOGGER GRID INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
10	Lower the Junction Block and remove the Rear Window Defogger Relay. Install a known good relay in the Rear Window Defogger Relay connector. Turn the ignition on. Check the Rear Window Defogger for proper operation. Does the system operate properly now? Yes → Replace the original Rear Window Defogger Relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 11	All
11	With the DRBIII®, actuate the R DEFOG RELAY. Using a 12-volt Test Light connected to ground, back probe the Rear Window Defogger Relay Output circuit in the Junction Block C1 connected. Does the test light flash on and off when the relay is actuated? Yes → The condition that caused this symptom is currently not present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced, pinched or partially broken wires. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.	All
12	Turn the ignition off. Disconnect the BCM C2 connector. Disconnect the Temperature Control C1 connector. **NOTE: Check connectors - Clean/repair as necessary.** Measure the resistance of the Rear Window Defogger Switch Sense circuit between the BCM connector and the AZC connector. Is the resistance below 5.0 ohms? Yes → Go To 13 No → Repair the open Rear Window Defogger Switch Sense circuit. Perform BODY VERIFICATION TEST - VER 1.	All
13	Turn the ignition off. Disconnect the BCM C2 connector. Disconnect the Temperature Control C1 connector. Measure the resistance between ground and the Rear Window Defogger Switch Sense circuit. Is the resistance below 5.0 ohms? Yes → Repair the Rear Window Defogger Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 14	All

*REAR WINDOW DEFOGGER GRID INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
14	Turn the ignition off. Disconnect the BCM C2 connector. Disconnect the Temperature Control C1 connector. **NOTE: Check connectors - Clean/repair as necessary.** Turn the ignition on. Measure the voltage between the Rear Window Defogger Switch Sense circuit and ground. Is there any voltage present? Yes → Repair the Rear Window Switch Sense circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Go To 15	All
15	**NOTE: Ensure the BCM is connected before proceeding.** Turn the ignition off. Disconnect the Temperature Control C1 connector. Connect a jumper wire between the Rear Window Defogger Switch Sense circuit in the Temperature Control connector to ground. Turn the ignition on. With the DRBIII®, read the R DEFOG SWITCH status. Does the DRBIII® display R DEFOG SWITCH: CLOSED? Yes → Replace the Automatic Zone Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*REAR WINDOW DEFOGGER SWITCH INDICATOR INOPERATIVE

POSSIBLE CAUSES
FUSED REAR WINDOW DEFOGGER RELAY OUTPUT CKT SHORTED TO GROUND
JUNCTION BLOCK FUSE #11
FUSED REAR WINDOW DEFOGGER RELAY OUTPUT CKT OPEN
TEMPERATURE CONTROL HEAD (AZC OR MANUAL)

TEST	ACTION	APPLICABILITY
1	Inspect Junction Block fuse #11. Is Junction Block fuse #11 open? Yes → Go To 2 No → Go To 3	All
2	Turn the ignition off. Disconnect the Temperature Control Head C1 connector. Measure the resistance of the Fused Rear Window Defog Relay Output circuit to ground (from the output side of fuse #11) Is the resistance below 5.0 ohms? Yes → Repair the Fused Rear Window Defogger Relay Output circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Junction Block fuse #11. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Disconnect the Temperature Control Head C1 connector. Remove the Rear Window Defogger Relay. **NOTE: Check connectors - Clean/repair as necessary.** Ensure that Junction Block fuse #11 is installed. Measure the resistance of the Fused rear Window Defogger Relay Output circuit from the relay output terminal to the Temperature Control Head C1 connector. Is the resistance below 5.0 ohms? Yes → Replace the Temperature Control Head (AZC or manual). Perform BODY VERIFICATION TEST - VER 1. No → Repair the open Fused Rear Window Defogger Relay Output circuit. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
FOG LAMP RELAY CKT SHORTED HI

When Monitored and Set Condition:

FOG LAMP RELAY CKT SHORTED HI

When Monitored: Ignition in run position.

Set Condition: The BCM detects excessive current on the fog lamp relay control circuit.

POSSIBLE CAUSES
FOG LAMP RELAY
FOG LAMP RELAY CONTROL SH TO B(+)
BCM INTERNAL DEFECT FOG LAMP CONTROL SHORT TO BATTERY

TEST	ACTION	APPLICABILITY
1	Install a known good relay in place of the Fog Lamp Relay. Does the system operate correctly? Yes → Replace the Fog Lamp Relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Remove the Fog Lamp Relay from the Junction Block. Turn ignition off. Remove the Body Control Module from the Junction Block. Turn ignition on. Measure voltage of the Fog Lamp Relay control circuit at the Junction Block to ground. Is the voltage greater than 1.0 volt? Yes → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
FOG LAMP RELAY CKT SHORTED LO/OPEN

When Monitored and Set Condition:

FOG LAMP RELAY CKT SHORTED LO/OPEN

When Monitored: With the ignition switch in the on position.

Set Condition: This DTC sets if no voltage is seen at the fog lamp relay control circuit cavity.

POSSIBLE CAUSES
FOG LAMP RELAY COIL SHORTED
FOG LAMP RELAY OUTPUT CKT SHORT
FOG LAMP RELAY MISSING
OPEN B(+)
OPEN FUSED B+ TO FOG RELAY
FOG LAMP RELAY
FOG LAMP RELAY CONTROL CKT OPEN
FOG LAMP RELAY CONTROL CKT SHORTED TO GROUND
BCM FOG LAMP RELAY CONTROL
FUSE #24

TEST	ACTION	APPLICABILITY
1	Check Junction Block fuse #24. Is fuse #24 open? Yes → Go To 2 No → Go To 4	All
2	Remove the Fog Lamp Relay from the Junction Block. Using an ohmmeter measure the Fog lamp relay coil terminals 85 and 86. Is the resistance between 70 and 80 ohms? Yes → Go To 3 No → Replace the Fog Lamp Relay. Perform BODY VERIFICATION TEST - VER 1.	All
3	Remove the Fog Lamp Relay from the Junction Block. Using an ohmmeter measure the Fog Lamp Relay Output circuit to ground. Is the resistance below 0.5 ohms? Yes → Repair the relay output circuit for a short to ground and replace the fuse if necessary. Perform BODY VERIFICATION TEST - VER 1. No → Replace the fuse. Perform BODY VERIFICATION TEST - VER 1.	All

FOG LAMP RELAY CKT SHORTED LO/OPEN — Continued

TEST	ACTION	APPLICABILITY
4	Looking at the Junction Block, see if the Fog Lamp Relay is present. Is the relay present? Yes → Go To 5 No → Install the missing relay. Perform BODY VERIFICATION TEST - VER 1.	All
5	For the results of this test to be valid voltage must be present at the Junction Block C5 connector cavity #3. Measure the voltage of the B(+) circuit to fuse #24. Is the voltage above 10.0 volts? Yes → Go To 6 No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.	All
6	Remove the Fog Lamp Relay from the Junction Block. Measure Fused B+ cavities for the Fog Lamp Relay in the Junction Block. Is the voltage above 10.0 volts at both cavities? Yes → Go To 7 No → Replace the junction block. Perform BODY VERIFICATION TEST - VER 1.	All
7	Install a known good relay in place of the Fog Lamp Relay. Does the system operate correctly? Yes → Replace the Fog Lamp Relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 8	All
8	Remove the Fog Lamp Relay from the Junction Block. Turn ignition off. Remove the Body Control Module from the Junction Block. Measure the resistance of the Fog Lamp Relay Control circuit between the relay and the Body Control Module. Is the resistance below 5.0 ohms? Yes → Go To 9 No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.	All
9	Remove the fog lamp relay from the Junction Block. Turn ignition off. Remove the Body Control Module from the Junction Block. Measure the resistance of the Fog Lamp Relay Control circuit to ground. Is the resistance below 10.0 ohms? Yes → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1. No → Go To 10	All
10	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
HAZARD RELAY CKT SHORTED HI

When Monitored and Set Condition:

HAZARD RELAY CKT SHORTED HI

When Monitored: Ignition in RUN and IOD fuse/connector installed.

Set Condition: This code is set if the BCM tries to activate the hazard lamps and excessive current is sinked into the BCM.

POSSIBLE CAUSES
COMBO FLASHER INTERNAL SHORT TO B(+)
HAZARD SWITCH SENSE CIRCUIT SHORTED TO B(+)
BCM HAZARD CIRCUIT SHORT TO VOLTAGE

TEST	ACTION	APPLICABILITY
1	Remove the combination flasher from the junction block With the DRB III erase BCM DTC's. Operate either the panic feature on the RKE fob or trigger the vehicle theft alarm. With the DRB re-read the BCM trouble codes. Did the "Hazard relay ckt shorted Hi" trouble code reset? Yes → Go To 2 No → Replace the Combination Flasher. Perform BODY VERIFICATION TEST - VER 1.	All
2	Remove the Combination Flasher from the Junction Block. Turn ignition off. Remove the Body Control Module from the Junction Block. Turn ignition on. Using a voltmeter measure the Hazard switch sense ckt cavity 9 to ground at the combination flasher socket in the Junction Block. Was the voltage greater than 1.0 volt? Yes → Repair the Hazard Switch Sense circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
HEADLAMP SW OPEN CKT

When Monitored and Set Condition:

HEADLAMP SW OPEN CKT

When Monitored: Ignition in RUN and IOD fuse/connector installed.

Set Condition: This DTC sets if the BCM detects voltage on the MUX circuit above 4.8 volts.

POSSIBLE CAUSES
HEADLAMP MUX VOLTS > 4.9
HEADLAMP SWITCH MUX OPEN
HEADLAMP SWITCH RETURN OPEN
BCM HEADLAMP MUX

TEST	ACTION	APPLICABILITY
1	Disconnect the left multi-function switch connector. Turn ignition on. Connect a jumper wire between headlamp switch MUX and headlamp switch return at the left multifunction switch. With the DRBIII® in Body Sensors, read the Headlamp sw volts. Does the DRB display ″Headlamp switch″ 0.0 volts? No → Go To 2 Yes → Replace the left multi-function switch Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the left multi-function switch connector. Disconnect the Body Control Module C-1 connector. Measure the resistance of the headlamp switch mux circuit from the BCM C1 connector to the left multi-function switch connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open Headlamp Switch Mux circuit. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn ignition off. Disconnect the left multi-function switch connector. Disconnect the Body Control Module-C1 connector. Using an ohmmeter measure the Headlamp Switch Return circuit from BCM to left multi-function. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open headlamp switch return circuit. Perform BODY VERIFICATION TEST - VER 1.	All

HEADLAMP SW OPEN CKT — Continued

TEST	ACTION	APPLICABILITY
4	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
HEADLAMP SW SHORT TO GROUND

When Monitored and Set Condition:

HEADLAMP SW SHORT TO GROUND

When Monitored: Ignition in RUN and IOD fuse/connector installed.

Set Condition: This DTC sets if the BCM detects voltage on the MUX circuit below 0.3 volts.

POSSIBLE CAUSES
HEADLAMP SWITCH MUX SHORTED
LEFT MULTI-FUNTION SWITCH SHORTED
BCM

TEST	ACTION	APPLICABILITY
1	Disconnect the left multi-function switch connector. Turn ignition on. Does the DRB display ″Headlamp switch″ 5.0 volts? No → Go To 2 Yes → Replace the left multi-function switch. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the left multi-function switch connector. Disconnect the Body Control Module C-1 connector. Measure the resistance of the headlamp switch mux circuit to ground at the left multi-function switch connector. Is the resistance below 5.0 ohms? Yes → Repair the Headlamp Switch Mux circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
HIGH BEAM RELAY CKT SHORTED HI

When Monitored and Set Condition:

HIGH BEAM RELAY CKT SHORTED HI

When Monitored: Ignition in RUN and IOD fuse/connector installed.

Set Condition: This condition is set when the BCM is trying to activate the High beam relay and excessive current is sinked into the BCM.

POSSIBLE CAUSES
HI BEAM RELAY
HIGH BEAM RELAY CONTROL CIRCUIT SHORTED TO B(+)
BCM HIGH BEAM CONTROL SHORT TO BATTERY

TEST	ACTION	APPLICABILITY
1	Install a known good relay in place of the High Beam relay. Does the system now operate correctly? Yes → Replace the High Beam relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Remove the High Beam relay from the Junction Block. Turn ignition off. Remove the Body Control Module from the Junction Block. Turn ignition on. Using a voltmeter measure the High Beam Relay control ckt cavity 86 to ground at the Junction Block. Was the voltage greater than 1.0 volt? Yes → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
LOW BEAM RELAY CKT SHORTED HI

When Monitored and Set Condition:

LOW BEAM RELAY CKT SHORTED HI

When Monitored: Ignition in RUN and IOD fuse/connector installed.

Set Condition: This condition is set when the BCM is trying to activate the lo beam relay and excessive current is sinked into the BCM.

POSSIBLE CAUSES
LOW BEAM RELAY
LOW BEAM RELAY CONTROL SHORTED TO B(+)
BCM LOW BEAM CONTROL SHORT TO BATTERY

TEST	ACTION	APPLICABILITY
1	Install a known good relay in place of the Low Beam relay. Does the system now operate correctly? Yes → Replace the Low Beam relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Remove the Low Beam relay from the Junction Block. Turn ignition off. Remove the Body Control Module from the Junction Block. Turn ignition on. Using a voltmeter measure the Low Beam Relay control ckt cavity 86 to ground at the Junction Block. Was the voltage greater than 1.0 volt? Yes → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
LOW BEAM RELAY CKT SHORTED LO/OPEN

When Monitored and Set Condition:

LOW BEAM RELAY CKT SHORTED LO/OPEN

When Monitored: Ignition in RUN and IOD fuse/connector installed.

Set Condition: This condition detects if the lo beam relay has not been installed in the vehicle by monitoring the BCM lo beam relay output for battery voltage applied.

POSSIBLE CAUSES
LOW BEAM RELAY
OPEN FUSED B(+)
LOW BEAM RELAY CTL CKT OPEN
LOW BEAM RELAY CONTROL CIRCUIT SHORTED TO GROUND
BCM LOW BEAM CONTROL CIRCUIT SHORTED LOW/OPEN
LOW BEAM RELAY MISSING

TEST	ACTION	APPLICABILITY
1	Install a known good relay in place of the Low Beam relay. Does the system now operate correctly? Yes → Replace the Low Beam relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Looking at the Junction Block, see if the relay is present. Is the relay present? Yes → Go To 3 No → Install the correct relay. Perform BODY VERIFICATION TEST - VER 1.	All
3	For the results of this test to be valid, voltage must be present at the Junction Block C5 connector cavity #1. Measure the voltage of the fused B(+) circuits to Low Beam relay cavities #30 and #85. Is the voltage above 10.0 volts at both cavities? Yes → Go To 4 No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.	All

LOW BEAM RELAY CKT SHORTED LO/OPEN — Continued

TEST	ACTION	APPLICABILITY
4	Remove the Low Beam relay from the Junction Block. Turn ignition off. Remove the Body Control Module from the Junction Block. Using an ohmmeter measure the Low Beam Relay control circuit from relay cavity 86 to the Junction Block Body Control Module connector cavity 4. Was the resistance below 5.0 ohms? Yes → Go To 5 No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn ignition off. Remove the Body Control Module from the Junction Block. Remove the Low Beam Relay from the junction block. Measure the resistance of the Low Beam Relay Control circuit. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.	All
6	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
PARK LAMP RELAY CKT SHORTED HI

When Monitored and Set Condition:

PARK LAMP RELAY CKT SHORTED HI

When Monitored: Ignition in RUN and IOD fuse/connector installed.

Set Condition: This condition is set when the BCM is trying to activate the park relay and excessive current is detected on the control circuit.

POSSIBLE CAUSES
PARK LAMP RELAY
BCM PARK LAMP CONTROL SHORT TO BATTERY
PARK LAMP RELAY CONTROL SH TO B(+)

TEST	ACTION	APPLICABILITY
1	Install a known good relay in place of the Park Lamp relay. Does the system now operate correctly? Yes → Replace the Park Lamp relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Remove the park lamp relay from the Junction Block. Turn ignition off. Remove the Body Control Module from the Junction Block. Turn ignition on. Using a voltmeter measure the Park Lamp Relay control ckt cavity 86 to ground at the Junction Block. Was the voltage greater than 1.0 volt? Yes → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
PARK LAMP RELAY CKT SHORTED LO/OPEN

When Monitored and Set Condition:

PARK LAMP RELAY CKT SHORTED LO/OPEN

When Monitored: Ignition in RUN and IOD fuse/connector installed.

Set Condition: The DTC is is set if the BCM detects excessive current on the park lamp relay control circuit.

POSSIBLE CAUSES
PARK LAMP RELAY OUTPUT CIRCUIT SHORT
PARK LAMP RELAY MISSING
PARK LAMP RELAY
PARK LAMP RELAY CTL CKT OPEN
OPEN FUSED B(+) TO PARK RELAY
OPEN B(+)
BCM PARKLAMP CONTROL CIRCUIT SHORTED LOW/OPEN
FUSE #6

TEST	ACTION	APPLICABILITY
1	Check J/B fuse #6. Is fuse #6 open? Yes → Go To 2 No → Go To 3	All
2	Remove the park lamp relay from the Junction Block. Using an ohmmeter measure the park lamp relay output circuit from relay cavity 30 to ground. Is the resistance below 0.6 ohms? Yes → Repair the relay output circuit for a short to ground and replace the fuse if necessary. Perform BODY VERIFICATION TEST - VER 1. No → Replace the fuse. Perform BODY VERIFICATION TEST - VER 1.	All
3	Looking at the Junction Block, see if the Park Lamp Relay is present. Is the relay present? Yes → Go To 4 No → Install the missing relay. Perform BODY VERIFICATION TEST - VER 1.	All

PARK LAMP RELAY CKT SHORTED LO/OPEN — Continued

TEST	ACTION	APPLICABILITY
4	Install a known good relay in place of the Park Lamp relay. Does the system now operate correctly? Yes → Replace the Parklamp Relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Remove the Park Lamp relay from the Junction Block. Turn ignition off. Remove the Body Control Module from the Junction Block. Using an ohmmeter measure the Park Lamp Relay control circuit from relay cavity 86 to the Junction Block Body Control Module connector cavity 1. Was the resistance below 5.0 ohms? Yes → Go To 6 No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.	All
6	For the results of this test to be valid, voltage must be present at the Junction Block C5 connector cavity #1. Measure the voltage of the B(+) circuit to fuse #6. Is the voltage above 10.0 volts? Yes → Go To 7 No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.	All
7	Remove the Park Lamp Relay from the Junction Block. Measure cavities 85 and 87 (fused B(+)) for the Park Lamp Relay at the Junction Block. Is the voltage above 10.0 volts at both cavities? Yes → Go To 8 No → Replace the junction block. Perform BODY VERIFICATION TEST - VER 1.	All
8	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
REAR FOG LAMP RELAY CKT OPEN

When Monitored and Set Condition:

REAR FOG LAMP RELAY CKT OPEN

When Monitored: Ignition switch in the On position and the IOD fuse installed.

Set Condition: This DTC sets if the BCM does not detect any voltage on the control circuit.

POSSIBLE CAUSES
JUNCTION BLOCK - REAR FOG LAMP RELAY CONTROL CKT SHORTED TO GROUND
REAR FOG LAMP RELAY OPEN
JUNCTION BLOCK - REAR FOG LAMP RELAY CONTROL CKT OPEN
BODY CONTROL MODULE
INSPECT FUSE #27
JUNCTION BLOCK - FUSED B+ CKT SHORTED TO GROUND
REAR FOG LAMP RELAY SHORTED
REAR FOG LAMP RELAY OUTPUT CIRCUIT SHORTED TO GROUND

TEST	ACTION	APPLICABILITY
1	Remove the Rear Fog Lamp Relay from the Junction Block. Using a 12-volt Test Light connected to ground, probe cavity 85 of the Rear Fog Lamp Relay connector. Is the test light illuminated? Yes → Go To 2 No → Go To 6	All
2	Remove the Rear Fog Lamp Relay from the Junction Block. Turn the ignition on. Using a 12-volt Test Light connected to 12-volts, probe cavity 86 of the Rear Fog Lamp Relay connector. With the DRB enter Body, Body Computer, then Actuator Tests. While monitoring the test light, actuate the Rear Fog Lamp Relay. Does the test light flash on and off as the relay is actuated? Yes → Replace the Rear Fog Lamp Relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

REAR FOG LAMP RELAY CKT OPEN — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Remove the Rear Fog Lamp Relay from the Junction Block. Remove the BCM from the Junction Block. Measure the resistance between ground and cavity 86 of the Rear Fog Lamp Relay connector. Is the resistance below 5.0 ohms? Yes → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Remove the Rear Fog Lamp Relay from the Junction Block. Remove the BCM from the Junction Block. Measure the resistance of the Rear Fog Lamp Relay Control circuit between the Rear Fog Lamp Relay connector cavity 86 and the Junction Block BCM connector cavity 13. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.	All
5	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All
6	Inspect fuse #27 in the Junction Block. Is the fuse open? Yes → Go To 7 No → Check the B+ feed circuit from the PDC fuse for an open or short. If ok, replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.	All
7	Remove the Rear Fog Lamp Relay from the Junction Block. Turn the ignition off. Measure the resistance between ground and cavity 30 of the Rear Fog Lamp Relay connector. Is the resistance below 5.0 ohms? Yes → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1. No → Go To 8	All
8	Turn the ignition off. Remove the Rear Fog Lamp Relay from the Junction Block. Remove the BCM from the Junction Block. Measure the resistance between ground and cavity 86 of the Rear Fog Lamp Relay connector. Is the resistance below 5.0 ohms? Yes → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1. No → Go To 9	All

REAR FOG LAMP RELAY CKT OPEN — Continued

TEST	ACTION	APPLICABILITY
9	Turn the ignition off. Remove the Rear Fog Lamp Relay from the Junction Block. Replace Fuse #27 in the Junction Block with a good fuse. Connect a jumper wire between cavity 30 and cavity 87 of the Rear Fog Lamp Relay connector. Inspect fuse #27 in the Junction Block. Is the fuse open? Yes → Check the Rear Fog Lamp Relay Output circuit for a short to ground. If ok, replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Rear Fog Lamp Relay. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
REAR FOG RELAY OUTPUT SHORTED HI

When Monitored and Set Condition:

REAR FOG RELAY OUTPUT SHORTED HI

When Monitored: Ignition switch in the On position and the IOD fuse installed.

Set Condition: This condition is set when the BCM is trying to activate the rear fog lamp relay and excessive current is detected on the control circuit.

POSSIBLE CAUSES
REAR FOG LAMP RELAY SHORTED TO VOLTAGE
JUNCTION BLOCK - REAR FOG LAMP RELAY CONTROL CKT SHORTED TO VOLTAGE
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Remove the Rear Fog Lamp Relay from the Junction Block. Turn the ignition on. Measure the voltage of the Rear Fog Lamp Relay Control circuit (cavity 86) in the Rear Fog Lamp Relay connector. Is the voltage above 1.0 volt? Yes → Go To 2 No → Replace the Rear Fog Lamp Relay. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Remove the Rear Fog Lamp Relay from the Junction Block. Remove the BCM from the Junction Block. Turn the ignition on. Measure the voltage of the Rear Fog Lamp Relay Control circuit (cavity 86) in the Rear Fog Lamp Relay connector. Is the voltage above 1.0 volt? Yes → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom List:
***AUTO HEADLAMPS WILL NOT TURN OFF**
***AUTO HEADLAMPS WILL NOT TURN ON**

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be *AUTO HEADLAMPS WILL NOT TURN OFF.

POSSIBLE CAUSES
HEADLAMP SWITCH FUNCTION
AUTOMATIC HEADLAMP LIGHT SENSOR OPEN
ULTRALIGHT SENSOR SIGNAL OPEN
BCM ULTRALIGHT SENSE CIRCUIT OPEN
AUTO HEADLAMP SENSOR CIRCUIT SHORTED
ULTRALIGHT SENSOR SIGNAL SHORTED TO GROUND
BCM ULTRALIGHT SENSE CIRCUIT SHORTED

TEST	ACTION	APPLICABILITY
1	With the DRB III read the ″AUTO HEADLAMP SENSE VOLTS″ under sensors while shinning a shop light on the Auto Headlamp Light sensor and then covering it up. The ″Auto Headlamp Sense″ voltage should change from approximately 0.0 to 5.0 volts, Choose outcome. A. Voltage in range Go To 2 B. Stays above 4.8 volts Go To 3 C. Stays below 0.5 volts Go To 7	All
2	With the DRB III under Body sensors, read the HEADLAMP SW VOLTS. Move the Headlamp switch to the different modes and compare the values to values shown. Headlamp switch OFF 4.4 VOLTS Parking lamps ON 3.2 VOLTS Headlamps ON 2.0 VOLTS Auto headlamps ON 0.6 VOLTS Do the values on the the DRB match. Yes → Test Complete. No → Replace the Left Multifunction Switch. Perform BODY VERIFICATION TEST - VER 1.	All

*AUTO HEADLAMPS WILL NOT TURN OFF — Continued

TEST	ACTION	APPLICABILITY
3	With the DRB III under Body sensors, read the HEADLAMP SW VOLTS. Move the Headlamp switch to the different modes and compare the values to values shown. Headlamp switch OFF 4.4 VOLTS Parking lamps ON 3.2 VOLTS Headlamps ON 2.0 VOLTS Auto headlamps ON 0.6 VOLTS Do the values on the the DRB match. Yes → Go To 4 No → Replace the Left Multifunction Switch. Perform BODY VERIFICATION TEST - VER 1.	All
4	Disconnect the Automatic headlamp light sensor/VTSS led 4-way connector. Connect a jumper from the ultra light sensor signal ckt to the ultra light sensor return ckt. With the DRB III in sensors read Auto head sensor volts. Does the DRB III show Auto head sensor volts under .5 volts? Yes → Replace the Automatic Headlamp Light Sensor/VTSS LED. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Disconnect the Auto headlamp light sensor 4-way connector. Disconnect the BCM C2 connector. Using an ohmmeter measure the ultralight sense circuit from the Auto headlamp light sensor 4-way to the BCM C2 connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the open Ultralight Sensor Signal circuit. Perform BODY VERIFICATION TEST - VER 1.	All
6	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All
7	With the DRB III under Body sensors, read the HEADLAMP SW VOLTS. Move the Headlamp switch to the different modes and compare the values to values shown. Headlamp switch OFF 4.4 VOLTS Parking lamps ON 3.2 VOLTS Headlamps ON 2.0 VOLTS Auto headlamps ON 0.6 VOLTS Do the values on the the DRB match. Yes → Go To 8 No → Replace the Left Multifunction Switch. Perform BODY VERIFICATION TEST - VER 1.	All
8	Disconnect the Automatic headlamp light sensor/VTSS led 4-way connector. With the DRB III in sensors read Auto Headlamp sensor volts. Does the DRB III display Auto Headlamp sensor above 4.8 volts? Yes → Replace the Auto Headlamp Light Sensor/VTSS LED. Perform BODY VERIFICATION TEST - VER 1. No → Go To 9	All

*AUTO HEADLAMPS WILL NOT TURN OFF — Continued

TEST	ACTION	APPLICABILITY
9	Disconnect the Auto headlamp light sensor 4-way connector. Disconnect the BCM C2 connector. Using an ohmmeter measure the ultralight sense signal circuit from the Auto headlamp light sensor 4-way to ground. Is the resistance below 5.0 ohms? Yes → Repair the Ultralight Sensor Signal circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 10	All
10	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*FLASH TO PASS INOPERATIVE

POSSIBLE CAUSES
JUNCTION BLOCK HIGH BEAM RELAY CONTROL OPEN
LEFT MULTI-FUNCTION SWITCH
HIGH BEAM RELAY CONTROL CIRCUIT OPEN TO LEFT MULTI-FUNCTION SWITCH

TEST	ACTION	APPLICABILITY
1	The High Beam Headlamps must be operational for the result of this test to be valid. Disconnect the Left Multi-Function switch harness connector. Measure the voltage of the High Beam Relay control circuit in the Left Multi-Function switch connector. Is the voltage above 10.0 volts? Yes → Replace the Left Multi-Function Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn ignition off. Disconnect the left multi-function switch connector. Disconnect the Junction Block C-3 harness connector. Using an ohmmeter measure the High Beam Relay control circuit from the left multi-function switch connector to the Junction Block C-3 connector. Was the resistance below 5.0 ohms? Yes → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1. No → Repair the High Beam Relay Control circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*FOG LAMPS WILL NOT TURN OFF

POSSIBLE CAUSES
FOG LAMP RELAY
JUNCTION BLOCK
FOG LAMP RELAY OUTPUT CIRCUIT SHORT TO BATTERY
FOG LAMP SWITCH SENSE SHORTED
FOG LAMP SWITCH OPEN/SHORTED
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	With the DRB III under Body Input/Outputs, read the Fog lamp switch state while turning the Fog lamp switch on and off. Did the fog lamp switch state change? Yes → Go To 2 No → Go To 4	All
2	Install a known good relay in place of the Fog Lamp relay. Does the system now operate correctly? Yes → Replace the Fog Lamp Relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Disconnect the Junction Block C-2 harness connector. Did the fog lamps turn off? Yes → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Relay Output circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1.	All
4	Disconnect the left multi-function switch connector if not already disconnected. Disconnect the BCM C2 connector Measure the fog lamp switch sense circuit to ground at the left multi-function switch connector. Is the resistance below 5.0 ohms? Yes → Repair the Fog Lamp Switch Sense for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All

*FOG LAMPS WILL NOT TURN OFF — Continued

TEST	ACTION	APPLICABILITY
5	Disconnect the left multi-function switch connector. With the DRB III under Body Input Outputs read the Fog Lamp switch state while connecting a jumper from the Fog lamp switch sense to the Headlamp switch return at the left multifunction Did the fog lamp switch state change? Yes → Replace the Left Multifunction Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*FOG LAMPS WILL NOT TURN ON

POSSIBLE CAUSES
JUNCTION BLOCK FOG LAMP RELAY OUTPUT CIRCUIT
FOG LAMP SWITCH SENSE SHORTED
OPEN B(+)
FOG LAMP RELAY OUTPUT CKT OPEN
FOG LAMP RELAY
FOG LAMP RELAY CTL CKT OPEN
FOG LAMP RELAY CTL CKT SHORTED TO GROUND
BCM FOG LAMP RELAY CONTROL
BCM FOG LAMP SENSE SHORTED
FOG LAMP SWITCH OPEN/SHORTED
FOG LAMP RELAY OUTPUT WIRE SHORT TO GROUND
FUSE #24

TEST	ACTION	APPLICABILITY
1	With the DRB III under Body Input Outputs read the Fog lamp switch state while turning the Fog lamp switch on and off. Did the fog lamp switch state change? Yes → Go To 2 No → Go To 11	All
2	Check Junction Block fuse #24. Is fuse #24 open? Yes → Go To 3 No → Go To 5	All
3	Remove the fog lamp relay from the Junction Block. Using an ohmmeter measure the fog lamp relay output circuit from relay cavity 87 to ground. Is the resistance below 0.5 ohms? Yes → Go To 4 No → Replace the fuse. Perform BODY VERIFICATION TEST - VER 1.	All

*FOG LAMPS WILL NOT TURN ON — Continued

TEST	ACTION	APPLICABILITY
4	Remove the fog lamp relay from the Junction Block. Disconnect the Junction Block C2 connector. Using an ohmmeter measure the fog lamp relay output circuit from relay cavity 87 to ground. Is the resistance below 0.5 ohms? Yes → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1. No → Repair the relay output wire for a short to ground and replace the fuse if necessary. Perform BODY VERIFICATION TEST - VER 1.	All
5	For the results of this test to be valid, voltage must be present at the Junction Block C5 connector cavity 3. Measure the voltage of the B(+) circuit to fuse #24. Is the voltage above 10.0 volts? Yes → Go To 6 No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.	All
6	Install a known good relay in place of the Fog Lamp relay. Does the system now operate correctly? Yes → Replace the Fog Lamp relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 7	All
7	Remove the Fog Lamp relay from the Junction Block. Disconnect a Fog Lamp bulb connector. Using an ohmmeter measure the Fog Lamp relay output circuit from relay cavity 87 to the fog lamp bulb connector. Is the resistance below 0.5 ohms? Yes → Go To 8 No → Repair the open fog lamp relay output circuit. Perform BODY VERIFICATION TEST - VER 1.	All
8	Remove the Fog Lamp Relay from the Junction Block. Turn ignition off. Remove the Body Control Module from the Junction Block. Using an ohmmeter measure the Fog Lamp Relay control circuit from relay cavity 86 to the Junction Block Body Control Module connector cavity 2. Was the resistance below 5.0 ohms? Yes → Go To 9 No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.	All
9	Remove the fog lamp relay from the Junction Block. Turn ignition off. Remove the Body Control Module from the Junction Block. Using an ohmmeter measure the Fog Lamp Relay control ckt cavity 86 to ground at the Junction Block. Was the resistance below 10 ohms? Yes → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1. No → Go To 10	All

*FOG LAMPS WILL NOT TURN ON — Continued

TEST	ACTION	APPLICABILITY
10	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All
11	Disconnect the left multi-function switch connector. With the DRBIII® under Body Input Outputs read the Fog Lamp switch state while connecting a jumper from the Fog Lamp Switch Sense to the Headlamp switch return at the left multi-function switch connector. Did the fog lamp switch state change? Yes → Replace the Left Multi-function switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 12	All
12	Disconnect the left multi-function switch connector if not already disconnected. Disconnect the BCM C2 connector Measure the Fog Lamp switch sense circuit to ground at the left multi-function switch connector. Is the resistance below 5.0 ohms? Yes → Repair the Fog lamp switch sense for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 13	All
13	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*HIGH BEAM HEADLAMPS WILL NOT TURN OFF

POSSIBLE CAUSES
HIGH BEAM RELAY CONTROL WIRE SHORT TO GROUND
JUNCTION BLOCK HIGH BEAM CONTROL SHORT TO GROUND
LEFT MULTI-FUNCTION SWITCH FLASH TO PASS CIRCUIT
LEFT MULTI-FUNCTION SWITCH HIGH BEAM SENSE CIRCUIT SHORTED
HIGH BEAM RELAY OUTPUT SHORTED B+
HIGH BEAM RELAY
HIGH BEAM SWITCH SENSE SHORTED
BCM DEF HIGH BEAM SWITCH SENSE SHORTED
BCM HIGH BEAM RELAY CONTROL SHORTED

TEST	ACTION	APPLICABILITY
1	With the DRBIII® under Body Input Outputs, read the High beam switch state while turning the High Beam switch on and off. Did the high beam switch state change? Yes → Go To 2 No → Go To 7	All
2	Install a known good relay in place of the High Beam relay. Does the system now operate correctly? Yes → Replace the High Beam relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Remove the High beam relay from the junction block. Are the High beam lamps still on? Yes → Repair the High beam relay output for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn ignition off. Remove the High Beam Relay from the Junction Block. Remove the Body Control Module from the Junction Block. Measure the resistance of the High Beam Relay Control circuit to ground at the relay connector. Is the resistance below 10.0 ohms? Yes → Go To 5 No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

*HIGH BEAM HEADLAMPS WILL NOT TURN OFF — Continued

TEST	ACTION	APPLICABILITY
5	Disconnect the left multi-function switch connector. Measure the resistance of the High Beam Relay Control circuit between the relay connector and ground. Is the resistance below 10.0 ohms? Yes → Go To 6 No → Replace the left multi-function switch. Perform BODY VERIFICATION TEST - VER 1.	All
6	Disconnect the Junction Block C3 connector. Measure the resistance of the High Beam Relay Control circuit between the relay connector and ground. Is the resistance below 10.0 ohms? Yes → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1. No → Repair the High Beam Relay Control wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1.	All
7	Disconnect the left multi-function switch connector. Did the High Beam Lamps turn off? Yes → Replace the left multi-function switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 8	All
8	Disconnect the left multi-function switch connector if not already disconnected. Disconnect the BCM C2 connector Measure the high beam switch sense circuit to ground at the left multi-function switch connector. Is the resistance below 5.0 ohms? Yes → Repair the high beam switch sense for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*HIGH BEAM HEADLAMPS WILL NOT TURN ON

POSSIBLE CAUSES
FUSED HIGH BEAM RELAY OUTPUT SHORT TO GROUND
HIGH BEAM RELAY OUTPUT CKT OPEN
OPEN FUSED B(+)
HIIGH BEAM RELAY
FUSES
HIGH BEAM SWITCH SENSE OPEN
HIGH BEAM RELAY CONTROL CIRCUIT OPEN
BCM HIGH BEAM CONTROL CIRCUIT
BCM HIGH BEAM SWITCH SENSE OPEN
JUMPER HIGH BEAM SWITCH SENSE TO GROUND

TEST	ACTION	APPLICABILITY
1	With the DRB III under Body Input Outputs read the High beam switch state while turning the high beam switch on and off. Did the high beam switch state change? Yes → Go To 2 No → Go To 9	All
2	Check Junction Block fuses #3 and #16. Are the fuses open? Yes → Go To 3 No → Go To 4	All
3	Using an ohmmeter measure the fused high Beam relay output circuit from the #3 fuse and then the #16 fuse to ground. Is the resistance below 0.4 ohms? Yes → Repair the fused high beam relay output for a short to ground and replace the fuse if necessary. Perform BODY VERIFICATION TEST - VER 1. No → Replace the fuse(s). Perform BODY VERIFICATION TEST - VER 1.	All
4	Install a known good relay in place of the High Beam relay. Does the system now operate correctly? Yes → Replace the High Beam relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All

*HIGH BEAM HEADLAMPS WILL NOT TURN ON — Continued

TEST	ACTION	APPLICABILITY
5	For the results of this test to be valid, voltage must present at the Junction Block C5 connector cavity #1. Measure the voltage of the fused B(+) circuits to High Beam relay cavities #30 and #85. Is the voltage above 10.0 volts at both cavities? Yes → Go To 6 No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.	All
6	Remove the High Beam relay from the Junction Block. Using an ohmmeter measure the High Beam relay output circuit from relay cavity 87 to the right high beam fuse #16 and then the left high beam fuse #3 in the Junction Block. Is the resistance below 5.0 ohms from cavity 87 to both high beam fuses? Yes → Go To 7 No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.	All
7	Remove the High Beam relay from the Junction Block. Turn ignition off. Remove the Body Control Module from the Junction Block. Measure the High Beam Relay control circuit from relay cavity to the Junction Block Body Control Module connector. Was the resistance below 5.0 ohms? Yes → Go To 8 No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.	All
8	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All
9	Disconnect the Left-Multifunction switch. With the DRBIII® under Body Input Outputs read the High beam switch state while jumping the high beam switch sense to ground. Did the high beam switch state change? Yes → Replace the Left-Multifunction switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 10	All
10	Disconnect the left multi-function switch connector if not already disconnected. Disconnect the BCM C2 connector Measure the High beam switch sense circuit from the left multi-function switch connector to the BCM C2 connector. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Repair the open High beam switch sense circuit. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*LOW BEAM HEADLAMPS WILL NOT TURN OFF

POSSIBLE CAUSES
LOW BEAM RELAY
LOW BEAM RELAY OUTPUT SHT B(+)
LOW BEAM RELAY CTL CKT SHORTED TO GROUND
HEADLAMP SWITCH FUNCTION
BCM LOW BEAM LAMPS WILL NOT TURN OFF

TEST	ACTION	APPLICABILITY
1	With the DRBIII® under Body sensors read the HEADLAMP SW VOLTS. Move the Headlamp switch to the different modes and compare the values to values shown. Headlamp switch OFF 4.4 VOLTS Parking lamps ON 3.2 VOLTS Headlamps ON 2.0 VOLTS Auto headlamps ON 0.6 VOLTS Do the values on the the DRB match. Yes → Go To 2 No → Replace the left multifunction switch. Perform BODY VERIFICATION TEST - VER 1.	All
2	Install a known good relay in place of the Low Beam relay. Does the system now operate correctly? Yes → Replace the Low Beam relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Remove the low beam relay from the Junction Block. Did the lamps turn off? Yes → Go To 4 No → Repair the low beam relay output circuit for a short to battery Perform BODY VERIFICATION TEST - VER 1.	All
4	Reinstall the Low Beam Relay if previously removed. Turn ignition off. Remove the Body Control Module from the Junction Block. Turn the ignition on. Did the low beam headlamps turn off? Yes → Go To 5 No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.	All
5	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*LOW BEAM HEADLAMPS WILL NOT TURN ON

POSSIBLE CAUSES
HEADLAMP SWITCH FUNCTION
LOW BEAM RELAY
LOW BEAM RELAY OUTPUT CKT OPEN
FUSE
LOW BEAM RELAY OUTPUT CKT SHORTED
BCM HEADLAMP MUX INOP

TEST	ACTION	APPLICABILITY
1	Check Junction Block fuses #14 and #15. Is one or both fuses open? Yes → Go To 2 No → Go To 3	All
2	Remove the Low Beam relay from the Junction Block. Remove both of the Low Beam relay fuses #14 and #15. Using an ohmmeter measure the Low Beam relay output circuit from relay cavity 87 to ground. Is the resistance below 0.4 ohms? Yes → Repair the relay output circuit for a short to ground and replace the fuse if necessary. Perform BODY VERIFICATION TEST - VER 1. No → Replace the fuse. Perform BODY VERIFICATION TEST - VER 1.	All
3	With the DRB III under Body sensors, read the HEADLAMP SW VOLTS. Move the Headlamp switch to the different modes and compare the values to values shown. Headlamp switch OFF 4.4 VOLTS Parking lamps ON 3.2 VOLTS Headlamps ON 2.0 VOLTS Auto headlamps ON 0.6 VOLTS Do the values on the the DRB match. Yes → Go To 4 No → Replace the left multifunction switch. Perform BODY VERIFICATION TEST - VER 1.	All
4	Install a known good relay in place of the Low Beam relay. Does the system now operate correctly? Yes → Replace the Low Beam relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All

*LOW BEAM HEADLAMPS WILL NOT TURN ON — Continued

TEST	ACTION	APPLICABILITY
5	Remove the Low Beam relay from the Junction Block. Ensure fuses #14 and #15 are installed in the Junction Block. Using an ohmmeter measure the Low Beam relay output circuit from relay cavity 87 to either the right or left front lighting module connectors. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.	All
6	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*PARK LAMPS WILL NOT TURN OFF

POSSIBLE CAUSES
HEADLAMP SWITCH FUNCTION
PARK LAMP RELAY
PARK LAMP OUTPUT SHT B(+)
PARK LAMP RELAY CTL CKT SHORTED TO GROUND
BCM PARK LAMP CONTROL CKT

TEST	ACTION	APPLICABILITY
1	With the DRBIII® under Body sensors read the HEADLAMP SW VOLTS. Move the Headlamp switch to the different modes and compare the values to values shown. Headlamp switch OFF 4.4 VOLTS Parking lamps ON 3.2 VOLTS Headlamps ON 2.0 VOLTS Auto headlamps ON 0.6 VOLTS Do the values on the the DRB match. Yes → Go To 2 No → Replace the left multifunction switch. Perform BODY VERIFICATION TEST - VER 1.	All
2	Install a known good relay in place of the park lamp relay. Does the system now operate correctly? Yes → Replace the parklamp relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Remove the Park Lamp relay from the Junction Block. Did the lamps turn off? Yes → Go To 4 No → Repair the park lamp relay output circuit for a short to battery Perform BODY VERIFICATION TEST - VER 1.	All
4	Install the park lamp relay if removed in previous test. Turn ignition off. Remove the Body Control Module from the Junction Block. Turn ignition on. Did the park lamps turn off? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*PARK LAMPS WILL NOT TURN ON

POSSIBLE CAUSES
CHECK BCM FOR DTCS
HEADLAMP SWITCH FUNCTION
PARK LAMP RELAY
PARK LAMP RELAY OUTPUT CKT OPEN
BCM HEADLAMP MUX INOP

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII® check the BCM for any DTCs. Are any DTCs set? Yes → Refer to symptom list and perform the appropriate symptom. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	With the DRBIII® under Body sensors read the HEADLAMP SW VOLTS. Move the Headlamp switch to the different modes and compare the values to values shown. Headlamp switch ″OFF″ 4.4 VOLTS Parking lamps ″ON″ 3.2 VOLTS Headlamps ″ON″ 2.0 VOLTS Auto headlamps ″ON″ 0.6 VOLTS Do the values on the the DRB match. Yes → Go To 3 No → Replace the left multifunction switch. Perform BODY VERIFICATION TEST - VER 1.	All
3	Install a known good relay in place of the park lamp relay. Does the system now operate correctly? Yes → Replace the parklamp relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Remove the park lamp relay from the Junction Block. Disconnect the appropriate lighting module connector. Using an ohmmeter measure the park lamp relay output circuit from relay cavity 30 to the appropriate lighting module connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the open park lamp relay output circuit. Perform BODY VERIFICATION TEST - VER 1.	All
5	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*REAR FOG LAMPS WILL NOT TURN OFF

POSSIBLE CAUSES
CHECK BCM FOR DTCS
CHECK THE LEFT MULTI-FUNCTION SWITCH OPERATION
REAR FOG LAMP RELAY
BODY CONTROL MODULE
JUNCTION BLOCK - REAR FOG LAMP RELAY OUTPUT CIRCUIT SHORTED TO GROUND
REAR FOG LAMP RELAY OUTPUT CIRCUIT SHORTED TO VOLTAGE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII® check the BCM for any DTCs. Are any DTCs set? Yes → Refer to symptom list and perform the appropriate symptom. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the Left Multi-Function Switch to the off position. With the DRBIII® enter Body Computer sensors and monitor the Headlamp SW voltage. Does the DRB display voltage at approximately 0.6 volts? Yes → Replace the Left Multi-Function Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Install a substitute relay in place of the Rear Fog Lamp Relay. **Note: Ensure the Left Multi-Function Switch is in the off position.** Did the Rear Fog Lamps turn off? Yes → Replace the Rear Fog Lamp Relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Remove the BCM from the Junction Block. Did the rear fog lamps turn off? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All

*REAR FOG LAMPS WILL NOT TURN OFF — Continued

TEST	ACTION	APPLICABILITY
5	Disconnect the Junction Block C1 harness connector. Did the rear fog lamps turn off? Yes → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Rear Fog Lamp Relay Output circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*REAR FOG LAMPS WILL NOT TURN ON

POSSIBLE CAUSES
CHECK BCM FOR DTCS
CHECK THE LEFT MULTI-FUNCTION SWITCH OPERATION
JUNCTION BLOCK - FUSED B+ CIRCUIT OPEN
REAR FOG LAMP RELAY
REAR FOG LAMP RELAY OUTPUT CIRCUIT OPEN
JUNCTION BLOCK - REAR FOG LAMP RELAY OUTPUT CIRCUIT OPEN
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB check the BCM for any DTCs. Are any DTCs set? Yes → Refer to symptom list and perform the appropriate symptom. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the Left Multi-Function Switch to the rear fog lamp position. With the DRB enter Body, Body Computer, then sensors and monitor the Headlamp Sw voltage. Does the DRB display voltage at approximately 0.6 volts? Yes → Go To 3 No → Replace the Left Multi-Function Switch. Perform BODY VERIFICATION TEST - VER 1.	All
3	Remove the Rear Fog Lamp Relay from the Junction Block. Using a 12-volt Test Light connected to ground, probe cavity 30 of the Rear Fog Lamp Relay connector. Is the test light illuminated? Yes → Go To 4 No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.	All
4	Install a substitute relay in place of the Rear Fog Lamp Relay. Turn the Rear Fog Lamps on. Did the Rear Fog Lamps turn on? Yes → Replace the Rear Fog Lamp Relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All

*REAR FOG LAMPS WILL NOT TURN ON — Continued

TEST	ACTION	APPLICABILITY
5	Turn the Rear Fog Lamps on. Using a 12-volt Test Light connected to ground, backprobe the Rear Fog Lamp Relay Output circuit at the Junction Block C1 connector cavity 5. Is the test light illuminated? Yes → Repair the Rear Fog Lamp Relay Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	Turn the ignition off. Remove the BCM from the Junction Block. Connect a jumper wire between ground and the J/B BCM connector cavity 13 (Junction Block side). Do the Rear Fog Lamps turn on when the jumper wire is connected? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
AMBIENT AIR TEMP FAILURE (AZC) (ACTIVE)

When Monitored and Set Condition:

AMBIENT AIR TEMP FAILURE (AZC) (ACTIVE)

When Monitored: Every 8 seconds with the ignition on.

Set Condition: When an outside air temperature signal is expected is not received in the maximum allowed time.

POSSIBLE CAUSES
AZC - AMBIENT AIR TEMP SENSOR
AMBIENT AIR TEMP FAILURE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. **Note: Ensure the DRB is capable of communicating with the BCM before continuing.** With the DRB, enter Body, Automatic Temp Control, Monitor Display then PCI Bus Info and observe the outside air temp display. Is the correct Outside Air Temp displayed? Yes → Replace the AZC Module. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Refer to the Overhead Console category and perform the symptom related to the ambient air temperature sensor. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
AMBIENT AIR TEMP FAILURE (AZC) (STORED)

When Monitored and Set Condition:

AMBIENT AIR TEMP FAILURE (AZC) (STORED)

When Monitored: Every 8 seconds with the ignition on.

Set Condition: When an outside air temperature signal is expected is not received in the maximum allowed time.

POSSIBLE CAUSES
AZC MODULE STORED CODES PRESENT
STORED CODES TEST COMPLETE

TEST	ACTION	APPLICABILITY
1	**Note: Active codes must be resolved before diagnosing stored codes.** Anytime a code becomes active during this test, proceed to the conclusion question. Turn the ignition on. With the DRB, erase any stored DTC's. Monitor the DRB for active codes during the following test steps. Turn the mode select switch to the panel position with the fan control on low. Manually sweep the driver and passenger temperature control knobs from cold to hot then back to cold. Manually sweep the blower motor control knob through all positions. Manually sweep the mode select switch knob through all positions. Manually press the recirculation mode switch on, wait 30 seconds then press it off. Manually press the A/C mode switch on, wait 30 seconds then press it off. With the DRB, perform the AZC self test. With the DRB, actuate all of the AZC door motors. Place the vehicle on a hoist, and raise the wheels off the floor. Start engine. Place the transmission in drive. Brake off. **WARNING: Be sure to keep hands and feet clear of rotating wheels. Keep clear of the engine's moving parts** Did any AZC code become active during this test? Yes → Return to the Symptom List and choose the active code. Perform BODY VERIFICATION TEST - VER 1. No → No problem found at this time. Erase all codes before returning vehicle to customer. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
BLOWER SELECT SW OPEN (AZC) (ACTIVE)

When Monitored and Set Condition:

BLOWER SELECT SW OPEN (AZC) (ACTIVE)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set if the AZC reads the blower switch value and it is above 250 A/D counts.

POSSIBLE CAUSES
BLOWER MOTOR SWITCH FAILED OPEN

TEST	ACTION	APPLICABILITY
1	When this code is present the AZC Module must be replaced. View repair Repair Replace the AZC Module. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
BLOWER SELECT SW OPEN (AZC) (STORED)

When Monitored and Set Condition:

BLOWER SELECT SW OPEN (AZC) (STORED)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set if the AZC reads the blower switch value and it is above 250 A/D counts.

POSSIBLE CAUSES
AZC MODULE STORED CODES PRESENT
STORED CODES TEST COMPLETE

TEST	ACTION	APPLICABILITY
1	**Note: Active codes must be resolved before diagnosing stored codes.** Anytime a code becomes active during this test, proceed to the conclusion question. Turn the ignition on. With the DRB, erase any stored DTC's. Monitor the DRB for active codes during the following test steps. Turn the mode select switch to the panel position with the fan control on low. Manually sweep the driver and passenger temperature control knobs from cold to hot then back to cold. Manually sweep the blower motor control knob through all positions. Manually sweep the mode select switch knob through all positions. Manually press the recirculation mode switch on, wait 30 seconds then press it off. Manually press the A/C mode switch on, wait 30 seconds then press it off. With the DRB, perform the AZC self test. With the DRB, actuate all of the AZC door motors. Place the vehicle on a hoist, and raise the wheels off the floor. Start engine. Place the transmission in drive. Brake off. **WARNING: Be sure to keep hands and feet clear of rotating wheels. Keep clear of the engine's moving parts** Did any AZC code become active during this test? Yes → Return to the Symptom List and choose the active code. Perform BODY VERIFICATION TEST - VER 1. No → No problem found at this time. Erase all codes before returning vehicle to customer. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
BLOWER SELECT SW SHORTED (AZC) (ACTIVE)

When Monitored and Set Condition:

BLOWER SELECT SW SHORTED (AZC) (ACTIVE)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set if the AZC reads the blower switch value and it is below 5 A/D counts.

POSSIBLE CAUSES
BLOWER MOTOR SWITCH FAILED SHORTED

TEST	ACTION	APPLICABILITY
1	When this code is present the AZC Module must be replaced. View repair Repair Replace the AZC Module. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
BLOWER SELECT SW SHORTED (AZC) (STORED)

When Monitored and Set Condition:

BLOWER SELECT SW SHORTED (AZC) (STORED)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set if the AZC reads the blower switch value and it is below 5 A/D counts.

POSSIBLE CAUSES
AZC MODULE STORED CODES PRESENT
STORED CODES TEST COMPLETE

TEST	ACTION	APPLICABILITY
1	**Note: Active codes must be resolved before diagnosing stored codes.** Anytime a code becomes active during this test, proceed to the conclusion question. Turn the ignition on. With the DRB, erase any stored DTC's. Monitor the DRB for active codes during the following test steps. Turn the mode select switch to the panel position with the fan control on low. Manually sweep the driver and passenger temperature control knobs from cold to hot then back to cold. Manually sweep the blower motor control knob through all positions. Manually sweep the mode select switch knob through all positions. With the DRB, perform the AZC self test. With the DRB, actuate all of the AZC door motors. Place the vehicle on a hoist, and raise the wheels off the floor. Start engine. Place the transmission in drive. Brake off. **WARNING: Be sure to keep hands and feet clear of rotating wheels. No → No problem found at this time. Erase all codes before returning vehicle to customer. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
CAL CHECKSUM FAILURE (AZC) (ACTIVE)

When Monitored and Set Condition:

CAL CHECKSUM FAILURE (AZC) (ACTIVE)

When Monitored: Ignition in RUN and IOD fuse installed after a battery disconnect.

Set Condition: This condition is set if the calibrated check sum does not match the stored value.

POSSIBLE CAUSES
AZC - CAL CHECKSUM FAILURE

TEST	ACTION	APPLICABILITY
1	When this code is present the AZC Module must be replaced. View repair Repair Replace the AZC Module. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
CAL CHECKSUM FAILURE (AZC) (STORED)

When Monitored and Set Condition:

CAL CHECKSUM FAILURE (AZC) (STORED)

When Monitored: Ignition in RUN and IOD fuse installed after a battery disconnect.

Set Condition: This condition is set if the calibrated check sum does not match the stored value.

POSSIBLE CAUSES
AZC MODULE STORED CODES PRESENT
STORED CODES TEST COMPLETE

TEST	ACTION	APPLICABILITY
1	**Note: Active codes must be resolved before diagnosing stored codes.** Anytime a code becomes active during this test, proceed to the conclusion question. Turn the ignition on. With the DRB, erase any stored DTC's. Monitor the DRB for active codes during the following test steps. Turn the mode select switch to the panel position with the fan control on low. Manually sweep the driver and passenger temperature control knobs from cold to hot then back to cold. Manually sweep the blower motor control knob through all positions. Manually sweep the mode select switch knob through all positions. With the DRB, perform the AZC self test. With the DRB, actuate all of the AZC door motors. No → No problem found at this time. Erase all codes before returning vehicle to customer. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
COUNTRY CODE FAILURE (AZC) (ACTIVE)

When Monitored and Set Condition:

COUNTRY CODE FAILURE (AZC) (ACTIVE)

When Monitored: Every 8 seconds with the ignition on.

Set Condition: This condition is set if the AZC does not receive the country code message within 8 seconds.

POSSIBLE CAUSES
COUNTRY CODE FAILURE
PROGRAM COUNTRY CODE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, enter Body, Body Computer then Module Display and observe the country code. Compare the country code to the VIN. Does the country code match the VIN? Yes → Replace the AZC Module. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Program the correct country code into the BCM and retest vehicle. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
COUNTRY CODE FAILURE (AZC) (STORED)

When Monitored and Set Condition:

COUNTRY CODE FAILURE (AZC) (STORED)

When Monitored: Every 8 seconds with the ignition on.

Set Condition: This condition is set if the AZC does not receive the country code message within 8 seconds.

POSSIBLE CAUSES
AZC MODULE STORED CODES PRESENT
STORED CODES TEST COMPLETE

TEST	ACTION	APPLICABILITY
1	**Note: Active codes must be resolved before diagnosing stored codes.** Anytime a code becomes active during this test, proceed to the conclusion question. Turn the ignition on. Symptom:
DRIVER BLEND DOOR NOT RESPONDING (AZC) (ACTIVE)

When Monitored and Set Condition:

DRIVER BLEND DOOR NOT RESPONDING (AZC) (ACTIVE)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set if the AZC does not receive feedback pulses within 5 seconds of the drive voltage being applied.

POSSIBLE CAUSES
DRIVER CIRCUIT (B) SHORTED TO GROUND
DRIVER CIRCUIT (A) SHORTED TO GROUND
DRIVER CIRCUITS (A) AND (B) SHORTED TOGETHER
AZC MODULE DRIVER BLEND DOOR NOT RESPONDING
DRIVER CIRCUIT (A) OPEN
DRIVER CIRCUIT (B) OPEN
DRIVER BLEND DOOR MOTOR

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the Driver Blend Door Motor/Actuator harness connector. Disconnect the AZC module C1 and C2 harness connectors. Measure the resistance between ground and the Driver Blend Door Driver (B) circuit. Is the resistance below 5.0 ohms? Yes → Repair the Driver Blend Door Driver (B) circuit for a short to ground. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the Driver Blend Door Motor/Actuator harness connector. Disconnect the AZC module C1 and C2 harness connectors. Measure the resistance between ground and the Driver Blend Door Driver (A) circuit. Is the resistance below 5.0 ohms? Yes → Repair the Driver Blend Door Driver (A) circuit for a short to ground. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

DRIVER BLEND DOOR NOT RESPONDING (AZC) (ACTIVE) — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Driver Blend Door Motor/Actuator harness connector. Disconnect the AZC module C1 and C2 harness connectors. Measure the resistance between the Driver Blend Door Driver (B) circuit and the Driver Blend Door Driver (A) circuit. Is the resistance below 5.0 ohms? Yes → Repair the Driver Blend Door Driver (B) circuit for a short to the Driver Blend Door Driver (A) circuit. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Disconnect the Driver Blend Door Motor/Actuator harness connector. Disconnect the AZC module C1 and C2 harness connectors. Measure the resistance of the Driver Blend Door Driver (A) circuit between the AZC Module C1 connector and the Driver Blend Door Motor/Actuator connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Driver Blend Door Driver (A) circuit for an open. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Disconnect the Driver Blend Door Motor/Actuator harness connector. Disconnect the AZC module C1 and C2 harness connectors. Measure the resistance of the Driver Blend Door Driver (B) circuit between the AZC Module C2 connector and the Driver Blend Door Motor/Actuator connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the Driver Blend Door Driver (B) circuit for an open. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. Make sure that the Driver Blend Door Motor harness connector is connected to the Driver Blend Door Motor. Disconnect the AZC module C1 and C2 harness connectors. Measure the resistance between the Driver Blend Door Driver (B) circuit and the Driver Blend Door Driver (A) circuit. Is the resistance between 26.0 and 46.0 ohms? Yes → Replace the AZC Module. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 7	All

DRIVER BLEND DOOR NOT RESPONDING (AZC) (ACTIVE) — Continued

TEST	ACTION	APPLICABILITY
7	If there are no possible causes remaining, view repair. Repair Replace the Driver Blend Door Motor. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
DRIVER BLEND DOOR NOT RESPONDING (AZC) (STORED)

When Monitored and Set Condition:

DRIVER BLEND DOOR NOT RESPONDING (AZC) (STORED)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set if the AZC does not receive feedback pulses within 5 seconds of the drive voltage being applied.

POSSIBLE CAUSES
AZC MODULE STORED CODES PRESENT
STORED CODES TEST COMPLETE

TEST	ACTION	APPLICABILITY
1	**Note: Active codes must be resolved before diagnosing stored codes.** Anytime a code becomes active during this test, proceed to the conclusion question. Turn the ignition on. With the DRB, erase any stored DTC's. Monitor the DRB for active codes during the following test steps. Turn the mode select switch to the panel position with the fan control on low. Manually sweep the driver and passenger temperature control knobs from cold to hot then back to cold. Manually sweep the blower motor control knob through all positions. Manually sweep the mode select switch knob through all positions. With the DRB, perform the AZC self test. With the DRB, actuate all of the AZC door motors. Place the vehicle on a hoist, and raise the wheels off the floor. Start engine. Place the transmission in drive. Brake off. **WARNING: Be sure to keep hands and feet clear of rotating wheels. Keep clear of the engine's moving parts** Did any AZC code become active during this test? Yes → Return to the Symptom List and choose the active code. Perform BODY VERIFICATION TEST - VER 1. No → No problem found at this time. Erase all codes before returning vehicle to customer. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
DRIVER BLEND DOOR RANGE TOO LARGE (AZC) (ACTIVE)

When Monitored and Set Condition:

DRIVER BLEND DOOR RANGE TOO LARGE (AZC) (ACTIVE)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set when the AZC monitors the travel range during system initialization and the measured range is greater than expected.

POSSIBLE CAUSES
CHECK THE AZC MODULE FOR DTCS
DRIVER CIRCUIT (B) SHORTED TO GROUND
DRIVER CIRCUIT (A) SHORTED TO GROUND
DRIVER BLEND DOOR MOTOR
DRIVER BLEND DOOR MOTOR
CHECK BLEND DOOR LINKAGE
AZC MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, read the active AZC DTC's. Is the Driver Blend Door Not Responding DTC set? Yes → Refer to the Heating and A/C category and perform the symptom Driver Blend Door Not Responding. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the Driver Blend Door Motor/Actuator harness connector. Disconnect the AZC module C1 and C2 harness connectors. Measure the resistance between ground and the Driver Blend Door Driver (B) circuit. Is the resistance below 5.0 ohms? Yes → Repair the Driver Blend Door Driver (B) circuit for a short to ground. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

DRIVER BLEND DOOR RANGE TOO LARGE (AZC) (ACTIVE) — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Driver Blend Door Motor/Actuator harness connector. Disconnect the AZC module C1 and C2 harness connectors. Measure the resistance between ground and the Driver Blend Door Driver (A) circuit. Is the resistance below 5.0 ohms? Yes → Repair the Driver Blend Door Driver (A) circuit for a short to ground. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Remove the Driver Blend Door Motor/Actuator from the vehicle. By hand, attempt to rotate the driver blend door motor in both directions. Did the blend door motor turn in either direction? Yes → Replace the Driver Blend Door Motor. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Remove the Driver Blend Door Motor from the vehicle. Rotate the blend door (door only), this should rotate approximately 45 degrees from stop to stop. Inspect the blend door linkage for excessive wear or missing linkage. Were any mechanical problems found? Yes → Repair or replace the blend door/linkage as necessary. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace the AZC Module. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
DRIVER BLEND DOOR RANGE TOO LARGE (AZC) (STORED)

When Monitored and Set Condition:

DRIVER BLEND DOOR RANGE TOO LARGE (AZC) (STORED)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set when the AZC monitors the travel range during system initialization and the measured range is greater than expected.

POSSIBLE CAUSES
AZC MODULE STORED CODES PRESENT
STORED CODES TEST COMPLETE

TEST	ACTION	APPLICABILITY
1	**Note: Active codes must be resolved before diagnosing stored codes.** Anytime a code becomes active during this test, proceed to the conclusion question. Turn the ignition on. Manually sweep the driver and passenger temperature control knobs from cold to hot then back to cold. Manually sweep the blower motor control knob through all positions. Manually sweep the mode select switch knob through all positions. With the DRB, perform the AZC self test. With the DRB, actuate all of the AZC door motors. Place the vehicle on a hoist, and raise the wheels off the floor. Start engine. Place the transmission in drive. Brake off. **WARNING: Be sure to keep hands and feet clear of rotating wheels. Keep clear of the engine's moving parts** Did any AZC code become active during this test? Yes → Return to the Symptom List and choose the active code. Perform BODY VERIFICATION TEST - VER 1. No → No problem found at this time. Erase all codes before returning vehicle to customer. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
DRIVER BLEND DOOR RANGE TOO SMALL (AZC) (ACTIVE)

When Monitored and Set Condition:

DRIVER BLEND DOOR RANGE TOO SMALL (AZC) (ACTIVE)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set when the AZC monitors the travel range during system initialization and the measured range is less than expected.

POSSIBLE CAUSES
CHECK THE AZC MODULE FOR DTCS
CHECK THE AZC SIGNAL TOO DRIVER BLEND DOOR
OBSTRUCTED BLEND DOOR
DRIVER BLEND DOOR MOTOR

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, read the active AZC DTC's. Is the Driver Blend Door Not Responding DTC set? Yes → Refer to the Heating and A/C category and perform the symptom Driver Blend Door Not Responding. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the Driver Blend Door Motor/Actuator harness connector. Connect a 12-volt Test Light across the Driver Blend Door Motor/Actuator harness connector. Turn the ignition on. While monitoring the test light, turn the driver blend control knob from lo to hi. **Note: Observe test light for approximately 30 seconds.** Does the test light start to flash and stay flashing? Yes → Go To 3 No → Replace the AZC Module. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

DRIVER BLEND DOOR RANGE TOO SMALL (AZC) (ACTIVE) — Continued

TEST	ACTION	APPLICABILITY
3	Remove the Driver Blend Door Motor from the vehicle. Rotate the blend door (door only), this should rotate approximately 45 degrees from stop to stop. Does the blend door move smoothly in both directions? Yes → Replace the Driver Blend Door Motor/Actuator. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Repair or replace the blend door as necessary. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
DRIVER BLEND DOOR RANGE TOO SMALL (AZC) (STORED)

When Monitored and Set Condition:

DRIVER BLEND DOOR RANGE TOO SMALL (AZC) (STORED)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set when the AZC monitors the travel range during system initialization and the measured range is less than expected.

POSSIBLE CAUSES
AZC MODULE STORED CODES PRESENT
STORED CODES TEST COMPLETE

TEST	ACTION	APPLICABILITY
1	**Note: Active codes must be resolved before diagnosing stored codes.** Anytime a code becomes active during this test, proceed to the conclusion question. Turn the ignition on. With the DRB, erase any stored DTC's. Monitor the DRB for active codes during the following test steps. Turn the mode select switch to the panel position with the fan control on low. Manually sweep the driver and passenger temperature control knobs from cold to hot then back to cold. Manually sweep the blower motor control knob through all positions. Manually sweep the mode select switch knob through all positions. With the DRB, perform the AZC self test. With the DRB, actuate all of the AZC door motors. Place the vehicle on a hoist, and raise the wheels off the floor. Start engine. Place the transmission in drive. Brake off. **WARNING: Be sure to keep hands and feet clear of rotating wheels. Keep clear of the engine's moving parts** Did any AZC code become active during this test? Yes → Return to the Symptom List and choose the active code. Perform BODY VERIFICATION TEST - VER 1. No → No problem found at this time. Erase all codes before returning vehicle to customer. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
ENGINE COOLANT RESPONSE FAILURE (AZC) (ACTIVE)

When Monitored and Set Condition:

ENGINE COOLANT RESPONSE FAILURE (AZC) (ACTIVE)

When Monitored: Every 8 seconds with the ignition on.

Set Condition: This condition is set if the AZC does not receive the engine coolant response message within 8 seconds.

POSSIBLE CAUSES
CHECK THE PCM FOR ANY DTCS
OBSERVE THE ECT DISPLAY IN THE INSTRUMENT CLUSTER
AUTOMATIC ZONE CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB check the PCM for any DTCs. Are any DTCs present? Yes → Refer to the Powertrain Diagnostic Information. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition on. With the DRB, enter Body, Electro/Mech Cluster (MIC), Monitor Display then PCI Bus Engine Info and monitor the engine coolant temperature display. Does the DRB display approximately the correct engine coolant temperature? Yes → Go To 3 No → Replace and program the Powertrain Control Module in accordance with the Service Information. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
3	With the DRB, erase the AZC DTC's. Turn the ignition on, wait 1 minute, then check for any AZC DTCs. Did this DTC reset? Yes → Replace the AZC Module. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
ENGINE COOLANT RESPONSE FAILURE (AZC) (STORED)

When Monitored and Set Condition:

ENGINE COOLANT RESPONSE FAILURE (AZC) (STORED)

When Monitored: Every 8 seconds with the ignition on.

Set Condition: This condition is set if the AZC does not receive the engine coolant response message within 8 seconds.

POSSIBLE CAUSES
AZC MODULE STORED CODES PRESENT
STORED CODES TEST COMPLETE

TEST	ACTION	APPLICABILITY
1	**Note: Active codes must be resolved before diagnosing stored codes.** Anytime a code becomes active during this test, proceed to the conclusion question. Turn the ignition on. With the DRB, erase any stored DTC's. Monitor the DRB for active codes during the following test steps. Turn the mode select switch to the panel position with the fan control on low. Manually sweep the driver and passenger temperature control knobs from cold to hot then back to cold. Manually sweep the blower motor control knob through all positions. Manually sweep the mode select switch knob through all positions. With the DRB, perform the AZC self test. With the DRB, actuate all of the AZC door motors. Place the vehicle on a hoist, and raise the wheels off the floor. Start engine. Place the transmission in drive. Brake off. **WARNING: Be sure to keep hands and feet clear of rotating wheels. No → No problem found at this time. Erase all codes before returning vehicle to customer. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
ENGINE RPM FAILURE (AZC) (ACTIVE)

When Monitored and Set Condition:

ENGINE RPM FAILURE (AZC) (ACTIVE)

When Monitored: Every 8 seconds with the ignition on.

Set Condition: This condition is set if the AZC does not receive the engine RPM response message within 8 seconds.

POSSIBLE CAUSES
CHECK THE PCM FOR ANY DTCS
OBSERVE THE RPM DISPLAY IN THE INSTRUMENT CLUSTER
AUTOMATIC ZONE CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB check the PCM for any DTCs. Are any DTCs present? Yes → Refer to the Powertrain Diagnostic Information. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition on. With the DRB, enter Body, Electro/Mech Cluster (MIC), Monitor Display then PCI Bus Engine Info and monitor the engine RPM display. Start the engine. Does the DRB display approximately the correct engine RPM? Yes → Go To 3 No → Replace and program the Powertrain Control Module in accordance with the Service Information. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
3	With the DRB, erase the AZC DTC's. Start the engine, wait 1 minute, then check for any AZC DTCs. Did this DTC reset? Yes → Replace the AZC Module. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
ENGINE RPM FAILURE (AZC) (STORED)

When Monitored and Set Condition:

ENGINE RPM FAILURE (AZC) (STORED)

When Monitored: Every 8 seconds with the ignition on.

Set Condition: This condition is set if the AZC does not receive the engine RPM response message within 8 seconds.

POSSIBLE CAUSES
AZC MODULE STORED CODES PRESENT
STORED CODES TEST COMPLETE

TEST	ACTION	APPLICABILITY
1	**Note: Active codes must be resolved before diagnosing stored codes.** Anytime a code becomes active during this test, proceed to the conclusion question. Turn the ignition on. With the DRB, erase any stored DTC's. Monitor the DRB for active codes during the following test steps. Turn the mode select switch to the panel position with the fan control on low. Manually sweep the driver and passenger temperature control knobs from cold to hot then back to cold. Manually sweep the blower motor control knob through all positions. Manually sweep the mode select switch knob through all positions. With the DRB, perform the AZC self test. With the DRB, actuate all of the AZC door motors. Place the vehicle on a hoist, and raise the wheels off the floor. Start engine. Place the transmission in drive. Brake off. **WARNING: Be sure to keep hands and feet clear of rotating wheels. Keep clear of the engine's moving parts** Did any AZC code become active during this test? Yes → Return to the Symptom List and choose the active code. Perform BODY VERIFICATION TEST - VER 1. No → No problem found at this time. Erase all codes before returning vehicle to customer. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
EVAP TEMP SENSOR OPEN (MTC & AZC)

When Monitored and Set Condition:

EVAP TEMP SENSOR OPEN (MTC & AZC)

When Monitored: With the ignition on.

Set Condition: This DTC is displayed if the BCM detects an abnormally high voltage on the Evaporator Temperature Sensor Signal circuit.

POSSIBLE CAUSES
EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
BODY CONTROL MODULE
EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN
SENSOR GROUND CIRCUIT OPEN
EVAPORATOR TEMPERATURE SENSOR
WIRING HARNESS INSPECTION

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, erase all BCM DTC's. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read the BCM DTC's. Does the DRBIII® display this DTC? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition off. Disconnect the BCM C2 harness connector. Turn the ignition on. Measure the voltage of the Evaporator Temperature Sensor Signal circuit. Is there any voltage present? Yes → Repair the Evaporator Temperature Sensor Signal circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

EVAP TEMP SENSOR OPEN (MTC & AZC) — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the BCM C2 harness connector. Measure the resistance between the Evaporator Temperature Sensor Signal circuit and the Sensor Ground circuit. The approximate circuit resistance should be: 2,874 ohms @ 38°C (100°F). 3,214 ohms @ 35°C (95°F). 3,659 ohms @ 32°C (90°F). 4,125 ohms @ 29°C (85°F). 4,615 ohms @ 27°C (80°F). 5,238 ohms @ 24°C (75°F). 5,902 ohms @ 21°C (70°F). 6,733 ohms @ 18°C (65°F). 7,633 ohms @ 16°C (60°F). 8,611 ohms @ 13°C (55°F). 9,838 ohms @ 10°C (50°F). 11,199 ohms @ 7°C (45°F). 13,125 ohms @ 4°C (40°F). 14,883 ohms @ 2°C (35°F). 17,143 ohms @ -1°C (30°F). Is the resistance within the specifications? Yes → Replace and program the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Disconnect the BCM C2 harness connector. Disconnect the Evaporator Temperature Sensor harness connector. Measure the resistance of the Evaporator Temperature Sensor Signal circuit between the BCM C2 harness connector and the Evaporator Temperature Sensor harness connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Evaporator Temperature Sensor Signal circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Disconnect the BCM C2 harness connector. Disconnect the Evaporator Temperature Sensor harness connector. Measure the resistance of the Sensor Ground circuit between the BCM C2 harness connector and the Evaporator Temperature Sensor harness connector. Is the resistance below 5.0 ohms? Yes → Rplace the Evaporator Temperature Sensor in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Sensor Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

EVAP TEMP SENSOR OPEN (MTC & AZC) — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off. **NOTE: Visually inspect the related wiring harness and circuits. Look for any chafed, pierced, pinched, or partially broken wires.** **NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.** **NOTE: Refer to any Technical Service Bulletins (TSB) that may apply.** Were any problems found? Yes → Repair as necessary. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
EVAP TEMP SENSOR SHORTED (MTC & AZC)

When Monitored and Set Condition:

EVAP TEMP SENSOR SHORTED (MTC & AZC)

When Monitored: With the ignition on.

Set Condition: This DTC is displayed if the BCM detects an abnormally low voltage on the Evaporator Temperature Sensor Signal circuit.

POSSIBLE CAUSES
EVAPORATOR TEMPERATURE SENSOR
EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO GROUND
EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO SENSOR GROUND CIRCUIT
BODY CONTROL MODULE
WIRING HARNESS INSPECTION

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, erase all BCM DTC's. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read the BCM DTC's. Does the DRBIII® display this DTC? Yes → Go To 2 No → Go To 5	All
2	Turn the ignition off. Disconnect the Evaporator Temperature Sensor harness connector. Turn the ignition on. With the DRBIII®, erase all BCM DTC's. Cycle the ignition switch from off to on and wait 10 seconds. With the DRBIII®, read the BCM DTC's. Does the DRBIII® display: Evap Temp Sensor Open? Yes → Replace the Evaporator Temperature Sensor in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

EVAP TEMP SENSOR SHORTED (MTC & AZC) — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the BCM C2 harness connector. Disconnect the Evaporator Temperature Sensor harness connector. Measure the resistance between ground and the Evaporator Temperature Sensor Signal circuit. Is the resistance above 100k ohms? Yes → Go To 4 No → Repair the Evaporator Temperature Sensor Signal circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1.	All
4	Turn the ignition off. Disconnect the Body Control Module C2 harness connector. Disconnect the Evaporator Temperature Sensor harness connector. Measure the resistance between the Evaporator Temperature Sensor Signal circuit and the Sensor Ground circuit. Is the resistance above 100k ohms? Yes → Replace and program the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Evaporator Temperature Sensor Signal circuit for a short to Sensor Ground. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. **NOTE: Visually inspect the related wiring harness and circuits. Look for any chafed, pierced, pinched, or partially broken wires.** **NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.** **NOTE: Refer to any Technical Service Bulletins (TSB) that may apply.** Were any problems found? Yes → Repair as necessary. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
IAT RESPONSE FAILURE (AZC) (ACTIVE)

When Monitored and Set Condition:

IAT RESPONSE FAILURE (AZC) (ACTIVE)

When Monitored: Every 8 seconds with the ignition on.

Set Condition: This condition is set if the AZC does not receive the intake air temperature response message within 8 seconds.

POSSIBLE CAUSES
CHECK THE PCM FOR ANY DTCS
AUTOMATIC ZONE CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB check the PCM for any DTCs. Are any DTCs present? Yes → Refer to the Powertrain Diagnostic Information. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	With the DRB, erase the AZC DTC's. Turn the ignition on, wait 1 minute, then check for any AZC DTCs. Did this DTC reset? Yes → Replace the AZC Module. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
IAT RESPONSE FAILURE (AZC) (STORED)

When Monitored and Set Condition:

IAT RESPONSE FAILURE (AZC) (STORED)

When Monitored: Every 8 seconds with the ignition on.

Set Condition: This condition is set if the AZC does not receive the intake air temperature response message within 8 seconds.

POSSIBLE CAUSES
AZC MODULE STORED CODES PRESENT
STORED CODES TEST COMPLETE

TEST	ACTION	APPLICABILITY
1	**Note: Active codes must be resolved before diagnosing stored codes.** Anytime a code becomes active during this test, proceed to the conclusion question. Turn the ignition on. With the DRB, erase any stored DTC's. Monitor the DRB for active codes during the following test steps. Turn the mode select switch to the panel position with the fan control on low. Manually sweep the driver and passenger temperature control knobs from cold to hot then back to cold. Manually sweep the blower motor control knob through all positions. Manually sweep the mode select switch knob through all positions. With the DRB, perform the AZC self test. With the DRB, actuate all of the AZC door motors. Place the vehicle on a hoist, and raise the wheels off the floor. Start engine. Place the transmission in drive. Brake off. **WARNING: Be sure to keep hands and feet clear of rotating wheels. Keep clear of the engine's moving parts** Did any AZC code become active during this test? Yes → Return to the Symptom List and choose the active code. Perform BODY VERIFICATION TEST - VER 1. No → No problem found at this time. Erase all codes before returning vehicle to customer. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
MODE DOOR RANGE TOO LARGE (AZC) (ACTIVE)

When Monitored and Set Condition:

MODE DOOR RANGE TOO LARGE (AZC) (ACTIVE)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set when the AZC monitors the travel range during system initialization and the measured range is greater than expected.

POSSIBLE CAUSES
CHECK THE AZC MODULE FOR DTCS
MODE DOOR DRIVER CIRCUIT (B) SHORTED TO GROUND
MODE DOOR DRIVER CIRCUIT (A) SHORTED TO GROUND
MODE DOOR MOTOR
MODE DOOR MOTOR
CHECK MODE DOOR LINKAGE
AZC MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, read the active AZC DTC's. Is the Mode Motor Not Responding DTC set? Yes → Refer to the Heating and A/C category and perform the symptom Mode Motor Not Responding. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the Mode Door Motor/Actuator harness connector. Disconnect the AZC module C1 harness connector. Measure the resistance between ground and the Mode Door Driver (B) circuit. Is the resistance below 5.0 ohms? Yes → Repair the Mode Door Driver (B) circuit for a short to ground. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

MODE DOOR RANGE TOO LARGE (AZC) (ACTIVE) — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Mode Door Motor/Actuator harness connector. Disconnect the AZC module C1 harness connector. Measure the resistance between ground and the Mode Door Driver (A) circuit. Is the resistance below 5.0 ohms? Yes → Repair the Mode Door Driver (A) circuit for a short to ground. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Remove the Mode Door Motor/Actuator from the vehicle. By hand, attempt to rotate the mode door motor in both directions. Did the mode door motor turn in either direction? Yes → Replace the Mode Door Motor. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Remove the Mode Door Motor from the vehicle. Rotate the mode doors (doors only), these should rotate approximately 45 degrees from stop to stop. Inspect the mode door linkage for excessive wear or missing linkage. Were any mechanical problems found? Yes → Repair or replace the mode door/linkage as necessary. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace the AZC Module. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
MODE DOOR RANGE TOO LARGE (AZC) (STORED)

When Monitored and Set Condition:

MODE DOOR RANGE TOO LARGE (AZC) (STORED)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set when the AZC monitors the travel range during system initialization and the measured range is greater than expected.

POSSIBLE CAUSES
AZC MODULE STORED CODES PRESENT
STORED CODES TEST COMPLETE

TEST	ACTION	APPLICABILITY
1	**Note: Active codes must be resolved before diagnosing stored codes.** Anytime a code becomes active during this test, proceed to the conclusion question. Turn the ignition on. With the DRB, erase any stored DTC's. Monitor the DRB for active codes during the following test steps. Turn the mode select switch to the panel position with the fan control on low. Manually sweep the driver and passenger temperature control knobs from cold to hot then back to cold. Manually sweep the blower motor control knob through all positions. Manually sweep the mode select switch knob through all positions. With the DRB, perform the AZC self test. With the DRB, actuate all of the AZC door motors. Place the vehicle on a hoist, and raise the wheels off the floor. Start engine. Place the transmission in drive. Brake off. **WARNING: Be sure to keep hands and feet clear of rotating wheels. Keep clear of the engine's moving parts** Did any AZC code become active during this test? Yes → Return to the Symptom List and choose the active code. Perform BODY VERIFICATION TEST - VER 1. No → No problem found at this time. Erase all codes before returning vehicle to customer. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
MODE DOOR RANGE TOO SMALL (AZC) (ACTIVE)

When Monitored and Set Condition:

MODE DOOR RANGE TOO SMALL (AZC) (ACTIVE)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set when the AZC monitors the travel range during system initialization and the measured range is less than expected.

POSSIBLE CAUSES
CHECK THE AZC MODULE FOR DTCS
CHECK THE AZC SIGNAL TOO MODE DOOR
OBSTRUCTED MODE DOOR
MODE DOOR MOTOR

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, read the active AZC DTC's. Is the Mode Motor Not Responding DTC set? Yes → Refer to the Heating and A/C category and perform the symptom Mode Motor Not Responding. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the Mode Door Motor/Actuator harness connector. Connect a 12-volt Test Light across the Mode Door Motor/Actuator harness connector. Turn the ignition on. While monitoring the test light, turn the mode control knob in each position. **Note: Observe test light for approximately 30 seconds.** Does the test light start to flash and stay flashing? Yes → Go To 3 No → Replace the AZC Module. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

MODE DOOR RANGE TOO SMALL (AZC) (ACTIVE) — Continued

TEST	ACTION	APPLICABILITY
3	Remove the Mode Door Motor from the vehicle. Rotate the mode doors (doors only), these should rotate approximately 45 degrees from stop to stop. Do the mode doors move smoothly in both directions? Yes → Replace the Mode Door Motor. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Repair or replace the mode door as necessary. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
MODE DOOR RANGE TOO SMALL (AZC) (STORED)

When Monitored and Set Condition:

MODE DOOR RANGE TOO SMALL (AZC) (STORED)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set when the AZC monitors the travel range during system initialization and the measured range is less than expected.

POSSIBLE CAUSES
AZC MODULE STORED CODES PRESENT
STORED CODES TEST COMPLETE

TEST	ACTION	APPLICABILITY
1	**Note: Active codes must be resolved before diagnosing stored codes.** Anytime a code becomes active during this test, proceed to the conclusion question. Turn the ignition on. With the DRB, erase any stored DTC's. Monitor the DRB for active codes during the following test steps. Turn the mode select switch to the panel position with the fan control on low. Manually sweep the driver and passenger temperature control knobs from cold to hot then back to cold. Manually sweep the blower motor control knob through all positions. Manually sweep the mode select switch knob through all positions. With the DRB, perform the AZC self test. With the DRB, actuate all of the AZC door motors. Place the vehicle on a hoist, and raise the wheels off the floor. Start engine. Place the transmission in drive. Brake off. **WARNING: Be sure to keep hands and feet clear of rotating wheels. Keep clear of the engine's moving parts** Did any AZC code become active during this test? Yes → Return to the Symptom List and choose the active code. Perform BODY VERIFICATION TEST - VER 1. No → No problem found at this time. Erase all codes before returning vehicle to customer. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
MODE MOTOR NOT RESPONDING (AZC) (ACTIVE)

When Monitored and Set Condition:

MODE MOTOR NOT RESPONDING (AZC) (ACTIVE)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set if the AZC does not receive feedback pulses within 5 seconds of the drive voltage being applied.

POSSIBLE CAUSES
MODE DOOR DRIVER CIRCUIT (B) SHORTED TO GROUND
MODE DOOR DRIVER CIRCUIT (A) SHORTED TO GROUND
MODE DOOR DRIVER CIRCUITS (A) AND (B) SHORTED TOGETHER
AZC MODULE MODE DOOR NOT RESPONDING
MODE DOOR DRIVER CIRCUIT (A) OPEN
MODE DOOR DRIVER CIRCUIT (B) OPEN
MODE DOOR MOTOR

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the Mode Door Motor/Actuator harness connector. Disconnect the AZC module C1 harness connector. Measure the resistance between ground and the Mode Door Driver (B) circuit. Is the resistance below 5.0 ohms? Yes → Repair the Mode Door Driver (B) circuit for a short to ground. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the Mode Door Motor/Actuator harness connector. Disconnect the AZC module C1 harness connector. Measure the resistance between ground and the Mode Door Driver (A) circuit. Is the resistance below 5.0 ohms? Yes → Repair the Mode Door Driver (A) circuit for a short to ground. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

MODE MOTOR NOT RESPONDING (AZC) (ACTIVE) — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Mode Door Motor/Actuator harness connector. Disconnect the AZC module C1 harness connector. Measure the resistance between the Mode Door Driver (B) circuit and the Mode Door Driver (A) circuit. Is the resistance below 5.0 ohms? Yes → Repair the Mode Door Driver (B) circuit for a short to the Mode Door Driver (A) circuit. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Disconnect the Mode Door Motor/Actuator harness connector. Disconnect the AZC module C1 harness connector. Measure the resistance of the Mode Door Driver (A) circuit between the AZC Module C1 connector and the Mode Door Motor/Actuator connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Mode Door Driver (A) circuit for an open. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Disconnect the Mode Door Motor/Actuator harness connector. Disconnect the AZC module C1 harness connector. Measure the resistance of the Mode Door Driver (B) circuit between the AZC Module C1 connector and the Mode Door Motor/Actuator connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the Mode Door Driver (B) circuit for an open. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. Make sure that the Mode Door Motor harness connector is connected to the Mode Door Motor. Disconnect the AZC module C1 harness connector. Measure the resistance between the Mode Door Driver (B) circuit and the Mode Door Driver (A) circuit. Is the resistance between 26.0 and 46.0 ohms? Yes → Replace the AZC Module. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 7	All

MODE MOTOR NOT RESPONDING (AZC) (ACTIVE) — Continued

TEST	ACTION	APPLICABILITY
7	If there are no possible causes remaining, view repair. Repair Replace the Mode Door Motor. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
MODE MOTOR NOT RESPONDING (AZC) (STORED)

When Monitored and Set Condition:

MODE MOTOR NOT RESPONDING (AZC) (STORED)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set if the AZC does not receive feedback pulses within 5 seconds of the drive voltage being applied.

POSSIBLE CAUSES
AZC MODULE STORED CODES PRESENT
STORED CODES TEST COMPLETE

TEST	ACTION	APPLICABILITY
1	**Note: Active codes must be resolved before diagnosing stored codes.** Anytime a code becomes active during this test, proceed to the conclusion question. Turn the ignition on. With the DRB, erase any stored DTC's. Monitor the DRB for active codes during the following test steps. Turn the mode select switch to the panel position with the fan control on low. Manually sweep the driver and passenger temperature control knobs from cold to hot then back to cold. Manually sweep the blower motor control knob through all positions. Manually sweep the mode select switch knob through all positions. With the DRB, perform the AZC self test. With the DRB, actuate all of the AZC door motors. Place the vehicle on a hoist, and raise the wheels off the floor. Start engine. Place the transmission in drive. Brake off. **WARNING: Be sure to keep hands and feet clear of rotating wheels. Keep clear of the engine's moving parts** Did any AZC code become active during this test? Yes → Return to the Symptom List and choose the active code. Perform BODY VERIFICATION TEST - VER 1. No → No problem found at this time. Erase all codes before returning vehicle to customer. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
MODE SELECT SW OPEN (AZC) (ACTIVE)

When Monitored and Set Condition:

MODE SELECT SW OPEN (AZC) (ACTIVE)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set if the AZC reads the mode select switch value and it is above 250 A/D counts.

POSSIBLE CAUSES
MODE SELECT SWITCH FAILED OPEN

TEST	ACTION	APPLICABILITY
1	When this code is present the AZC Module must be replaced. View repair Repair Replace the AZC Module. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
MODE SELECT SW OPEN (AZC) (STORED)

When Monitored and Set Condition:

MODE SELECT SW OPEN (AZC) (STORED)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set if the AZC reads the mode select switch value and it is above 250 A/D counts.

POSSIBLE CAUSES
AZC MODULE STORED CODES PRESENT
STORED CODES TEST COMPLETE

TEST	ACTION	APPLICABILITY
1	**Note: Active codes must be resolved before diagnosing stored codes.** Anytime a code becomes active during this test, proceed to the conclusion question. Turn the ignition on. With the DRB, erase any stored DTC's. Monitor the DRB for active codes during the following test steps. Turn the mode select switch to the panel position with the fan control on low. Manually sweep the driver and passenger temperature control knobs from cold to hot then back to cold. Manually sweep the blower motor control knob through all positions. Manually sweep the mode select switch knob through all positions. Manually press the recirculation mode switch on, wait 30 seconds then press it off. Manually press the A/C mode switch on, wait 30 seconds then press it off. With the DRB, perform the AZC self test. With the DRB, actuate all of the AZC door motors. Place the vehicle on a hoist, and raise the wheels off the floor. Start engine. Place the transmission in drive. Brake off. **WARNING: Be sure to keep hands and feet clear of rotating wheels. Keep clear of the engine's moving parts** Did any AZC code become active during this test? Yes → Return to the Symptom List and choose the active code. Perform BODY VERIFICATION TEST - VER 1. No → No problem found at this time. Erase all codes before returning vehicle to customer. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
MODE SELECT SW SHORTED (AZC) (ACTIVE)

When Monitored and Set Condition:

MODE SELECT SW SHORTED (AZC) (ACTIVE)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set if the AZC reads the mode select switch value and it is below 5 A/D counts.

POSSIBLE CAUSES
MODE SELECT SWITCH FAILED SHORTED

TEST	ACTION	APPLICABILITY
1	When this code is present the AZC Module must be replaced. View repair Repair Replace the AZC Module. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
MODE SELECT SW SHORTED (AZC) (STORED)

When Monitored and Set Condition:

MODE SELECT SW SHORTED (AZC) (STORED)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set if the AZC reads the mode select switch value and it is below 5 A/D counts.

POSSIBLE CAUSES
AZC MODULE STORED CODES PRESENT
STORED CODES TEST COMPLETE

TEST	ACTION	APPLICABILITY
1	**Note: Active codes must be resolved before diagnosing stored codes.** Anytime a code becomes active during this test, proceed to the conclusion question. Turn the ignition on. With the DRB, erase any stored DTC's. Monitor the DRB for active codes during the following test steps. Turn the mode select switch to the panel position with the fan control on low. Manually sweep the driver and passenger temperature control knobs from cold to hot then back to cold. Manually sweep the blower motor control knob through all positions. Manually sweep the mode select switch knob through all positions. With the DRB, perform the AZC self test. With the DRB, actuate all of the AZC door motors. Place the vehicle on a hoist, and raise the wheels off the floor. Start engine. Place the transmission in drive. Brake off. **WARNING: Be sure to keep hands and feet clear of rotating wheels. Keep clear of the engine's moving parts** Did any AZC code become active during this test? Yes → Return to the Symptom List and choose the active code. Perform BODY VERIFICATION TEST - VER 1. No → No problem found at this time. Erase all codes before returning vehicle to customer. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
PASS BLEND DOOR NOT RESPONDING (AZC) (ACTIVE)

When Monitored and Set Condition:

PASS BLEND DOOR NOT RESPONDING (AZC) (ACTIVE)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set if the AZC does not receive feedback pulses within 5 seconds of the drive voltage being applied.

POSSIBLE CAUSES
DRIVER CIRCUIT (B) SHORTED TO GROUND
DRIVER CIRCUIT (A) SHORTED TO GROUND
DRIVER CIRCUITS (A) AND (B) SHORTED TOGETHER
AZC MODULE PASSENGER BLEND DOOR NOT RESPONDING
DRIVER CIRCUIT (A) OPEN
DRIVER CIRCUIT (B) OPEN
PASSENGER BLEND DOOR MOTOR

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the in-line C202 harness connector. Disconnect the AZC module C2 harness connector. Measure the resistance between ground and the Passenger Blend Door Driver (B) circuit. Is the resistance below 5.0 ohms? Yes → Repair the Passenger Blend Door Driver (B) circuit for a short to ground. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the in-line C202 harness connector. Disconnect the AZC module C2 harness connector. Measure the resistance between ground and the Passenger Blend Door Driver (A) circuit. Is the resistance below 5.0 ohms? Yes → Repair the Passenger Blend Door Driver (A) circuit for a short to ground. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

PASS BLEND DOOR NOT RESPONDING (AZC) (ACTIVE) — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the in-line C202 harness connector. Disconnect the AZC module C2 harness connector. Measure the resistance between the Passenger Blend Door Driver (B) circuit and the Passenger Blend Door Driver (A) circuit. Is the resistance below 5.0 ohms? Yes → Repair the Passenger Blend Door Driver (B) circuit for a short to the Passenger Blend Door Driver (A) circuit. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Disconnect the in-line C202 harness connector. Disconnect the AZC module C2 harness connector. Measure the resistance of the Passenger Blend Door Driver (A) circuit between the AZC Module C2 connector and the in-line C202 connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Passenger Blend Door Driver (A) circuit for an open. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Disconnect the in-line C202 harness connector. Disconnect the AZC module C2 harness connector. Measure the resistance of the Passenger Blend Door Driver (B) circuit between the AZC Module C2 connector and the in-line C202 connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the Passenger Blend Door Driver (B) circuit for an open. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. Make sure that the in-line C202 harness connector is connected. Disconnect the AZC module C2 harness connector. Measure the resistance between the Passenger Blend Door Driver (B) circuit and the Passenger Blend Door Driver (A) circuit. Is the resistance between 26.0 and 46.0 ohms? Yes → Replace the AZC Module. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 7	All

PASS BLEND DOOR NOT RESPONDING (AZC) (ACTIVE) — Continued

TEST	ACTION	APPLICABILITY
7	**Note: Before replacing the passenger blend door motor, inspect the wiring harness between the in-line C202 connector and the blend door motor for any opens or shorts. Repair as necessary.** If there are no possible causes remaining, view repair. Repair Replace the Passenger Blend Door Motor. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
PASS BLEND DOOR NOT RESPONDING (AZC) (STORED)

When Monitored and Set Condition:

PASS BLEND DOOR NOT RESPONDING (AZC) (STORED)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set if the AZC does not receive feedback pulses within 5 seconds of the drive voltage being applied.

POSSIBLE CAUSES
AZC MODULE STORED CODES PRESENT
STORED CODES TEST COMPLETE

TEST	ACTION	APPLICABILITY
1	**Note: Active codes must be resolved before diagnosing stored codes.** Anytime a code becomes active during this test, proceed to the conclusion question. Turn the ignition on. Manually sweep the driver and passenger temperature control knobs from cold to hot then back to cold. Manually sweep the blower motor control knob through all positions. Manually sweep the mode select switch knob through all positions. With the DRB, perform the AZC self test. With the DRB, actuate all of the AZC door motors. Place the vehicle on a hoist, and raise the wheels off the floor. Start engine. Place the transmission in drive. Brake off. **WARNING: Be sure to keep hands and feet clear of rotating wheels. Keep clear of the engine's moving parts** Did any AZC code become active during this test? Yes → Return to the Symptom List and choose the active code. Perform BODY VERIFICATION TEST - VER 1. No → No problem found at this time. Erase all codes before returning vehicle to customer. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
PASS BLEND DOOR RANGE TOO LARGE (AZC) (ACTIVE)

When Monitored and Set Condition:

PASS BLEND DOOR RANGE TOO LARGE (AZC) (ACTIVE)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set when the AZC monitors the travel range during system initialization and the measured range is greater than expected.

POSSIBLE CAUSES
CHECK THE AZC MODULE FOR DTCS
DRIVER CIRCUIT (B) SHORTED TO GROUND
DRIVER CIRCUIT (A) SHORTED TO GROUND
PASSENGER BLEND DOOR MOTOR
PASSENGER BLEND DOOR MOTOR
CHECK BLEND DOOR LINKAGE
AZC MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, read the active AZC DTC's. Is the Pass Blend Door Not Responding DTC set? Yes → Refer to the Heating and A/C category and perform the symptom Pass Blend Door Not Responding. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the in-line C202 harness connector. Disconnect the AZC module C2 harness connector. Measure the resistance between ground and the Passenger Blend Door Driver (B) circuit. Is the resistance below 5.0 ohms? Yes → Repair the Passenger Blend Door Driver (B) circuit for a short to ground. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

PASS BLEND DOOR RANGE TOO LARGE (AZC) (ACTIVE) — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the in-line C202 harness connector. Disconnect the AZC module C2 harness connector. Measure the resistance between ground and the Passenger Blend Door Driver (A) circuit. Is the resistance below 5.0 ohms? Yes → Repair the Passenger Blend Door Driver (A) circuit for a short to ground. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Remove the Passenger Blend Door Motor/Actuator from the vehicle. By hand, attempt to rotate the passenger blend door motor in both directions. Did the blend door motor turn in either direction? Yes → Replace the Passenger Blend Door Motor. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Remove the Passenger Blend Door Motor from the vehicle. Rotate the blend door (door only), this should rotate approximately 45 degrees from stop to stop. Inspect the blend door linkage for excessive wear or missing linkage. Were any mechanical problems found? Yes → Repair or replace the blend door/linkage as necessary. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace the AZC Module. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
PASS BLEND DOOR RANGE TOO LARGE (AZC) (STORED)

When Monitored and Set Condition:

PASS BLEND DOOR RANGE TOO LARGE (AZC) (STORED)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set when the AZC monitors the travel range during system initialization and the measured range is greater than expected.

Symptom:
PASS BLEND DOOR RANGE TOO SMALL (AZC) (ACTIVE)

When Monitored and Set Condition:

PASS BLEND DOOR RANGE TOO SMALL (AZC) (ACTIVE)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set when the AZC monitors the travel range during system initialization and the measured range is less than expected.

POSSIBLE CAUSES
CHECK THE AZC MODULE FOR DTCS
CHECK THE AZC SIGNAL TOO PASSENGER BLEND DOOR
OBSTRUCTED BLEND DOOR
PASSENGER BLEND DOOR MOTOR

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, read the active AZC DTC's. Is the Pass Blend Door Not Responding DTC set? Yes → Refer to the Heating and A/C category and perform the symptom Pass Blend Door Not Responding. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the in-line C202 harness connector. Connect a 12-volt Test Light across the passenger blend door driver (A) circuit and the passenger blend door driver (B) circuit at the C202 harness connector (AZC harness side). Turn the ignition on. While monitoring the test light, turn the passenger blend control knob from lo to hi. **Note: Observe test light for approximately 30 seconds.** Does the test light start to flash and stay flashing? Yes → Go To 3 No → Replace the AZC Module. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

PASS BLEND DOOR RANGE TOO SMALL (AZC) (ACTIVE) — Continued

TEST	ACTION	APPLICABILITY
3	Remove the Passenger Blend Door Motor from the vehicle. Rotate the blend door (door only), this should rotate approximately 45 degrees from stop to stop. Does the blend door move smoothly in both directions? Yes → Replace the Passenger Blend Door Motor/Actuator. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Repair or replace the blend door as necessary. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
PASS BLEND DOOR RANGE TOO SMALL (AZC) (STORED)

When Monitored and Set Condition:

PASS BLEND DOOR RANGE TOO SMALL (AZC) (STORED)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set when the AZC monitors the travel range during system initialization and the measured range is less than expected.

POSSIBLE CAUSES

Symptom:
RECIRC MOTOR NOT RESPONDING (AZC) (ACTIVE)

When Monitored and Set Condition:

RECIRC MOTOR NOT RESPONDING (AZC) (ACTIVE)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set if the AZC does not receive feedback pulses within 5 seconds of the drive voltage being applied.

POSSIBLE CAUSES
DRIVER CIRCUIT (B) SHORTED TO GROUND
DRIVER CIRCUIT (A) SHORTED TO GROUND
DRIVER CIRCUITS (A) AND (B) SHORTED TOGETHER
AZC MODULE RECIRCULATION MOTOR NOT RESPONDING
DRIVER CIRCUIT (A) OPEN
DRIVER CIRCUIT (B) OPEN
RECIRCULATION DOOR MOTOR

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the in-line C202 harness connector. Disconnect the AZC module C1 harness connector. Measure the resistance between ground and the Recirculation Door Driver (B) circuit. Is the resistance below 5.0 ohms? Yes → Repair the Recirculation Door Driver (B) circuit for a short to ground. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the in-line C202 harness connector. Disconnect the AZC module C1 harness connector. Measure the resistance between ground and the Recirculation Door Driver (A) circuit. Is the resistance below 5.0 ohms? Yes → Repair the Recirculation Door Driver (A) circuit for a short to ground. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

RECIRC MOTOR NOT RESPONDING (AZC) (ACTIVE) — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the in-line C202 harness connector. Disconnect the AZC module C1 harness connector. Measure the resistance between the Recirculation Door Driver (B) circuit and the Recirculation Door Driver (A) circuit. Is the resistance below 5.0 ohms? Yes → Repair the Recirculation Door Driver (B) circuit for a short to the Recirculation Door Driver (A) circuit. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Disconnect the in-line C202 harness connector. Disconnect the AZC module C1 harness connector. Measure the resistance of the Recirculation Door Driver (A) circuit between the AZC Module C1 connector and the in-line C202 connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Recirculation Door Driver (A) circuit for an open. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Disconnect the in-line C202 harness connector. Disconnect the AZC module C1 harness connector. Measure the resistance of the Recirculation Door Driver (B) circuit between the AZC Module C1 connector and the in-line C202 connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the Recirculation Door Driver (B) circuit for an open. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. Make sure that the in-line C202 harness connector is connected. Disconnect the AZC module C1 harness connector. Measure the resistance between the Recirculation Door Driver (B) circuit and the Recirculation Door Driver (A) circuit. Is the resistance between 26.0 and 46.0 ohms? Yes → Replace the AZC Module. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 7	All

RECIRC MOTOR NOT RESPONDING (AZC) (ACTIVE) — Continued

TEST	ACTION	APPLICABILITY
7	**Note: Before replacing the recirculation door motor, inspect the wiring harness between the in-line C202 connector and the recirculation door motor for any opens or shorts. Repair as necessary.** If there are no possible causes remaining, view repair. Repair Replace the Recirculation Door Motor. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
RECIRC MOTOR NOT RESPONDING (AZC) (STORED)

When Monitored and Set Condition:

RECIRC MOTOR NOT RESPONDING (AZC) (STORED)

When Monitored: Ignition in RUN and IOD fuse installed.

Set Condition: This condition is set if the AZC does not receive feedback pulses within 5 seconds of the drive voltage being applied.

POSSIBLE CAUSES
AZC MODULE STORED CODES PRESENT
STORED CODES TEST COMPLETE

TEST	ACTION	APPLICABILITY
1	**Note: Active codes must be resolved before diagnosing stored codes.** Anytime a code becomes active during this test, proceed to the conclusion question. Turn the ignition on. With the DRB, erase any stored DTC's. Monitor the DRB for active codes during the following test steps. Turn the mode select switch to the panel position with the fan control on low. Manually sweep the driver and passenger temperature control knobs from cold to hot then back to cold. Manually sweep the mode select switch knob through all positions. With the DRB, perform the AZC self test. With the DRB, actuate all of the AZC door motors. Place the vehicle on a hoist, and raise the wheels off the floor. Start engine. Place the transmission in drive. Brake off. **WARNING: Be sure to keep hands and feet clear of rotating wheels. Keep clear of the engine's moving parts** Did any AZC code become active during this test? Yes → Return to the Symptom List and choose the active code. Perform BODY VERIFICATION TEST - VER 1. No → No problem found at this time. Erase all codes before returning vehicle to customer. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
VEHICLE SPEED FAILURE (AZC) (ACTIVE)

When Monitored and Set Condition:

VEHICLE SPEED FAILURE (AZC) (ACTIVE)

When Monitored: Every 8 seconds with the ignition on.

Set Condition: This condition is set if the AZC does not receive the vehicle speed response message within 8 seconds.

POSSIBLE CAUSES
CHECK THE PCM FOR ANY DTCS
OBSERVE THE VEHICLE SPEED DISPLAY IN THE INSTRUMENT CLUSTER
AUTOMATIC ZONE CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB check the PCM for any DTCs. Are any DTCs present? Yes → Refer to the Powertrain Diagnostic Information. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Raise the drive wheels off the ground. **Warning: Be sure to keep hands and feet clear of rotating wheels.** With the DRB, enter Body, Electro/Mech Cluster (MIC), Monitor Display then PCI Bus Engine Info and monitor the vehicle speed display. Start the engine and place the transmission in any forward gear. Does the DRB display vehicle speed above zero? Yes → Go To 3 No → Replace and program the Powertrain Control Module in accordance with the Service Information. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All
3	With the DRB, erase the AZC DTC's. Test drive vehicle, then check for any AZC DTCs. Did this DTC reset? Yes → Replace the AZC Module. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
VEHICLE SPEED FAILURE (AZC) (STORED)

When Monitored and Set Condition:

VEHICLE SPEED FAILURE (AZC) (STORED)

When Monitored: Every 8 seconds with the ignition on.

Set Condition: This condition is set if the AZC does not receive the vehicle speed response message within 8 seconds.

POSSIBLE CAUSES
AZC MODULE STORED CODES PRESENT
STORED CODES TEST COMPLETE

TEST	ACTION	APPLICABILITY
1	**Note: Active codes must be resolved before diagnosing stored codes.** Anytime a code becomes active during this test, proceed to the conclusion question. Turn the ignition on. With the DRB, erase any stored DTC's. Monitor the DRB for active codes during the following test steps. Turn the mode select switch to the panel position with the fan control on low. Manually sweep the driver and passenger temperature control knobs from cold to hot then back to cold. Manually sweep the blower motor control knob through all positions. Manually sweep the mode select switch knob through all positions. With the DRB, perform the AZC self test. With the DRB, actuate all of the AZC door motors. Place the vehicle on a hoist, and raise the wheels off the floor. Start engine. Place the transmission in drive. Brake off. **WARNING: Be sure to keep hands and feet clear of rotating wheels. Keep clear of the engine's moving parts** Did any AZC code become active during this test? Yes → Return to the Symptom List and choose the active code. Perform BODY VERIFICATION TEST - VER 1. No → No problem found at this time. Erase all codes before returning vehicle to customer. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
VEHICLE VIN FAILURE (AZC) (ACTIVE)

When Monitored and Set Condition:

VEHICLE VIN FAILURE (AZC) (ACTIVE)

When Monitored: Every 8 seconds with the ignition on.

Set Condition: This condition is set if the AZC does not receive the vehicle VIN response message within 8 seconds.

POSSIBLE CAUSES
VEHICLE VIN FAILURE
POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, enter Engine then Miscellaneous. Compare the VIN that is programmed into the PCM with the VIN plate on the vehicle. Do the VIN(s) match? Yes → Replace the AZC Module. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace and program the Powertrain Control Module in accordance with the Service Information. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
VEHICLE VIN FAILURE (AZC) (STORED)

When Monitored and Set Condition:

VEHICLE VIN FAILURE (AZC) (STORED)

When Monitored: Every 8 seconds with the ignition on.

Set Condition: This condition is set if the AZC does not receive the vehicle VIN response message within 8 seconds.

POSSIBLE CAUSES
AZC MODULE STORED CODES PRESENT
STORED CODES TEST COMPLETE

TEST	ACTION	APPLICABILITY
1	**Note: Active codes must be resolved before diagnosing stored codes.** Anytime a code becomes active during this test, proceed to the conclusion question. Turn the ignition on. With the DRB, erase any stored DTC's. Monitor the DRB for active codes during the following test steps. Turn the mode select switch to the panel position with the fan control on low. Manually sweep the driver and passenger temperature control knobs from cold to hot then back to cold. Manually sweep the blower motor control knob through all positions. Manually sweep the mode select switch knob through all positions. With the DRB, perform the AZC self test. With the DRB, actuate all of the AZC door motors. Place the vehicle on a hoist, and raise the wheels off the floor. Start engine. Place the transmission in drive. Brake off. **WARNING: Be sure to keep hands and feet clear of rotating wheels. Keep clear of the engine's moving parts** Did any AZC code become active during this test? Yes → Return to the Symptom List and choose the active code. Perform BODY VERIFICATION TEST - VER 1. No → No problem found at this time. Erase all codes before returning vehicle to customer. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
VF DIMMING FAILURE (AZC) (ACTIVE)

When Monitored and Set Condition:

VF DIMMING FAILURE (AZC) (ACTIVE)

When Monitored: Every 8 seconds with the ignition on.

Set Condition: This condition is set if the AZC does not receive the VF dimming response message within 8 seconds.

POSSIBLE CAUSES
AZC - VF DIMMING FAILURE
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	With the DRB, read the BCM codes. These BCM DTC'S must NOT be present before continuing, for THIS test to be valid: Head Lamp SW Open CKT, Headlamp Sw Short to Ground, DIM SW Open CKT, DIM SW Short to Ground. With the DRB, enter Automatic Temp Control, Monitor Display then PCI Bus Info and look for the VF DIM Msg Present. Does the DRB display: VF DIM Msg present: Yes? Yes → Replace the AZC Module. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. With the DRB, Reset Module after repair/replacement is completed. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
VF DIMMING FAILURE (AZC) (STORED)

When Monitored and Set Condition:

VF DIMMING FAILURE (AZC) (STORED)

When Monitored: Every 8 seconds with the ignition on.

Set Condition: This condition is set if the AZC does not receive the VF dimming response message within 8 seconds.

POSSIBLE CAUSES
AZC MODULE STORED CODES PRESENT
STORED CODES TEST COMPLETE

TEST	ACTION	APPLICABILITY
1	**Note: Active codes must be resolved before diagnosing stored codes.** Anytime a code becomes active during this test, proceed to the conclusion question. Turn the ignition on. With the DRB, erase any stored DTC's. Monitor the DRB for active codes during the following test steps. Turn the mode select switch to the panel position with the fan control on low. Manually sweep the driver and passenger temperature control knobs from cold to hot then back to cold. Manually sweep the blower motor control knob through all positions. Manually sweep the mode select switch knob through all positions. With the DRB, perform the AZC self test. With the DRB, actuate all of the AZC door motors. Place the vehicle on a hoist, and raise the wheels off the floor. Start engine. Place the transmission in drive. Brake off. **WARNING: Be sure to keep hands and feet clear of rotating wheels. Keep clear of the engine's moving parts** Did any AZC code become active during this test? Yes → Return to the Symptom List and choose the active code. Perform BODY VERIFICATION TEST - VER 1. No → No problem found at this time. Erase all codes before returning vehicle to customer. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*A/C SWITCH SIGNAL NOT OPERATING PROPERLY (MTC & AZC)

POSSIBLE CAUSES
A/C OPERATES WITH A/C SELECT SWITCH OFF
A/C INOPERABLE WITH NO DTCS PRESENT

TEST	ACTION	APPLICABILITY
1	**NOTE: This test applies to both manual and automatic temperature control systems.** Which condition is present? A/C Operates With A/C Select Switch Off Refer to *A/C Operates With A/C Select Switch Off in the Powertrain Diagnostic Information. Perform BODY VERIFICATION TEST - VER 1. A/C Inoperable With No DTCS Present For vehicles gasoline engines, refer to *Checking A/C System Operation With No DTCs in the Powertrain Diagnostic Information. For vehicles with diesel engines, refer to *A/C Inoperative in the Powertrain Diagnostic Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*BLOWER MOTOR ALWAYS RUNS AT ONE SPEED ONLY (AZC)

POSSIBLE CAUSES
BLOWER MOTOR CONTROL CKT SHORTED TO GROUND
BLOWER MOTOR CONTROL CIRCUIT SHORTED TO BLOWER MOTOR HIGH DRIVER CIRCUIT
AZC MODULE, FAN STUCK ON ONE SPEED ONLY
BLOWER MOTOR CONTROLLER

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the Blower Motor Controller harness connector. Disconnect the AZC module C2 harness connector. Measure the resistance between ground and the Blower Motor Control circuit. Is the resistance below 5.0 ohms? Yes → Repair the Blower Motor Control circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the Blower Motor Controller harness connector. Disconnect the Blower Motor harness connector. Measure the resistance between the Blower Motor Control circuit and the Blower Motor High Driver circuit. Is the resistance below 5.0 ohms? Yes → Repair the Blower Motor Control circuit for a short to the Blower Motor High Driver circuit. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Reconnect all previous disconnected components. Use the DRB oscilloscope, select Lab Scope and set the following lab scope parameters. Set voltage range to +10.0v. Set probe to X10. Set time to 20ms/Div. Using the oscilloscope lead, backprobe the Blower Motor Control circuit at the Blower Motor Controller harness connector. Turn the ignition on. Set the blower switch to LO then slowly move to HI while observing the DRB display. The Scope patten should appear similar to what is provided in the reference material (Section 8.0). The voltage should cycle from approximately 0.5 volts, up to 5.0 volts in the low speed fan position. The duty cycle pattern should change smoothly as the blower switch is turned from LO to HI. The pattern should completely flatline when the blower speed reaches the HI setting. Does the DRB display a duty cycle pattern that changes from approximately 0.5 to 5.0 volts in LO? Yes → Go To 4 No → Replace the AZC Module. Perform BODY VERIFICATION TEST - VER 1. **NOTE: With the DRB, Reset Module after repair/replacement is completed.**	All

*BLOWER MOTOR ALWAYS RUNS AT ONE SPEED ONLY (AZC) — Continued

TEST	ACTION	APPLICABILITY
4	If there are no possible causes remaining, view repair. Repair Replace the Blower Motor Controller. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*BLOWER MOTOR INOPERATIVE (AZC)

POSSIBLE CAUSES
PDC FUSE #1
BLOWER MOTOR SUPPLY CIRCUIT SHORTED TO GROUND
BLOWER MOTOR SHORTED TO GROUND
BLOWER MOTOR CONTROLLER SHORTRD TO GROUND
CHECK FOR POWER TO THE BLOWER MOTOR CONTROLLER
GROUND CIRCUIT OPEN
BLOWER MOTOR CONTROL CIRCUIT SHORTED TO VOLTAGE
BLOWER MOTOR CONTROL CIRCUIT OPEN
BLOWER MOTOR CONTROLLER OPEN
AUTOMATIC ZONE CONTROL MODULE OPEN
BLOWER MOTOR OPEN
BLOWER MOTOR CONTROLLER OPEN

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Remove and inspect Power Distribution Center (PDC) Fuse #1. Is the fuse open? Yes → Go To 2 No → Go To 5	All
2	Replace PDC Fuse #1. Turn the ignition on. Operate the blower motor in all speeds. Start the engine and operate the AZC system in all modes and speeds. Does the blower motor operate properly without blowing the fuse? Yes → Refer to the wiring diagrams located in the service information to help isolate a possible intermittent short to ground condition. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the Blower Motor Controller harness connector. Measure the resistance between ground and the Blower Motor Supply circuit. Is the resistance below 10K ohms? Yes → Repair the Blower Motor Supply circuit for a short to ground. Replace PDC Fuse #1. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All

*BLOWER MOTOR INOPERATIVE (AZC) — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the Blower Motor Controller harness connector. Disconnect the Blower Motor harness connector. Replace PDC Fuse #1. **CAUTION: Do not allow the jumper wire contacts to touch one another when connecting them to the Blower Motor. Doing so will cause the results of this test will be inaccurate.** Connect a jumper wire between Pin #1 on the Blower Motor and the Blower Motor Supply circuit in the Blower Motor Controller harness connector. Connect a jumper wire between Pin #2 on the Blower Motor and the Ground circuit in the Blower Motor Controller harness connector. Does the Blower Motor operate at full speed without blowing the fuse? Yes → Replace the Blower Motor Controller in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Blower Motor in accordance with the Service Information. Replace PDC Fuse #1. Perform BODY VERIFICATION TEST - VER 1.	All
5	Ensure PDC Fuse #1 is installed. Disconnect the Blower Motor Controller harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Using a 12-volt test light connected to ground, back probe the Blower Motor Supply circuit in the Blower Motor Controller harness connector. Does the test light illuminate brightly? Yes → Go To 6 No → Repair the Blower Motor Supply circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. Disconnect the Blower Motor Controller harness connector. Measure the resistance between ground and the Ground circuit. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
7	Turn the ignition off. Disconnect the Blower Motor Controller harness connector. Disconnect the Automatic Zone Control Module C2 harness connector. Turn the ignition on. Measure the voltage of the Blower Motor Control circuit. Is there any voltage present? Yes → Repair the Blower Motor Control circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Go To 8	All

*BLOWER MOTOR INOPERATIVE (AZC) — Continued

TEST	ACTION	APPLICABILITY
8	Turn the ignition off. Disconnect the Blower Motor Controller harness connector. Disconnect the Automatic Zone Control Module C2 harness connector. Measure the resistance of the Blower Motor Control circuit between the Blower Motor Controller harness connector and the Automatic Zone Control Module C2 harness connector. Is the resistance below 5.0 ohms? Yes → Go To 9 No → Repair the Blower Motor Control circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
9	Turn the ignition off. Make sure that the Blower Motor Controller harness connector is connected to the Blower Motor Controller. Make sure that the Automatic Zone Control Module C2 harness connector is connected to the Automatic Zone Control Module. While back probing, measure the voltage of the Blower Motor Control circuit in the Automatic Zone Control Module C2 harness connector. Is the voltage above 4.0 volts? Yes → Go To 10 No → Replace the Blower Motor Controller in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
10	Turn the ignition off. Reconnect all previous disconnected components. Use the DRB oscilloscope, select Lab Scope and set the following lab scope parameters. Set voltage range to +10.0v. Set probe to X10. Set time to 20ms/Div. Using the oscilloscope lead, back probe the Blower Motor Control circuit at the Blower Motor Controller harness connector. Turn the ignition on. Set the blower switch to LO then slowly move to HI while observing the DRB display. The Scope patten should appear similar to what is provided in the reference material (Section 8.0). The voltage should cycle from approximately 0.5 volts, up to 5.0 volts in the low speed fan position. The duty cycle pattern should change smoothly as the blower switch is turned from LO to HI. The pattern should completely flat line when the blower speed reaches the HI setting. Does the DRB display a duty cycle pattern that changes from approximately 0.5 to 5.0 volts in LO? Yes → Go To 11 No → Replace the Automatic Zone Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. **NOTE: With the DRB, Reset Module after repair/replacement is completed.**	All

*BLOWER MOTOR INOPERATIVE (AZC) — Continued

TEST	ACTION	APPLICABILITY
11	Turn the ignition off. Disconnect the Blower Motor Controller harness connector. Disconnect the Blower Motor harness connector. **CAUTION: Do not allow the jumper wire contacts to touch one another when connecting them to the Blower Motor. Doing so will cause the results of this test will be inaccurate.** Connect a jumper wire between Pin #1 on the Blower Motor and the Blower Motor Supply circuit in the Blower Motor Controller harness connector. Connect a jumper wire between Pin #2 on the Blower Motor and the Ground circuit in the Blower Motor Controller harness connector. Does the Blower Motor operate at full speed? Yes → Replace the Blower Motor Controller in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Blower Motor in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom List:
ABS LAMP CIRCUIT SHORT
AIRBAG LAMP DRIVER FAILURE
BRAKE LAMP CIRCUIT SHORT

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be ABS LAMP CIRCUIT SHORT.

When Monitored and Set Condition:

ABS LAMP CIRCUIT SHORT

When Monitored: 10 seconds after ignition on.

Set Condition: The Instrument Cluster detects a short in the ABS lamp driver circuit.

AIRBAG LAMP DRIVER FAILURE

When Monitored: 10 seconds after ignition on.

Set Condition: The Instrument Cluster detects a short in the Airbag lamp driver circuit.

BRAKE LAMP CIRCUIT SHORT

When Monitored: With the ignition on. (NOTE: The Instrument Cluster can not monitor with parking brake engaged)

Set Condition: The Instrument Cluster detects a short in the Brake indicator driver circuit.

POSSIBLE CAUSES
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	This is an internal cluster failure. If there are no possible causes remaining, view repair. Repair Replace Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom List:
ABS LAMP OPEN
AIRBAG LAMP OPEN
BRAKE LAMP OPEN

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be ABS LAMP OPEN.

When Monitored and Set Condition:

ABS LAMP OPEN

When Monitored: 10 seconds after ignition on.

Set Condition: The Instrument Cluster detects an open in the ABS indicator bulb.

AIRBAG LAMP OPEN

When Monitored: 10 seconds after ignition on

Set Condition: The Instrument Cluster detects an open in the Airbag indicator bulb.

BRAKE LAMP OPEN

When Monitored: With the ignition on. (NOTE: The Instrument Cluster can not monitor while the parking brake is engaged.)

Set Condition: The Instrument Cluster detects an open in the Brake indicator bulb.

POSSIBLE CAUSES
INDICATOR LAMP OPEN
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Remove and inspect the indicator bulb in question. Replace the indicator bulb and socket as necessary. Turn the ignition on. Observe the indicator in question during the bulb check. Did the indicator illuminate? Yes → Clear DTC and verify proper operation. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
ABS MESSAGE NOT RECEIVED BY MIC

When Monitored and Set Condition:

ABS MESSAGE NOT RECEIVED BY MIC

When Monitored: Monitored during ignition on.

Set Condition: The Instrument Cluster detects no ABS messages received for 6 seconds.

POSSIBLE CAUSES
NO RESPONSE - PCI BUS - ABS
INTERMITTENT CONDITION
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, attempt to I/D or communicate with the ABS Module. Is there a response from the ABS Module? Yes → Go To 2 No → Refer to symptom *NO RESPONSE FROM CAB CONTROLLER in the COMMUNICATION category. Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRBIII®, erase the DTC from Instrument Cluster. Cycle the ignition and wait approximately 1 minute. With the DRBIII®, read DTCs. Did this DTC reset? Yes → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → The condition is not present at this time. Monitor DRBIII® parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
ACM MESSAGE NOT RECEIVED BY MIC

When Monitored and Set Condition:

ACM MESSAGE NOT RECEIVED BY MIC

When Monitored: Monitored during ignition on.

Set Condition: No ACM messages received for 6 seconds.

POSSIBLE CAUSES
NO RESPONSE - PCI BUS - ACM
INTERMITTENT CONDITION
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, attempt to I/D or communicate with the ACM. Is there a response from the ACM Module? Yes → Go To 2 No → Refer to symptom *NO RESPONSE FROM ACM in the COMMUNICATION category. Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRBIII®, erase the DTC from Instrument Cluster. Cycle the ignition and wait approximately 1 minute. With the DRBIII®, read DTCs. Did this DTC reset? Yes → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → The condition is not present at this time. Monitor DRBIII® parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
BCM MESSAGES NOT RECEIVED BY MIC

When Monitored and Set Condition:

BCM MESSAGES NOT RECEIVED BY MIC

When Monitored: Monitored during ignition on.

Set Condition: No BCM messages received for 6 seconds.

POSSIBLE CAUSES
NO RESPONSE - PCI BUS - BCM
INTERMITTENT CONDITION
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, attempt to I/D or communicate with the BCM. Is there a response from the Body Control Module? Yes → Go To 2 No → Refer to symptom *BUS +/- SIGNALS OPEN FROM BCM in the COMMUNICATION category Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRBIII®, erase the DTC from Instrument Cluster. Cycle the ignition and wait approximately 1 minute. With the DRBIII®, read DTCs. Did this DTC reset? Yes → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → The condition is not present at this time. Monitor DRBIII® parameters while wiggling the related wire harness. Refer to any Techinical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
CHECKSUM FAILURE

When Monitored and Set Condition:

CHECKSUM FAILURE

When Monitored: With the ignition on.

Set Condition: The Instrument Cluster detects EEPROM failure during the internal self check.

POSSIBLE CAUSES
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase DTCs. Cycle the ignition and wait approximately 1 minute. With the DRBIII®, read DTCs. Did this DTC reset? Yes → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
EATX MESSAGE STATUS

POSSIBLE CAUSES
INTERMITTENT CONDITION
NO RESPONSE - PCI BUS - EATX
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, attempt to I/D or communicate with the EATX. Is there a response from the Transmission Control Module? Yes → Go To 2 No → Refer to symptom *NO RESPONSE FROM TRANSMISSION CONTROL MODULE in the COMMUNICATION category. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition on. With the DRBIII®, erase DTCs. Cycle the ignition and wait approximately 1 minute. With the DRBIII®, read DTCs. Did this DTC reset? Yes → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → The condition is not present at this time. Monitor DRBIII® parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
NO PCI BUS COMMUNICATION

POSSIBLE CAUSES
NO RESPONSE - PCI BUS
INTERMITTENT CONDITION
NO RESPONSE - PCI BUS - INSTRUMENT CLUSTER
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. **NOTE: When the Instrument Cluster detects no PCI Bus, the VF will display ″no bus″.** With the DRBIII®, attempt to communicate with other modules on the PCI Bus. Was the DRBIII® able to communicate with other modules? Yes → Go To 2 No → Refer to the COMMUNICATION category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition on. With the DRBIII®, select System Monitors, then J1850 Module Scan. Does the DRBIII® display MIC PRESENT on the BUS? Yes → Go To 3 No → Refer to symptom ″No Response from Instrument Cluster in the Communication″ category. Perform BODY VERIFICATION TEST - VER 1.	All
3	With the DRBIII®, erase DTCs. Cycle the ignition and wait approximately 1 minute. With the DRBIII®, read DTCs. Did this DTC reset? Yes → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → The condition is not present at this time. Monitor DRBIII® parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
PCM MESSAGE NOT RECEIVED BY MIC

When Monitored and Set Condition:

PCM MESSAGE NOT RECEIVED BY MIC

When Monitored: With the ignition on.

Set Condition: The Instrument Cluster detects no PCM bus messages received for 6 seconds.

POSSIBLE CAUSES
NO RESPONSE - PCI BUS - PCM
INTERMITTENT CONDITION
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, select Body Controller and system test. Does the DRB display PCM active on the bus? Yes → Go To 2 No → Refer to symptom *NO RESPONSE FROM PCM (PCI BUS) in the COMMUNICATION category. Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRBIII®, erase the DTC from Instrument Cluster. Cycle the ignition and wait approximately 1 minute. With the DRBIII®, read DTCs. Did this DTC reset? Yes → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → The conditionis not present at this time. Monitor DRBIII® parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Wisually inspect the related wiring harness and connector terminals. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
SKIM MESSAGE NOT RECEIVED BY MIC

When Monitored and Set Condition:

SKIM MESSAGE NOT RECEIVED BY MIC

When Monitored: Monitored during ignition on.

Set Condition: No SKIM messages received for 6 seconds.

POSSIBLE CAUSES
NO RESPONSE - PCI BUS - SKIM
INTERMITTENT CONDITION
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, select THEFT ALARM, then SKIM. Is there a response from the SKIM Module? Yes → Go To 2 No → Refer to symptom BUS +/- SIGNALS OPEN FROM SKIM in the COMMUNICATIONS category. Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRBIII®, erase the DTC from Instrument Cluster. Cycle the ignition and wait approximately 1 minute. With the DRBIII®, read DTCs. Did this DTC reset? Yes → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → The condition is not present at this time. Monitor DRBIII® parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*AIRBAG INDICATOR NOT OPERATING PROPERLY

POSSIBLE CAUSES
ACM DTC PRESENT
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	Turn the ignition from the Lock to the Run position. This will start the Airbag bulb check. Did the Airbag indicator illuminate? Yes → Go To 2 No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRBIII®, read DTCs. Are there any Airbag or Instrument Cluster DTCs present? Yes → Refer to symptom list for problems related to Airbag or Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
*ALL GAUGES INOPERATIVE

POSSIBLE CAUSES
FUSED B(+) CIRCUIT SHORT TO GROUND
FUSED IGNITION SWITCH OUTPUT CIRCUIT SHORT TO GROUND
GROUND CIRCUIT OPEN
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure there is PCI Bus Communication with the Instrument Cluster, PCM and BCM before proceeding with this test.** Turn the ignition off. Remove and inspect the Junction Block Fuse #17. If the fuse is open, replace with proper rated fuse. Turn the ignition on and wait approximately 1 minute. Turn the ignition off. Remove and inspect the Junction Block Fuse #17. Is the fuse open? Yes → Go To 2 No → Go To 3	All
2	Turn the ignition off. Remove the Junction Block Fuse #17 Disconnect the Instrument Cluster harness connector. Measure the resistance between ground and the Fused B(+) circuit. Is the resistance below 100 ohms? Yes → Repair the fused B(+) circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Remove and inspect the Junction Block Fuse #22. If the fuse is open, replace with proper rated fuse. Turn the ignition on and wait approximately 1 minute. Turn the ignition off. Remove and inspect the Junction Block Fuse #22. Is the fuse open? Yes → Go To 4 No → Go To 5	All

*ALL GAUGES INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the Instrument Cluster harness connector. Measure the resistance between ground and the Fused Ignition Switch Output circuit. Is the resistance below 100 ohms? Yes → Repair the Fused Ignition Switch Output circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Turn all interior and exterior lights off. Disconnect the Instrument Cluster harness connector. Close all vehicle doors. Measure the resistance of both Instrument Cluster Ground circuits. Was the resistance in either ground circuit above 5.0 ohms? Yes → Repair the Instrument Cluster Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*BRAKE INDICATOR INOPERATIVE

POSSIBLE CAUSES
BRAKE FLUID LEVEL SWITCH
PARK BRAKE SWITCH
RED BRAKE WARNING INDICATOR DRIVER CIRCUIT OPEN
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Diagnose and repair any Brake, MIC, or Communication DTCs before proceeding with this test.** Is the BRAKE indicator only inoperative with the Park Brake engaged? Yes → Go To 2 No → Replace the Brake Fluid Level Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
2	Disconnect the Park Brake Switch harness connector. Connect a jumper wire between the Red Brake Warning Indicator Driver circuit and ground. Turn the ignition on. Observe the BRAKE indicator. Did the BRAKE indicator illuminate? Yes → Replace the Park Brake Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the Park Brake Switch harness connector. Disconnect the Instrument Cluster harness connector. Measure the resistance of the Red Brake Warning Indicator Driver circuit. Is the resistance above 5.0 ohms? Yes → Repair the Red Brake Warning Indicator Driver circuit for an open. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*BRAKE WARNING INDICATOR ALWAYS ON

POSSIBLE CAUSES
DTC PRESENT
RED BRAKE WARNING INDICATOR SWITCH
RED BRAKE WARNING INDICATOR DRIVER CIRCUIT SHORT TO GROUND
PARK BRAKE SWITCH
PARK BRAKE - RED BRAKE WARNING INDICATOR DRIVER CIRCUIT SHORT TO GROUND
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that the Brake Fluid Level is properly filled and the Brake Fluid Level Switch harness connector is properly connected.** With the DRBIII®, erase DTCs. Cycle the ignition and wait approximately 15 seconds. With the DRBIII®, read DTCs. Does the DRBIII® display any Brake or MIC Indicator DTCs? Yes → Refer to symptom list for problems related to BRAKE FLUID LEVEL SWITCH CIRCUIT or BRAKE LAMP DTCs. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the Brake Fluid Level Switch harness connector. Measure the resistance of the Red Brake Warning Indicator Switch between pin 1 and pin 2. Is the resistance below 100 ohms? Yes → Replace the Red Brake Warning Indicator (Fluid Level) Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the Red Brake Warning Indicator (Fluid Level) Switch harness connector. Disconnect the CAB harness connector. Measure the resistance between ground and the Red Brake Warning Indicator Driver circuit. Is the resistance below 5.0 ohms? Yes → Repair the Red Brake Warning Indicator Driver circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All

*BRAKE WARNING INDICATOR ALWAYS ON — Continued

TEST	ACTION	APPLICABILITY
4	**NOTE: Ensure that the Brake Fluid Level Switch and Instrument Cluster harness connectors are properly connected.** Disconnect the Park Brake Switch harness connector. With the DRBIII® in Inputs/Outputs, read the Park Brake Switch state. Does the DRBIII® display ″Open″? Yes → Replace the Park Brake Switch in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Disconnect the Park Brake Switch harness connector. Disconnect the Instrument Cluster harness connector. Measure the resistance between ground and the Park Brake Switch Sense circuit. Is the resistance below 5.0 ohms? Yes → Repair the Park Brake - Red Brake Warning Indicator Driver circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*CHECK ENGINE INDICATOR NOT OPERATING PROPERLY

POSSIBLE CAUSES
DTC PRESENT
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	Turn the ignition from the Lock to the Run position. This will start the MIL indicator bulb check. Did the Check Engine indicator illuminate for approximately 4 seconds and then go out? Yes → Go To 2 No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
2	Using the DRB read ENGINE DTC's. Are there any PCM DTC's present? Yes → Refer to symptom list for problems related to DRIVEABILITY. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
*CHECK GAUGES INDICATOR INOPERATIVE

POSSIBLE CAUSES
DTC PRESENT
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	Turn the ignition from the Lock to the Run position. This will start the MIL bulb check. Did the Check Engine indicator illuminate for approximately 4 seconds and then go out? No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. Yes → Go To 2	All
2	Ensure that the engine temperature, oil pressure, and battery voltage are operating properly before proceeding with this test. With the DRBIII®, read ENGINE DTC's. Are there any PCM DTC's present? Yes → Refer to symptom list for problems related to DRIVEABILITY. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
*COOLANT LEVEL INDICATOR INOPERATIVE - DIESEL ONLY

POSSIBLE CAUSES
COOLANT LEVEL SENSOR
GROUND CIRCUIT OPEN
COOLANT LEVEL SWITCH SENSE CIRCUIT OPEN
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Disconnect the Coolant Level Sensor harness connector. **Note: Check connectors - Clean/repair as necessary.** Turn the ignition on. With the DRB enter Body, Body Computer, then Sensors. Connect a jumper wire between the Coolant Level Switch Sense circuit and the Ground circuit. With the DRB observe the Coolant Level Sw voltage. Does the DRB display voltage at 0.0 volt? Yes → Replace the Coolant Level Sensor. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the Coolant Level Sensor harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the Sensor Ground circuit. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the Coolant Level Sensor Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Disconnect the Coolant Level Sensor harness connector. Disconnect the BCM C2 harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the Coolant Level Switch Sense circuit between the Coolant Level Sensor harness connector and the BCM C2 harness connector. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Coolant Level Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*CRUISE ON INDICATOR NOT OPERATING PROPERLY

POSSIBLE CAUSES
DTC PRESENT
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read engine DTC's. Are there any PCM DTC's present? Yes → Refer to the Driveability category for the related symptom(s) involving the Speed Control System. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Ensure there is communication with the Instrument Cluster, PCM and the ABS modules before proceeding with this test. Perform the Instrument Cluster Self Test. The self test can be performed with the DRBIII® or manually using the following procedure: Turn the ignition off. Press and hold the Trip Reset button. Turn the ignition on. **NOTE: The Cruise indicator in the PRNDL should illuminate for approximately 5 seconds during the self test.** Did the Cruise indicator illuminate for approximately 3 to 6 seconds? Yes → Test Complete. No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*FUEL GAUGE NOT OPERATING PROPERLY

POSSIBLE CAUSES
INSTRUMENT CLUSTER
FUEL LEVEL SENSOR

TEST	ACTION	APPLICABILITY
1	**NOTE: Diagnose and repair any PCM or Communication DTCs before proceeding with this test.** Perform the Instrument Cluster Self Test. The self test can be performed with the DRBIII® or manually using the following procedure: Turn the ignition off. Press and hold the Trip Reset button. Turn the ignition on. Observe the Fuel gauge during the self test. The Fuel gauge should position the indicator needle at the following calibration points: Empty Stop Empty 1/2 Full Full Stop Did the Fuel gauge position at the proper calibration points? Yes → Refer to the Service Information for problems related to the Fuel Sending Unit. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*HIGH BEAM INDICATOR INOPERATIVE

POSSIBLE CAUSES
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that the Exterior High Beam Headlamps operate properly before proceeding with this test.** **NOTE: Ensure that there is communication between the Instrument Cluster and the BCM before proceeding with this test.** Perform the Instrument Cluster Self Test. The self test can be performed with the DRBIII®, or manually using the following procedure: Turn the ignition off. Press and hold the Trip Reset button. Turn the ignition on. Observe the High Beam indicator during the Self Test. Did the High Beam indicator illuminate for approximately 4 seconds and then turn off? Yes → Test Complete. No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*INSTRUMENT CLUSTER DIMMING INOPERATIVE

POSSIBLE CAUSES
DTC PRESENT
ILLUMINATION BULB OR SOCKET
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure there is communication with the Instrument Cluster and the BCM before proceeding with this test.** With the DRBIII®, read BCM DTCs. Does the DRBIII® display any DTCs? Yes → Refer to symptom list for problems related to the Interior Lighting category. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Remove the Instrument Cluster. Remove and check any inoperative illumination bulbs and sockets. Do the bulbs and sockets check okay? Yes → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Replace the illumination bulb or socket as necessary in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*LOW COOLANT INDICATOR ALWAYS ON - DIESEL ONLY

POSSIBLE CAUSES
COOLANT LEVEL SENSOR
COOLANT LEVEL SENSE CIRCUIT SHORT TO GROUND
BODY CONTROL MODULE
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that the cooling system is correctly filled and operating properly before proceeding with this test.** Disconnect the Coolant Level Switch harness connector. Turn the ignition on. With the DRBIII® in Body Controls, read the Coolant Level SW voltage. Does the DRBIII® display voltage above 4.8 ? Yes → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Coolant Level Sensor harness connector. **Note: Check connectors - Clean/repair as necessary.** Turn the ignition on. With the DRBIII®, read the Coolant Level Sw voltage. Does the DRBIII® display voltage above 4.8 ? Yes → Replace the Coolant Level Sensor. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the Coolant Level Sensor harness connector. Disconnect the Body Control Module C2 harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the Coolant Level Switch Sense circuit. Is the resistance below 100.0 ohms? Yes → Repair the Coolant Level Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*LOW FUEL INDICATOR INOPERATIVE

POSSIBLE CAUSES
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	**NOTE: The Low Fuel indicator is activated by the MIC using fuel data received from the PCM and Fuel Gauge needle position.** **NOTE: Ensure that MIC and PCM communications and the Fuel Gauge operate properly before proceeding with this test.** Perform the Instrument Cluster Self Test. The self test can be performed with the DRBIII® or manually using the following procedure: Turn the ignition off. Press and hold the Trip Reset button. Turn the ignition on. Observe the Low Fuel indicator during the Self Test. Did the Low Fuel indicator illuminate for approximately 4 seconds and then turn off? Yes → Test Complete. No → Replace the Instrument Cluster in accordance with the Service Information.. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*O/D OFF INDICATOR INOPERATIVE

POSSIBLE CAUSES
MIC SELF TEST
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	Perform the Instrument Cluster Self Test. The self test can be performed with the DRBIII® or manually using the following procedure: Turn the ignition off. Press and hold the Trip Reset button. Turn the ignition on. Observe the O/D OFF indicator during the Self Test. Did the O/D OFF indicator illuminate for approximately 4 seconds and then turn off? No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. Yes → Refer to Transmission Diagnostic information for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*OIL PRESSURE GAUGE NOT OPERATING PROPERLY

POSSIBLE CAUSES
DTC PRESENT
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	**NOTE: With the DRBIII®, read Powertrain DTC's. If any Oil Pressure Sensor Volts codes are present, refer to symptom list for problems related to Driveability.** Perform the Instrument Cluster Self Test. The self test can be performed with the DRBIII® or manually using the following procedure: Turn the ignition off. Press and hold the Trip Reset button. Turn the ignition on. The Oil Pressure Gauge should position the indicator needle at the following calibration points: 40 Psi 60 Psi 80 Psi LOW Psi Observe the Oil Pressure Gauge during the self test. Did the Oil Pressure Gauge operate correctly during the self test? Yes → Refer to Driveability Diagnostic information for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1. No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*SEAT BELT INDICATOR INOPERATIVE

POSSIBLE CAUSES
SEAT BELT SWITCH GROUND OPEN
SEAT BELT SWITCH
SEAT BELT SWITCH SENSE CIRCUIT OPEN
JUNCTION BLOCK SEATBELT SWITCH SENSE CIRCUIT OPEN
INSTRUMENT CLUSTER
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition from the Off position to the Run position and observe the bulb check. Did the Seat Belt indicator illuminate? Yes → Go To 2 No → Replace the Instrument Cluster in accordance with the Service Information.. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Seat Belt Switch harness connector. Measure the resistance of the Seat Belt Switch ground circuit. Is the resistance above 5.0 ohms? Yes → Repair the Seat Belt Switch Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition on. Disconnect the Seat Belt Switch harness connector. Connect a jumper wire between the Seatbelt Switch Sense circuit and ground. With the DRBIII® in Body Computer Inputs/Outputs read the Seat Belt SW state. Does the DRBIII® display SEAT BELT SW: CLOSED? Yes → Replace the Seat Belt buckle in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Disconnect the Seat Belt Switch harness connector. Disconnect the Junction Block C1 harness connector. Measure the resistance of the Seat Belt Switch Sense circuit. Is the resistance above 5.0 ohms? Yes → Repair the Seatbelt Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All

*SEAT BELT INDICATOR INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
5	Turn the ignition off. Remove the Body Control Module from the Junction Block. Disconnect the Junction Block C1 connector. Measure the resistance of the Junction Block Seat Belt Switch Sense circuit. Is the resistance above 5.0 ohms? Yes → Replace the Junction Block in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*SEATBELT INDICATOR ALWAYS ON

POSSIBLE CAUSES
SEAT BELT SWITCH
BCM
SEAT BELT SWITCH SENSE CIRCUIT SHORT TO GROUND
JUNCTION BLOCK SEAT BELT SWITCH SENSE CIRCUIT SHORT TO GROUND
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	Buckle the Seat Belt. Turn the ignition on. With the DRBIII® in Body Computer Inputs/Outputs, read the Seat Belt SW state. Does the DRBIII® display Seat Belt SW: OPEN? Yes → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Seat Belt Switch harness connector. Turn the ignition on. Does the DRBIII® display Seat Belt SW: OPEN? Yes → Replace the Seat Belt Buckle in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the Junction Block C1 harness connector. Disconnect the Seat Belt Switch harness connector. Measure the resistance between ground and the Seat Belt Switch Sense circuit. Is the resistance below 5.0 ohms? Yes → Repair the Seat Belt Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Remove the Body Control Module from the Junction Block. Disconnect the Junction Block C1 harness connector. Measure the resistance between ground and the Seat Belt Switch Sense circuit at the Junction Block. Is the resistance below 5.0 ohms? Yes → Replace the Junction Block in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*SKIM INDICATOR INOPERATIVE

POSSIBLE CAUSES
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Diagnose and repair any SKIM or Communication DTCs before proceeding with this test.** Turn the ignition from the Off position to the Run position and observe the bulb check. Did the Skim indicator illuminate briefly and then turn off? No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. Yes → Test Complete.	All

Symptom:
*SPEEDOMETER NOT OPERATING PROPERLY

POSSIBLE CAUSES
ABS TIRE PROGRAMMING
SPEEDOMETER INPUT - PROBLEM
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Diagnose any PCM or Communication DTCs before proceeding with this test.** **NOTE: Ensure that the ABS module is programmed with the correct tire size.** Perform the Instrument Cluster Self Test using the DRBIII®, or manually using the following procedure: Turn the ignition off. Press and hold the Trip Reset button. Turn the ignition on. The Speedometer should position the indicator needle at the following calibration points: 0 MPH 20 MPH (25 MPH - UK) (40 Km/H) 55 MPH (50 MPH - UK) (80 Km/H) 75 MPH (75 MPH - UK) (120 Km/H) 110 MPH (110 MPH - UK) (230 Km/H) (200 Km/H AUS/JAPAN) Did the Speedometer operate correctly during the self test? Yes → Go To 2 No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRBIII®, verify that the ABS Tire Size is correctly programmed. Is the Tire Size programmed correctly? Yes → Refer to Powertrain Diagnostic information for the releated symptom(s). Perform BODY VERIFICATION TEST - VER 1. No → Using the Diagnostic (Transmission, or Chassis)/Service Manual Information as a guide, program the correct tire size and then verify that the Speedometer is working. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*TACHOMETER NOT OPERATING PROPERLY

POSSIBLE CAUSES
INTERMITTENT CONDITION
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Diagnose and repair any PCM or Communication DTCs before proceeding with this test.** Perform the Instrument Cluster Self Test. The self test can be performed using the DRBIII® or manually using the following procedure: Turn the ignition off. Press and hold the Trip Reset button. Turn the ignition on. Observe the Tachometer during the self test. The Tachometer should position the indicator needle at the following calibration points: 0 RPM 800 RPM 3000 RPM (2500 RPM Diesel) 7000 RPM (6000 RPM Diesel) Did the Tachometer position at the proper calibration points? Yes → The condition is not present at this time. Monitor DRBIII® parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*TEMPERATURE GAUGE INOPERATIVE

POSSIBLE CAUSES
INTERMITTENT CONDITION
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that the cooling system operates properly before proceeding with this test.** **NOTE: Diagnose and repair any PCM, MIC, BCM, or Communication DTCs before proceeding with this test.** Perform the Instrument Cluster self test. The self test can be performed manually or with using the DRBIII®. Turn the ignition off. Press and hold the Trip Reset button. Turn the ignition on. Observe the Temperature gauge during the self test. The Temperature gauge should position the indicator needle at the following calibration points: 40°C (100°F) 100°C (210°F) 122°C (250°F) Temp High Temp Critical Did the Temperature gauge indicate the proper calibration points? Yes → The condition is not present at this time. Monitor DRBIII® parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*TRANS OVER TEMP INDICATOR INOPERATIVE

POSSIBLE CAUSES
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Diagnose and repair any Transmission, PCM, or Communication DTCs before proceeding with this test.** Perform the Instrument Cluster Self Test. The self test can be performed with the DRBIII® or manually using the following procedure: Turn the ignition off. Press and hold the Trip Reset button. Turn the ignition on. Observe the Trans Over Temp indicator during the self test. Did the Trans Temp indicator illuminate for approximately 4 seconds then turn off? Yes → Test Complete. No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*VOLTMETER INOPERATIVE

POSSIBLE CAUSES
INTERMITTENT CONDITION
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Diagnose and repair any Charging System faults or PCM DTCs before proceeding with this test.** **NOTE: Ensure that there is communication with the Instrument Cluster and the PCM before proceeding with this test.** Perform the Instrument Cluster Self Test. The self test can be performed manually or using the DRBIII®. Turn the ignition off. Press and hold the Trip Reset button. Turn the ignition on. Observe the Voltmeter during the self test. The Voltmeter should position the indicator needle at the following calibration points: 9 Volts 14 Volts 16 Volts Did the Voltmeter position the indicator needle at the proper calibration points? Yes → The condition is not present at this time. Monitor DRBIII® parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*WATER IN FUEL INDICATOR PROBLEMS - DIESEL ONLY

POSSIBLE CAUSES
INSTRUMENT CLUSTER
POWERTRAIN FAULT CONDITION

TEST	ACTION	APPLICABILITY
1	Turn the ignition from the Off position to the Run position. Observe the Water In Fuel indicator during the bulb check. Did the Water In Fuel indicator illuminate briefly and then turn off? Yes → Refer to the Powertrain Diagnostic information for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1. No → Replace the Instrument Cluster in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
DIM SW SHORT TO GROUND

When Monitored and Set Condition:

DIM SW SHORT TO GROUND

When Monitored: Ignition in RUN and IOD fuse/connector installed.

Set Condition: The voltage of the Panel Lamps Dimmer Signal circuit has gone below 0.3 volts for 5 seconds.

POSSIBLE CAUSES
LEFT MULTIFUNCTION SWITCH SHORTED
PANEL LAMPS DIMMER SIGNAL CIRCUIT SHORT TO GROUND
HEADLAMP SWITCH RETURN CIRCUIT SHORT TO GROUND
BCM

TEST	ACTION	APPLICABILITY
1	Disconnect the Left Multifunction switch connector. Turn ignition on. With the DRBIII® in Sensors, read the Panel Lamp voltage. Is the voltage below 4.0 volts? Yes → Go To 2 No → Replace the Left Multifunction switch. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn ignition off. Disconnect the Left Multi-function switch connector. Disconnect the Body Control Module C1 connector. Measure the resistance of the Panel Lamps Dimmer Signal circuit to a known good ground. Is the resistance below 1000 (1K)ohms? Yes → Repair the Panel Lamps Dimmer Signal circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn ignition off. Disconnect the Left Multi-function switch connector. Disconnect the Body Control Module C1 connector. Measure the resistance of the Headlamp Switch Return circuit to a known good ground. Is the resistance below 1000 (1K)ohms? Yes → Repair the Headlamp Switch Return circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All

DIM SW SHORT TO GROUND — Continued

TEST	ACTION	APPLICABILITY
4	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
DIMMER SWITCH OPEN CIRCUIT

When Monitored and Set Condition:

DIMMER SWITCH OPEN CIRCUIT

When Monitored: Ignition in RUN and IOD fuse/connector installed.

Set Condition: Any time the voltage on the Panel Lamps Dimmer Signal circuit exceeds 4.8 volts for 5 seconds.

POSSIBLE CAUSES
PANEL LAMP DIMMER SWITCH
PANEL LAMPS DIMMER SIGNAL CIRCUIT OPEN
HEADLAMP SWITCH RETURN OPEN
BCM

TEST	ACTION	APPLICABILITY
1	Turn ignition off. Disconnect the Left Multifunction switch connector. Connect a jumper wire between Panel Lamp Dimmer Signal circuit and Headlamp Switch Return. Turn the ignition on. With the DRBIII® in Sensors, read the Panel Lamps voltage. Does the DRBIII® display Panel Lamp voltage below 0.5 volts ? Yes → Replace the Left Multifunction switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn ignition off. Disconnect the Left Multi-function switch connector. Disconnect the Body Control Module C1 connector. Using an ohmmeter measure the Panel Lamps Dimmer Signal circuit from the BCM C1 connector to the left multi-function switch connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open Panel Lamps Dimmer Signal circuit. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn ignition off. Disconnect the Left Multi-function switch connector. Disconnect the Body Control Module C1 connector. Using an ohmmeter measure the Headlamp Switch Return circuit from BCM to Left Multi-function. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open headlamp switch return circuit. Perform BODY VERIFICATION TEST - VER 1.	All

DIMMER SWITCH OPEN CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
4	If there are no possible causes remaining, view repair Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:

LAMP FADE FAILURE SHORT TO BATTERY

When Monitored and Set Condition:

LAMP FADE FAILURE SHORT TO BATTERY

When Monitored: Ignition in RUN and IOD fuse/connector installed.

Set Condition: The BCM has detected a short to battery on either the Courtesy Lamp Driver circuit or the Courtesy Lamp Control circuit for 5 seconds.

POSSIBLE CAUSES
SHORTED COURTESY LAMP BULB
COURTESY LAMP CONTROL CIRCUIT SHORTED TO BATTERY
COURTESY LAMP DRIVER CIRCUIT SHORTED TO BATTERY
BCM, COURTESY LAMP CIRCUIT

TEST	ACTION	APPLICABILITY
1	**Note: Repeat this test for each of the following bulbs before proceeding to the next test: Instrument Panel Courtesy (2), Rear Reading (2), Front Overhead (2), and Liftgate.** Turn ignition off. Remove one of the bulbs listed in the previous pop up message. Note: after this test leave the bulb out. Turn ignition on. Using the DRB erase all BCM DTC's. Using the DRB read BCM DTC's. Is the ″Lamp Fade Failure Short to battery″ DTC present? Yes → Go To 2 No → Replace bulb, and reinstall all other bulbs removed during testing. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn ignition off. Remove fuse # 8 from the Junction Block. Disconnect the BCM C1 connector. Turn ignition on. Measure the voltage of the Courtesy Lamp Control circuit in the BCM C1 connector. Is there any voltage? Yes → Repair the Courtesy Lamp Control circuit for a short to battery and reinstall all bulbs removed during testing. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

LAMP FADE FAILURE SHORT TO BATTERY — Continued

TEST	ACTION	APPLICABILITY
3	Turn ignition off. Disconnect Fuse # 8. Disconnect the Junction Block C1 Connector. Turn ignition on. Measure the voltage of the Courtesy Lamp Driver circuit in the Junction Block C1 connector (cav 16). Is there any voltage? Yes → Repair the Courtesy Lamp Driver circuit for a short to battery and reinstall all bulbs removed during testing. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module (BCM) and reinstall all bulbs removed durning testing. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
LOAD SHED FAILURE SHORT TO BATTERY

When Monitored and Set Condition:

LOAD SHED FAILURE SHORT TO BATTERY

When Monitored: Ignition in RUN and IOD fuse/connector installed

Set Condition: The BCM has detected a short to battery on the Interior Load Shed circuit for 5 seconds

POSSIBLE CAUSES
SHORTED GLOVE BOX LAMP BULB
INTERIOR LAMP LOAD SHED CONTROL SHORT TO BATTERY (COURTESY)
INTERIOR LAMP LOAD SHED CONTROL SHORT TO BATTERY (GLOVE BOX)
BCM, INTERIOR LAMP LOAD SHED CONTROL

TEST	ACTION	APPLICABILITY
1	Turn ignition off. Remove the Glove Box lamp bulb. Turn ignition on. Using the DRB erase all BCM DTC's. Using the DRB read BCM DTC's. Is the "Load Shed Failure Short to battery" DTC present? Yes → Go To 2 No → Replace bulb. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn ignition off. Ensure the Glove Box is closed with the Lamp switch in the off position. Disconnect the BCM C1 connector. Turn ignition on. Measure the voltage of the Interior Lamp Load Shed Control circuit in the C1 connector. Is there any voltage? Yes → Repair the Interior Lamp Load Shed Control circuit for a short to battery. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

LOAD SHED FAILURE SHORT TO BATTERY — Continued

TEST	ACTION	APPLICABILITY
3	Turn ignition off. Ensure all of the Overhead, Rear Reading and Vanity Lamp Switches are in the off position. Disconnect the Junction Block C-1 connector. Turn ignition on. Measure the voltage of the Interior Lamp Load Shed Control circuit in the J/B C1 connector. Is there any voltage? Yes → Repair the Interior Lamp Load Shed Control circuit for a short to battery. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module (BCM). Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
PANEL LAMP DRIVER FAILURE

When Monitored and Set Condition:

PANEL LAMP DRIVER FAILURE

When Monitored: Ignition in RUN and IOD fuse/connector installed.

Set Condition: This condition is set if the panel lamp driver that illuminates the I/P shuts down from an over temp condition for at least 5 seconds.

POSSIBLE CAUSES
DRIVER HEATED SEAT SWITCH SHORTED TO GROUND
PASSENGER HEATED SEAT SWITCH SHORTED TO GROUND
HVAC CONTROL PANEL SHORTED TO GROUND
PRNDL ILLUMINATION SHORTED TO GROUND
ASH RECEIVER BULB OR SOCKET SHORTED TO GROUND
RADIO SHORTED TO GROUND
PANEL LAMPS DRIVER CIRCUIT SHORTED TO GROUND (HVAC)
PANEL LAMPS DRIVER CIRCUIT SHORTED TO GROUND (PRNDL)
PANEL LAMPS DRIVER CIRCUIT SHORTED TO GROUND (RADIO)
PANEL LAMPS DRIVER CIRCUIT SHORTED TO GROUND (ASH RECEIVER)
PANEL LAMPS DRIVER CIRCUIT SHORTED TO GROUND (HEATED SEATS)
BCM, PANEL LAMP DRIVER FAILURE

TEST	ACTION	APPLICABILITY
1	Turn ignition off. Disconnect the Drivers Heated Seat Switch. Turn ignition on. Erase Body Diagnostic Trouble Codes. Wait 5 seconds then read BCM DTC's. Is the "Panel Lamps Driver" DTC present? Yes → Go To 2 No → Replace the drivers heated seat switch. Perform BODY VERIFICATION TEST - VER 1.	All

PANEL LAMP DRIVER FAILURE — Continued

TEST	ACTION	APPLICABILITY
2	Turn ignition off. Disconnect the Passengers Heated Seat Switch. Turn ignition on. Erase Body Diagnostic Trouble Codes. Wait 5 seconds then read BCM DTC's. Is the ″Panel Lamps Driver″ DTC present? Yes → Go To 3 No → Replace the Passenger Heated Seat Switch. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn ignition off. Disconnect the appropriate HVAC Control panel connector. C-1 for manual or C-2 for automatic system. Turn ignition on. Erase Body Diagnostic Trouble Codes. Wait 5 seconds then read BCM DTC's. Is the ″Panel Lamps Driver″ DTC present? Yes → Go To 4 No → Replace the HVAC Control panel assemble. Perform BODY VERIFICATION TEST - VER 1.	All
4	Turn ignition off. Disconnect the PRNDL/Transfer Case Illumination connector. Turn ignition on. Erase Body Diagnostic Trouble Codes. Wait 5 seconds then read BCM DTC's. Is the ″Panel Lamps Driver″ DTC present? Yes → Go To 5 No → Repair or replace the shorted PRNDL/Transfer Case Illumination. Perform BODY VERIFICATION TEST - VER 1.	All
5	Turn ignition off. Disconnect the ash receiver. Turn ignition on. Erase Body Diagnostic Trouble Codes. Wait 5 seconds then read BCM DTC's. Is the ″Panel Lamps Driver″ DTC present? Yes → Go To 6 No → Repair the ash receiver bulb or socket for a short to ground. Perform BODY VERIFICATION TEST - VER 1.	All
6	Turn ignition off. Disconnect the radio C1 connector. Turn ignition on. Erase Body Diagnostic Trouble Codes. Wait 5 seconds then read BCM DTC's. Is the ″Panel Lamps Driver″ DTC present? Yes → Go To 7 No → Repair or replace the Radio. Perform BODY VERIFICATION TEST - VER 1.	All

PANEL LAMP DRIVER FAILURE — Continued

TEST	ACTION	APPLICABILITY
7	Turn ignition off. Disconnect the appropriate HVAC Control panel connector. C-1 for manual or C-2 for automatic system. Disconnect the BCM (Body Control Module) C1 connector. Measure the resistance of the Panel Lamps Driver circuit in the BCM C1 connector (cav. 10). Is the resistance below 5.0 ohms? Yes → Repair the Panel Lamp Driver circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 8	All
8	Turn ignition off. Disconnect the PRNDL/Transfer Case Illumination connector. Disconnect the BCM (Body Control Module) C1 connector. Measure the resistance of the Panel Lamps Driver circuit in the BCM C1 connector (cav. 9). Is the resistance below 5.0 ohms? Yes → Repair the Panel Lamp Driver circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 9	All
9	Turn ignition off. Disconnect the radio C1 connector. Disconnect the BCM (Body Control Module) C1 connector. Measure the resistance of the Panel Lamps Driver circuit in the BCM C1 connector (cav. 13). Is the resistance below 5.0 ohms? Yes → Repair the Panel Lamp Driver circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 10	All
10	Turn ignition off. Disconnect the ash receiver lamp. Disconnect the BCM (Body Control Module) C1 connector. Measure the resistance of the Panel Lamps Driver circuit in the BCM C1 connector (cav. 8). Is the resistance below 5.0 ohms? Yes → Repair the Panel Lamp Driver circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 11	All
11	Turn ignition off. Disconnect the driver and passenger heated seat switches. Disconnect the BCM (Body Control Module) C1 connector. Measure the resistance of the Panel Lamps Driver circuit in the BCM C1 connector (cav. 12). Is the resistance below 5.0 ohms? Yes → Repair the Panel Lamp Driver circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 12	All

PANEL LAMP DRIVER FAILURE — Continued

TEST	ACTION	APPLICABILITY
12	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*ALL COURTESY LAMPS INOPERATIVE

POSSIBLE CAUSES
FUSE #8 BLOWN CIRCUIT NOT SHORTED
FUSED B+ CIRCUIT OPEN
FUSED B+ CIRCUIT SHORTED TO GROUND
BCM

TEST	ACTION	APPLICABILITY
1	Turn ignition off. Remove and inspect fuse #8. Is the fuse blown? Yes → Go To 2 No → Go To 3	All
2	Turn ignition off. Remove fuse #8 from the Junction Block. Measure the resistance of the Fused B+ circuit (upper cavity of fuse #8) to a known good ground. Is the resistance below 5.0 ohms? Yes → Repair the Fused B+ circuit for a short to ground and replace the blown fuse. Perform BODY VERIFICATION TEST - VER 1. No → Replace blown fuse #8. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn ignition off. Remove fuse #8 from the Junction Block. Remove the driver's side rear seat overhead reading lamp lens cover. Measure the resistance of the Fused B+ circuit between Fuse #8 (top cavity) and the Rear Passenger's overhead reading lamp (Fused B+ side). Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the Fused B+ circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
4	If there are no possible causes remaining, view repair. Repair Replace BCM (Body Control Module). Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*ASH TRAY LAMP INOPERATIVE

POSSIBLE CAUSES
BCM DTC
ASH RECEIVER BULB OPEN
OPEN GROUND CIRCUIT
PANEL LAMPS DRIVER CIRCUIT OPEN
BCM

TEST	ACTION	APPLICABILITY
1	Read Body Diagnostic Trouble Codes. Is there a Park Lamp Relay Circuit Shorted Lo/Open DTC? Yes → Refer to symptom Park Lamp Relay Circuit Shorted Lo/Open in the Exterior Lighting. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Remove and inspect the Ash Receiver bulb. Is the bulb OK? Yes → Go To 3 No → Replace the Ash Receiver bulb. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn ignition off. Disconnect the Ash Receiver connector. Measure the resistance of the Ground circuit in the Ash Receiver connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open Ground circuit. Perform BODY VERIFICATION TEST - VER 1.	All
4	Turn ignition off. Disconnect the Ash Receiver connector. Disconnect the BCM C1 connector. Measure the resistance of the Panel Lamps Driver circuit between the Ash Receiver connector and the BCM C1 connector (cav. #8). Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the open Panel Lamps Driver circuit. Perform BODY VERIFICATION TEST - VER 1.	All
5	If there are no possible causes remaining, view repair. Repair Replace the BCM. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*COURTESY LAMPS INOPERATIVE (EXCEPT FRONT DOORS)

POSSIBLE CAUSES
BULBS
OPEN FUSED B(+)
COURTESY LAMP CONTROL CIRCUIT OPEN
BCM, COURTESY LAMP

TEST	ACTION	APPLICABILITY
1	Remove and check inoperative bulbs. Are the bulbs OK? Yes → Go To 2 No → Replace the bulbs. Perform BODY VERIFICATION TEST - VER 1.	All
2	Measure the voltage of the Fused B(+) circuit to the Lamp. Is the voltage above 10.0 volts? Yes → Go To 3 No → Repair the open Fused B(+) circuit back to splice. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn ignition off. Disconnect the BCM C1 connector. Gain access to an inoperative bulb. Measure the Courtesy Lamp Control circuit from the BCM C1 connector to the bulb connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open Courtesy Lamp Control circuit. Perform BODY VERIFICATION TEST - VER 1.	All
4	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module (BCM). Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*COURTESY LAMPS INOPERATIVE FROM DOME LAMP SWITCH ONLY

POSSIBLE CAUSES
DTC PRESENT
LEFT MULTI FUNCTION SWITCH DIMMER OPEN
BCM DIMMER INOPORATIVE

TEST	ACTION	APPLICABILITY
1	Turn ignition on. Using the DRBIII®, read body DTCs. Are there any DTCs present? Yes → Select the appropriate DTC from the symptom list and perform repair as needed. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn ignition off. Disconnect the Left Multi Function Switch Connector. Connect an ohmmeter between the Panel Lamps Dimmer Signal circuit and the Headlamp Switch Return circuit in the Left Multi-Funtion Switch. Observe the ohmmeter while rotating the dimmer on the Left Multi-Function Switch. Did the resistance vary between approximately 60 and 7900 (7.9K) ohms? Yes → Go To 3 No → Replace the Left Multi Function Switch. Perform BODY VERIFICATION TEST - VER 1.	All
3	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*COURTESY LAMPS INOPERATIVE FROM DRIVERS FRONT DOOR ONLY

POSSIBLE CAUSES
OPEN GROUND WIRE
OPEN DRIVER DOOR AJAR SWITCH SENSE
DRIVER DOOR AJAR SWITCH
DRIVER DOOR MODULE (AJAR SWITCH OPEN)
BODY CONTROL MODULE - DRIVER DOOR AJAR OPEN

TEST	ACTION	APPLICABILITY
1	Open the Drivers door. With the DRB III select: Body Door Modules Input Output Read the Drv Door Ajar Sw state. Does the DRB III Show: CLOSED? Yes → Go To 2 No → Go To 3	All
2	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All
3	Disconnect the Driver Door Lock Motor/Ajar switch connector Measure the resistance of the ground circuit. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open ground wire to the door ajar switch connector. Perform BODY VERIFICATION TEST - VER 1.	All
4	Disconnect the Driver Door Module C1 connector. Disconnect the Door Lock Motor/Ajar Switch connector. Measure the resistance of the Driver Door Ajar Switch Sense circuit between the door lock motor/ajar switch connector and the DDM C1 connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the open Driver Door Ajar Switch Sense wire. Perform BODY VERIFICATION TEST - VER 1.	All

*COURTESY LAMPS INOPERATIVE FROM DRIVERS FRONT DOOR ONLY — Continued

TEST	ACTION	APPLICABILITY
5	Remove the inner door trim panel. Disconnect the Driver Door Module C1 connector. Ensure the door is left open during this test. Measure the resistance of the Driver Door Ajar Switch Sense circuit in the DDM C1 connector to ground. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Replace the Driver Door Lock Motor/Ajar Switch Assy. Perform BODY VERIFICATION TEST - VER 1.	All
6	If there are no possible causes remaining, view repair. Repair Replace the Driver Door Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*COURTESY LAMPS INOPERATIVE FROM LEFT REAR DOOR ONLY

POSSIBLE CAUSES
OPEN DOOR AJAR SWITCH SENSE (LEFT REAR)
OPEN GROUND WIRE
LEFT REAR DOOR AJAR SWITCH
BODY CONTROL MODULE (AJAR SWITCH OPEN)

TEST	ACTION	APPLICABILITY
1	Open the Left Rear door. With the DRB III select: Body Computer Input/Output Read the Left Rear Door Ajar SW state. Does the DRBIII Show: ″CLOSED″? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Remove the inner door trim panel. Disconnect the Junction Block C1 connector. Disconnect the Left Rear Door Lock Motor/Ajar Switch connector. Measure the resistance of the Door Ajar Switch Sense LR circuit between the door lock motor/ajar switch connector and the Junction Block C1 connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open Door Ajar Switch Sense wire (Left Rear). Perform BODY VERIFICATION TEST - VER 1.	All
3	Disconnect the Driver Rear Door Lock Motor/Ajar switch connector Measure the resistance of the ground circuit. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open ground wire to the door ajar switch connector. Perform BODY VERIFICATION TEST - VER 1.	All
4	Remove the inner door trim panel. Disconnect the Junction Block ″C1″ connector. Ensure the door is left open during this test. Measure the resistance of the Door Ajar Switch Sense (LR) circuit in the Junction Block ″C1″ connector to ground. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Replace the Door Lock Motor/Ajar Switch Assy. Perform BODY VERIFICATION TEST - VER 1.	All

*COURTESY LAMPS INOPERATIVE FROM LEFT REAR DOOR ONLY — Continued

TEST	ACTION	APPLICABILITY
5	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*COURTESY LAMPS INOPERATIVE FROM LIFTGATE

POSSIBLE CAUSES
BCM, LAMPS DISABLED
CARGO LAMP
COURTESY LAMP DISABLE
OPEN GROUND WIRE
OPEN LIFTGATE AJAR SWITCH SENSE
OPEN LIFTGATE AJAR SWITCH
BODY CONTROL MODULE (LIFTGATE AJAR SWITCH OPEN)

TEST	ACTION	APPLICABILITY
1	With the DRBIII® in Inputs Outputs read the Lift Gate Lmp Disable state while depressing the cargo lamp lens switch on and off. Did the disable switch toggle? Yes → Go To 2 No → Go To 7	All
2	With the DRB III select: Body Computer Input/Output Read the Liftgate Sw state with the Liftgate open. Does the DRBIII Show: CLOSED? Yes → If there are no possible causes remaining, replace the BCM. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Disconnect either the right or left side Liftgate Ajar Switch connector. Measure the resistance of the ground circuit. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open ground wire to the ajar switch connector. Perform BODY VERIFICATION TEST - VER 1.	All
4	Disconnect the Junction Block C1 connector. Disconnect either the right or left side Liftgate Ajar Switch. Measure the resistance of the Liftgate Flip-up Ajar Switch Sense circuit between the disconnected Flip-up Ajar Switch connector and the Junction Block C1 connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the open Liftgate Ajar Switch Sense wire. Perform BODY VERIFICATION TEST - VER 1.	All

*COURTESY LAMPS INOPERATIVE FROM LIFTGATE — Continued

TEST	ACTION	APPLICABILITY
5	Disconnect the suspect faulty right or left Liftgate ajar switch connector. Ensure the latch is in the unlatched position for the particular switch. Using an ohmmeter measure the resistance of the Ajar Switch. Is the resistance below 2.0 ohms? Yes → Go To 6 No → Replace the Liftgate Ajar Switch Assy. Perform BODY VERIFICATION TEST - VER 1.	All
6	If there are no possible causes remaining, view repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All
7	At the Cargo Lamp connector backprobe and measure the voltage of the liftgate courtesy lamp disable circuit with switch in both positions. Is the voltage below 0.5 volt in either position? Yes → If there are no possible causes remaining, replace the BCM. Perform BODY VERIFICATION TEST - VER 1. No → Go To 8	All
8	Disconnect the cargo lamp connector. Measure the voltage of the liftgate courtesy lamp disable circuit. Is the voltage above 2.0 volts? Yes → Repair the courtesy lamp disable circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Cargo Lamp assemble. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*COURTESY LAMPS INOPERATIVE FROM LIFTGATE FLIP-UP GLASS ONLY

POSSIBLE CAUSES
OPEN GROUND WIRE
OPEN LIFTGATE AJAR SWITCH SENSE
BCM FLIP-UP AJAR SWITCH OPEN
OPEN LIFTGATE FLIP-UP AJAR SWITCH

TEST	ACTION	APPLICABILITY
1	With the DRB III select: Body Computer Input/Output Read the Liftglass Sw state with the Liftgate flip-up glass open. Does the DRBIII Show: CLOSED? Yes → Go To 2 No → Go To 3	All
2	If there are no potential causes remaining, replace the Body Control Module. View repair options. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All
3	Disconnect the Liftgate Flip-up Ajar Switch connector Measure the resistance of the ground circuit. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open ground wire to the ajar switch connector. Perform BODY VERIFICATION TEST - VER 1.	All
4	Disconnect the Junction Block C1 connector. Disconnect a Liftgate Flip-up Ajar Switch. Measure the resistance of the Liftgate Flip-up Ajar Switch Sense circuit between the disconnected Flip-up Ajar Switch connector and the Junction Block C1 connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the open Liftgate Ajar Switch Sense wire. Perform BODY VERIFICATION TEST - VER 1.	All
5	If there are no possible causes remaining, view repair. Repair Replace the Liftgate Flip-Up Ajar Switch Assy. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:

***COURTESY LAMPS INOPERATIVE FROM PASSENGER FRONT DOOR ONLY**

POSSIBLE CAUSES
OPEN GROUND WIRE
OPEN PASSENGER DOOR AJAR SWITCH SENSE WIRE
PASSENGER DOOR AJAR SWITCH
BCM COURTESY LAMPS INOPERATIVE FROM PASSENGER FRONT DOOR ONLY
PASSENGER DOOR MODULE (AJAR SWITCH OPEN)

TEST	ACTION	APPLICABILITY
1	Open the passenger door. With the DRB III select: Body Door Modules Input/Output Read the Pass Door Ajar Sw state. Does the DRBIII Show: CLOSED? Yes → Replace the BCM. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Passenger Door Lock Motor/Ajar switch connector Measure the resistance of the ground circuit. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open ground wire to the door ajar switch connector. Perform BODY VERIFICATION TEST - VER 1.	All
3	Disconnect the Passenger Door Module C1 connector. Disconnect the Door Lock Motor/Ajar Switch connector. Measure the resistance of the Passenger Door Ajar Switch Sense circuit between the door lock motor/ajar switch connector and the PDM C1 connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open Passenger Door Ajar Switch Sense wire. Perform BODY VERIFICATION TEST - VER 1.	All
4	Disconnect the Passenger Door Module ″C1″ connector. Ensure the door is left open during this test. Measure the resistance of the Passenger Door Ajar Switch Sense circuit in the PDM C1 connector to ground. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Replace the Passenger Door Lock Motor/Ajar Switch Assy. Perform BODY VERIFICATION TEST - VER 1.	All

*COURTESY LAMPS INOPERATIVE FROM PASSENGER FRONT DOOR ONLY — Continued

TEST	ACTION	APPLICABILITY
5	If there are no possible causes remaining, view repair. Repair Replace the Passenger Door Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*COURTESY LAMPS INOPERATIVE FROM RIGHT REAR DOOR ONLY

POSSIBLE CAUSES
OPEN GROUND WIRE
OPEN DOOR AJAR SWITCH SENSE (RR)
BODY CONTROL MODULE (AJAR SWITCH OPEN)
RIGHT REAR DOOR AJAR SWITCH
BCM RIGHT REAR DOOR FAILURE

TEST	ACTION	APPLICABILITY
1	Open the Right Rear door. With the DRB III select: Body Body Controlller Input/Output Read the Right Rear Door Ajar Sw state. Does the DRBIII Show: CLOSED? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Passenger Rear Door Lock Motor/Ajar switch connector Measure the resistance of the ground circuit. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open ground wire to the door ajar switch connector. Perform BODY VERIFICATION TEST - VER 1.	All
3	Disconnect the Body Control Module C1 connector. Disconnect the Passenger Rear Door Lock Motor/Ajar Switch connector. Measure the resistance of the Door Ajar Switch Sense (Right Rear) circuit between the door lock motor/ajar switch connector and the Body Control Module C1 connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open Door Ajar Switch Sense wire (RR). Perform BODY VERIFICATION TEST - VER 1.	All
4	Disconnect the Body Control Module C1 connector. Ensure that the door is open during this test. Measure the resistance of the Door Ajar Switch Sense (Right Rear) circuit in the Body Control Module C1 connector to ground. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Replace the Door Lock Motor/Ajar Switch Assy. Perform BODY VERIFICATION TEST - VER 1.	All

*COURTESY LAMPS INOPERATIVE FROM RIGHT REAR DOOR ONLY — Continued

TEST	ACTION	APPLICABILITY
5	If there are no possible causes remaining, view "Repair". Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*COURTESY LAMPS ON AT ALL TIMES (EXCEPT BOTH FRONT DOOR COURTESY LAMPS IF EQUIP)

POSSIBLE CAUSES
JUNCTION BLOCK
BCM, COURTESY LAMPS STAY ON
COURTESY LAMP DRIVER CIRCUIT SHORTED TO GROUND

TEST	ACTION	APPLICABILITY
1	Turn ignition off. Ensure the courtesy lamp switch is in the off position. Remove the Body Control Module from the Junction Block. Did the courtesy lamps turn off? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn ignition off. Ensure the courtesy lamp switch is in the off position. Disconnect the Junction Block C-1 connector. Measure the Courtesy Lamp Driver circuit from the Junction Block C1 connector cavity 16 to ground. Is the resistance below 5.0 ohms? Yes → Repair the Courtesy Lamp Driver circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Junction Block Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*DRIVER DOOR COURTESY LAMP INOPERATIVE

POSSIBLE CAUSES
BULB
OPEN COURTESY LAMP DRIVER CIRCUIT
OPEN COURTESY LAMP GROUND CIRCUIT
DRIVER DOOR MODULE COURTESY LAMP

TEST	ACTION	APPLICABILITY
1	Remove and inspect the courtesy lamp bulb. Is the Courtesy Lamp bulb open? Yes → Replace the bulb. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Remove the Driver's Door Courtesy Lamp Bulb. Disconnect the Driver Door Module C-2 connector Measure the Courtesy Lamp Driver circuit from the bulb connector to the Driver Door Module C-2 connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open Courtesy Lamp Driver circuit. Perform BODY VERIFICATION TEST - VER 1.	All
3	Remove the Driver's Door Courtesy Lamp Bulb. Disconnect the Driver Door Module C-2 connector Measure the Courtesy Lamp Ground circuit from the bulb connector to the Driver Door Module C-2 connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open Courtesy Lamp Ground circuit. Perform BODY VERIFICATION TEST - VER 1.	All
4	View repair options. Repair Replace the Driver Door Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*GLOVE BOX LAMP INOPERATIVE

POSSIBLE CAUSES
GLOVE BOX BULB
OPEN FUSED B+ CIRCUIT
GLOVE BOX SWITCH
OPEN GLOVE BOX LAMP DRIVER CIRCUIT
BCM

TEST	ACTION	APPLICABILITY
1	Remove and inspect the Glove Box Bulb. Is the bulb OK? Yes → Go To 2 No → Replace the Glove Box Bulb. Perform BODY VERIFICATION TEST - VER 1.	All
2	Disconnect the glove box lamp harness connector. Measure the voltage of the Fused B+ circuit. Is the voltage above 10.5 volts? Yes → Go To 3 No → Repair the open Fused B+ circuit. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn ignition off. Disconnect the glove box lamp harness connector. Disconnect the BCM C1 connector. Measure the resistance of the Glove Box Lamp Driver circuit between the Glove Box Lamp harness connector (cav. 2) and the BCM C1 connector (cav. 23). Is the resistance above 5.0 ohms? Yes → Go To 4 No → Repair the open Glove Box Lamp Driver circuit. Perform BODY VERIFICATION TEST - VER 1.	All
4	Disconnect the glove box lamp harness connector. Connect a test light between cavities 1 and 2 of the Glove Box Lamp harness. Did the test light illuminate? Yes → Replace the Glove Box Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	View repair options Repair Replace the BCM (Body Control Module). Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*HEATED SEAT SWITCH ILLUMINATION LAMP INOPERATIVE

POSSIBLE CAUSES
DRIVERS HEATED SEAT SWITCH BULB OPEN
PASSENGER HEATED SEAT SWITCH BULB OPEN
OPEN GROUND CIRCUIT (DRIVERS SIDE)
OPEN GROUND CIRCUIT (PASSENGER SIDE)
PANEL LAMPS DRIVER CIRCUIT OPEN (PASSENGER SIDE)
PANEL LAMPS DRIVER CIRCUIT OPEN (DRIVERS SIDE)
BCM

TEST	ACTION	APPLICABILITY
1	Remove and inspect the Drivers Heated Seat Switch bulb. Is the bulb OK? Yes → Go To 2 No → Replace the Drivers Heated Seat Switch bulb. Perform BODY VERIFICATION TEST - VER 1.	All
2	Remove and inspect the Passenger Heated Seat Switch bulb. Is the bulb OK? Yes → Go To 3 No → Replace the Passenger Heated Seat Switch bulb. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn ignition off. Disconnect the Drivers Heated Seat Switch connector. Measure the resistance of the Ground circuit in the Drivers Heated Seat Switch connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open Ground circuit. Perform BODY VERIFICATION TEST - VER 1.	All
4	Turn ignition off. Disconnect the Passenger Heated Seat Switch connector. Measure the resistance of the Ground circuit in the Passenger Heated Seat Switch connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the open Ground circuit. Perform BODY VERIFICATION TEST - VER 1.	All

*HEATED SEAT SWITCH ILLUMINATION LAMP INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
5	Turn ignition off. Disconnect the Passenger Heated Seat Switch connector. Disconnect the BCM C1 connector. Measure the resistance of the Panel Lamps Driver circuit between the Passenger Heated Seat Switch connector and the BCM C1 connector (cav. #12). Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the open Panel Lamps Driver circuit. Perform BODY VERIFICATION TEST - VER 1.	All
6	Turn ignition off. Disconnect the Drivers Heated Seat Switch connector. Disconnect the BCM C1 connector. Measure the resistance of the Panel Lamps Driver circuit between the Drivers Heated Seat Switch connector and the BCM C1 connector. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the open Panel Lamps Driver circuit. Perform BODY VERIFICATION TEST - VER 1.	All
7	View repair options. Repair Replace the BCM. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*HVAC CONTROL ILLUMINATION LAMPS INOPERATIVE

POSSIBLE CAUSES
HVAC CONTROL ILLUMINATION INOPERATIVE
CONTROL HEAD OPEN GROUND CIRCUIT
PANEL LAMPS DRIVER CIRCUIT OPEN
BCM (HVAC ILUMINATION)

TEST	ACTION	APPLICABILITY
1	Disconnect the appropriate HVAC Control panel connector. C-1 for manual or C-2 for automatic system. Connect a test light between the HVAC ground circuit and Panel Lamps Driver circuit in the HVAC connector(s). Turn on the panel lamps and observe the test light. Did the test light illuminate? Yes → Replace the Heater-A/C Control Panel Assembly. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn ignition off. Disconnect the HVAC connectors. Measure the resistance of the Ground circuit in the HVAC C1 or C2 (see connector pinout to determine which connector). Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open HVAC Ground Circuit. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn ignition off. Disconnect the HVAC connectors. Disconnect the BCM C1 connector. Measure the resistance of the Panel Lamps Driver circuit between the HVAC C1 or C2 connector (refer to connector pinout to determine which connector) and the BCM C1 connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open in the Panel Lamps Driver circuit. Perform BODY VERIFICATION TEST - VER 1.	All
4	View repair options. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*I/P COURTESY LAMPS INOP

POSSIBLE CAUSES
BCM I/P COURTESY LAMPS INOP
BULBS OPEN
OPEN FUSED B(+)
COURTESY LAMP CONTROL CIRCUIT OPEN

TEST	ACTION	APPLICABILITY
1	Remove and check inoperative bulbs. Are the bulbs OK? Yes → Go To 2 No → Replace the bulbs. Perform BODY VERIFICATION TEST - VER 1.	All
2	Measure the voltage of the Fused B(+) circuit to the Lamp. Is the voltage above 10.0 volts? Yes → Go To 3 No → Repair the open Fused B(+) circuit back to splice. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn ignition off. Disconnect the BCM C1 connector. Gain access to an inoperative bulb. Measure the Courtesy Lamp Control circuit from the BCM C1 connector to the bulb connector. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Repair the open Courtesy Lamp Control circuit. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*LIFTGATE COURTESY LAMP DISABLE FEATURE INOPERATIVE

POSSIBLE CAUSES
OPEN FUSED B(+)
OPEN LIFTGATE COURTESY DISABLE CIRCUIT
LIFTGATE COURTESY DISABLE SWITCH
BCM COURTESY DISABLE

TEST	ACTION	APPLICABILITY
1	Disconnect the Cargo Lamp connector. Measure the voltage of the Fused B(+) circuit at the Cargo Lamp connector. Is the voltage above 10.0 volts? Yes → Go To 2 No → Repair the open Fused B(+) circuit to the Cargo Lamp connector. Perform BODY VERIFICATION TEST - VER 1.	All
2	Disconnect the Cargo Lamp connector. Disconnect the Junction Block C1 connector. Measure the resistance of the Liftgate Courtesy Disable circuit between the Cargo Lamp connector and the Junction Block C1 connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open ″Liftgate Courtesy Disable″ wire. Perform BODY VERIFICATION TEST - VER 1.	All
3	Gain access to the Cargo Lamp connector but do not disconnect. Using a voltmeter backprobe the Liftgate Courtesy Disable circuit at the Cargo Lamp connector while cycling the Disable Switch on and off. Does the voltage toggle from approximatly 10.0 to 0.0 volts? Yes → Go To 4 No → Replace the Liftgate (Cargo) Lamp assemble. Perform BODY VERIFICATION TEST - VER 1.	All
4	View repair options. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*OVERHEAD, REAR AND LIFTGATE LAMPS INOPERATIVE

POSSIBLE CAUSES
BULBS
OPEN FUSED B(+)
COURTESY LAMP DRIVER CIRCUIT OPEN
BCM COURTESY LAMP DRIVER

TEST	ACTION	APPLICABILITY
1	Remove and check inoperative bulbs. Are the bulbs OK? Yes → Go To 2 No → Replace the bulbs. Perform BODY VERIFICATION TEST - VER 1.	All
2	Measure the voltage of the Fused B(+) circuit to the Lamp. Is the voltage above 10.0 volts? Yes → Go To 3 No → Repair the open Fused B(+) circuit back to splice. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn ignition off. Disconnect the Junction Block C1 connector. Gain access to an inoperative bulb. Measure the Courtesy Lamp Driver circuit from the Junction Block C1 connector cavity 16 to the bulb connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open Courtesy Lamp Driver circuit. Perform BODY VERIFICATION TEST - VER 1.	All
4	Turn the Dome Lamp Switch to the ON position. Disconnect Fuse # 8 from the Junction Block. While backprobing, measure the resistance of the Courtesy Lamp Driver circuit at the Body Control Module C-1 connector cavity # 8. Is the resistance below 5.0 ohms? Yes → Test Complete. No → Replace the Body Control Module (BCM). Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*PASSENGER DOOR COURTESY LAMP INOPERATIVE

POSSIBLE CAUSES
BULB
OPEN COURTESY LAMP DRIVER CIRCUIT
OPEN COURTESY LAMP GROUND CIRCUIT
PASSENGER DOOR MODULE COURTESY LAMP

TEST	ACTION	APPLICABILITY
1	Remove and inspect the courtesy lamp bulb. Is the Courtesy Lamp bulb open? Yes → Replace the bulb. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Remove the Passenger Door Courtesy Lamp Bulb. Disconnect the Passenger Door Module C-2 connector Measure the Courtesy Lamp Driver circuit from the bulb connector to the Passenger Door Module C-2 connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open Courtesy Lamp Driver circuit. Perform BODY VERIFICATION TEST - VER 1.	All
3	Remove the Passenger's Door Courtesy Lamp Bulb. Disconnect the Passenger Door Module C-2 connector Measure the Courtesy Lamp Ground circuit from the bulb connector to the Passenger Door Module C-2 connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open Courtesy Lamp Ground circuit. Perform BODY VERIFICATION TEST - VER 1.	All
4	View repair options. Repair Replace the Passenger Door Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*PRNDL/T-CASE ILLUMINATION LAMPS INOPERATIVE

POSSIBLE CAUSES
PRNDL OPEN GROUND CONNECTION
PANEL LAMPS DRIVER CKT OPEN
PRNDL ILLUMINATION
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Disconnect the PRNDL/Transfer Case Illumination connector. Connect a test light between the ground circuit and the Panel Lamps Driver circuit in the PRNDL/Transfer Case Illumination connector. Turn on the panel lamps and observe the test light. Did the test light illuminate? Yes → Replace the PRNDL/Transfer Case Illumination assembly. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn ignition off. Disconnect the PRNDL/Transfer Case Illumination connector. Measure the resistance of the Ground circuit in the PRNDL connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open Ground circuit. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn ignition off. Disconnect the PRNDL/Transfer Case Illumination connector. Disconnect the BCM C1 connector. Measure the resistance of the Panel Lamps Driver circuit between the PRNDL connector and the BCM C1 connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open in the Panel Lamps Driver Circuit. Perform BODY VERIFICATION TEST - VER 1.	All
4	View repair options. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*RADIO ILLUMINATION LAMPS INOPERATIVE

POSSIBLE CAUSES
RADIO GROUND CIRCUIT OPEN
BCM (RADIO ILLUMINATION)
PANEL LAMPS DRIVER CKT OPEN
RADIO ILLUMINATION

TEST	ACTION	APPLICABILITY
1	Disconnect the Radio C1 connector. Connect a test light between the Radio ground connection and Panel Lamps Driver circuit in the Radio C1 connector. Turn on the panel lamps and observe the test light. Did the test light illuminate? Yes → Repair or replace the Radio. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the Radio ground wire. Measure the resistance between ground and the radio ground wire. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Replace or repair the radio ground strap. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn ignition off. Disconnect the Radio C1 connector. Disconnect the BCM C1 connector. Measure the resistance of the Panel Lamps Driver circuit between the Radio C1 connector and the BCM C1 connector (cav. #13). Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open in the Panel Lamps Driver Circuit. Perform BODY VERIFICATION TEST - VER 1.	All
4	View repair options. Repair Replace the BCM. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*READING & VANITY LAMPS INOPERATIVE

POSSIBLE CAUSES
BULBS
COURTESY LAMP DRIVER CIRCUIT OPEN
BCM, COURTESY LAMP DRIVER

TEST	ACTION	APPLICABILITY
1	Remove and check inoperative bulbs. Are the bulbs OK? Yes → Go To 2 No → Replace the bulbs. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn ignition off. Disconnect the Junction Block C1 connector. Gain access to an inoperative bulb. Measure the Courtesy Lamp Driver circuit from the Junction Block C1 connector to the bulb connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open Courtesy Lamp Driver circuit or Switch. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the Dome Lamp Switch to the ON position. Disconnect Fuse # 8 from the Junction Block. While backprobing, measure the resistance of the Courtesy Lamp Driver circuit at the Body Control Module C-1 connector cavity # 8. Is the resistance below 5.0 ohms? Yes → Test Complete. No → Replace the defective Body Control Module (BCM). Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
FRONT RISER SENSOR OUT OF RANGE HIGH

When Monitored and Set Condition:

FRONT RISER SENSOR OUT OF RANGE HIGH

When Monitored: Igntion on.

Set Condition: This condition is immediately set when the seat motor potentiometer feeds a value higher than the Memory Seat Module has stored in EEPROM.

POSSIBLE CAUSES
SEAT SENSOR GROUND WIRE OPEN
FRONT RISER SENSOR SIGNAL SHORT TO MOTOR
SEAT SENSOR 5 VOLT SUPPLY SHORT TO BATTERY
FRONT RISER POSITION SIGNAL CKT SHORT TO VOLTAGE
FRONT RISER SENSOR HIGH
MEMORY SEAT MODULE INTERNAL GROUND OPEN
MEMORY SEAT MODULE FRONT RISER HIGH

TEST	ACTION	APPLICABILITY
1	Turn ignition off. Disconnect the Driver Power Seat Front Riser Sensor connector. Measure the resistance of the Seat Position Sensor Ground circuit at the driver power seat front riser connector. Is the resistance below 5.0 ohms? Yes → Go To 2 No → Go To 7	All
2	Ensure all seat and sensor connectors are connected and front riser motor is operational. With the DRB III select: Body Memory Seat Sensors Monitor the Front Riser Position sensor while operating the seat front riser to both limits. Did the voltage ever go above 8.0 volts ONLY when the motor was in operation? Yes → Replace the Seat Track Assembly. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 3	All

FRONT RISER SENSOR OUT OF RANGE HIGH — Continued

TEST	ACTION	APPLICABILITY
3	Disconnect the Driver Power Seat Front Riser Sensor connector. Disconnect the Seat Module C1 connector. Turn ignition on. Measure the voltage between the Front Riser Position Signal circuit and ground. Is the voltage above 0.2 volts? No → Go To 4 Yes → Repair the Front Riser Position Signal circuit for a short to voltage. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
4	Disconnect the Seat Front Riser Position Sensor connector. Measure the voltage between the Seat Sensor 5 volt supply circuit and ground. Is the voltage above 5.5 volts? Yes → Repair the seat sensor 5 volt supply ckt for a short to battery. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 5	All
5	Turn ignition off. Disconnect the Driver Power Seat Front Riser Sensor connector. Ensure the Memory Seat Module is fully connected before proceeding. Turn ignition on. With the DRB III® in Memory Seat Sensors. Read the Front Riser Position Sensor voltage Is the voltage above 0.2 volts? Yes → Go To 6 No → Replace the Seat Track Assy. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
6	If there are no possible causes remaining, view repair. Repair Replace the Memory Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
7	Turn ignition off. Disconnect the Seat Module C1 connector. Disconnect the Driver Power Seat Front Riser Sensor connector. Measure the resistance of the Seat Position Sensor Ground wire between the Seat Module connector and the sensor connector. Is the resistance below 5.0 ohms? Yes → Go To 8 No → Repair the open Seat Sensor Ground Wire. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
8	If there are no possible causes remaining, view repair. Repair Replace the Memory Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:
FRONT RISER SENSOR OUT OF RANGE LOW

When Monitored and Set Condition:

FRONT RISER SENSOR OUT OF RANGE LOW

When Monitored: Ignition on.

Set Condition: This condition is immediately set when the seat motor potentiometer feeds a value lower than the Memory Seat Module has stored in EEPROM.

POSSIBLE CAUSES
SEAT SENSOR 5 VOLT SUPPLY SHORT TO GROUND
FRONT RISER SENSOR (LOW)
SEAT SENSOR 5 VOLT SUPPLY OPEN
FRONT RISER POSITION SIGNAL CIRCUIT SHORT TO GROUND
FRONT RISER POSITION SIGNAL CIRCUIT OPEN
MEMORY SEAT MODULE INTERNAL 5 VOLT LOW
MEMORY SEAT MODULE INTERNAL SENSE LOW

TEST	ACTION	APPLICABILITY
1	Ensure the Memory Seat Module is fully connected before proceeding. Disconnect the Driver Power Seat Front Riser Sensor connector. Turn ignition on. Measure the voltage of the Seat Sensor 5 Volt Supply circuit. Is the voltage above 4.5 volts? Yes → Go To 2 No → Go To 6	All
2	Turn ignition off. Disconnect the Driver Power Seat Front Riser Sensor connector. Connect a jumper wire between Seat Sensor 5 Volt Supply and Front Riser Position Signal circuits. Ensure the Memory Seat Module is fully connected before proceeding. With the DRBIII® select: Body, Memory Seat and Sensors. Turn ignition on. Read the Front Riser Position Sensor voltage Is the voltage above 4.5 volts? Yes → Replace the Seat Track Assy. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 3	All

FRONT RISER SENSOR OUT OF RANGE LOW — Continued

TEST	ACTION	APPLICABILITY
3	Turn ignition off. Disconnect the Seat Module C1 connector. Disconnect the Driver Power Seat Front Riser Sensor connector. Measure the resistance of the Front Riser Position Signal circuit to ground. Is the resistance below 1000 (1 K) ohms? Yes → Repair the Front Riser Position Signal Circuit for a short to ground. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 4	All
4	Turn ignition off. Disconnect the Driver Power Seat Front Riser Sensor connector. Disconnect the Seat Module C1 connector. Measure the resistance of the Front Riser Position Signal circuit between the Sensor connector and the Seat Module C1 connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the open Front Riser Position Signal circuit. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
5	If there are no possible causes remaining, view repair. Repair Replace the Memory Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
6	Turn ignition off. Disconnect the Seat Module C1 connector. Measure the resistance of the Seat Sensor 5 Volt Supply circuit to body ground. Is the resistance below 1000 (1 K) ohms? Yes → Repair the Seat Sensor 5 Volt Supply for a short to ground. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 7	All
7	Turn ignition off. Disconnect the Seat Module C1 connector. Disconnect the Driver Power Seat Front Riser Sensor connector. Measure the resistance of the Seat Sensor 5 Volt Supply circuit between the Front Riser Sensor connector and the Seat Module C1 connector. Is the resistance below 5.0 ohms? Yes → Go To 8 No → Repair the open Seat Sensor 5 Volt Supply circuit. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
8	If there are no possible causes remaining, view repair. Repair Replace the Memory Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:
HORIZONTAL SENSOR OUT OF RANGE HIGH

When Monitored and Set Condition:

HORIZONTAL SENSOR OUT OF RANGE HIGH

When Monitored: Ignition on.

Set Condition: This condition is immediately set when the seat motor potentiometer feeds a value higher than the Memory Heated Seat/Mirror Module has stored in EEPROM.

POSSIBLE CAUSES
SEAT SENSOR GROUND WIRE OPEN
SEAT HORIZONTAL POSITION SIGNAL SHORT TO MOTOR
SEAT SENSOR 5 VOLT SUPPLY SHORT TO BATTERY
CHECKING SEAT HORIZONTAL POSITION SIGNAL SHORT TO VOLTAGE
HORIZONTAL POSITION SENSOR HIGH
MEMORY SEAT MODULE INTERNAL GROUND OPEN
MEMORY SEAT MODULE INTERNAL HIGH

TEST	ACTION	APPLICABILITY
1	Turn ignition off. Disconnect the Driver Power Seat Horizontal Position Sensor connector Measure the resistance of the Seat Position Sensor Ground circuit to body ground.. Is the resistance below 5.0 ohms? Yes → Go To 2 No → Go To 7	All
2	Ensure all seat and sensor connectors are connected and front Horizontal motor is operational. With the DRB III select: Body, Memory Seat, and Sensors. Monitor the Horizontal Position sensor while operating the seat horizontally to both limits. Did the voltage ever go above 7.0 volts ONLY when the motor was in operation? Yes → Replace the Seat Track Assembly. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 3	All
3	Disconnect the Driver Power Seat Horizontal Position Sensor connector Turn ignition on. Measure the voltage between the Seat Sensor 5 volt supply circuit and ground. Is the voltage above 5.5 volts? Yes → Repair the seat sensor 5 volt supply ckt for a short to battery. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 4	All

HORIZONTAL SENSOR OUT OF RANGE HIGH — Continued

TEST	ACTION	APPLICABILITY
4	Disconnect the Seat Module C1 connector. Disconnect the Driver Power Seat Horizontal Position Sensor connector Turn ignition on. Measure the voltage between Seat Horizontal Position Signal circuit and ground. Is there any voltage on the Seat Horizontal Position Signal circuit? No → Go To 5 Yes → Repair the Horizontal Position Signal ckt for a short to voltage. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
5	Turn ignition off. Disconnect the Driver Power Seat Horizontal Position Sensor connector Ensure the Memory Seat Module is fully connected before proceeding. Turn ignition on. With the DRBIII® select: Body, Memory Seat and Sensors. Read the Horizontal Position Sensor voltage Is the voltage above 0.2 volts? Yes → Go To 6 No → Replace the Seat Track Assy. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
6	If there are no possible causes remaining, view repair. Repair Replace the Memory Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
7	Turn ignition off. Disconnect the Driver Power Seat Horizontal Position Sensor connector Disconnect the Seat Module C1 connector. Measure the resistance of the Seat Position Sensor Ground wire between the Seat Module connector and the sensor connector. Is the resistance below 5.0 ohms? Yes → Go To 8 No → Repair the open Seat Sensor Ground Wire. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
8	If there are no possible causes remaining, view repair. Repair Replace the Memory Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:
HORIZONTAL SENSOR OUT OF RANGE LOW

When Monitored and Set Condition:

HORIZONTAL SENSOR OUT OF RANGE LOW

When Monitored: Ignition on.

Set Condition: This condition is immediately set when the seat motor potentiometer feeds a value lower than the Memory Heated Seat/Mirror Module has stored in EEPROM.

POSSIBLE CAUSES
SEAT SENSOR 5 V SUPPLY SHT GND
HORIZONTAL SENSOR (LOW)
SEAT SENSOR 5 VOLT SUPPLY OPEN
HORIZONTAL POS SIGNAL CKT SHORT TO GROUND
SEAT HORIZONTAL POSITION SIGNAL CKT OPEN
MEMORY SEAT MODULE INTERNAL 5 VOLT SUPPLY
MEMORY SEAT MODULE INTERNAL LOW

TEST	ACTION	APPLICABILITY
1	Ensure the Memory Seat Module is fully connected before proceeding. Disconnect the Driver Power Seat Horizontal Sensor connector. Turn ignition on. Measure the voltage of the Seat Sensor 5 Volt Supply circuit. Is the voltage above 4.5 volts? Yes → Go To 2 No → Go To 6	All
2	Turn ignition off. Disconnect the Driver Power Seat Horizontal Sensor connector. Connect a jumper wire between Seat Sensor 5 Volt Supply and Seat Horizontal Position Signal circuits. Ensure the Memory Seat Module is fully connected before proceeding. With the DRB III select: Body Memory Seat Sensors. Turn ignition on. Read the Horizontal Position Sensor voltage Is the voltage above 4.5 volts? Yes → Replace the Seat Track Assy. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 3	All

HORIZONTAL SENSOR OUT OF RANGE LOW — Continued

TEST	ACTION	APPLICABILITY
3	Turn ignition off. Disconnect the Seat Module C1 connector. Disconnect the Driver Power Seat Horizontal Sensor connector. Measure the resistance of the Seat Horizontal Position Signal circuit to ground. Is the resistance below 1000 (1 K) ohms? Yes → Repair the Seat Horizontal Position Signal Ckt for a short to ground. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 4	All
4	Turn ignition off. Disconnect the Seat Module C1 connector. Disconnect the Driver Power Seat Horizontal Sensor connector. Measure the resistance of the Seat Horizontal Position Signal circuit between the Sensor connector and the Seat Module connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the open Seat Horizontal Position Signal circuit. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
5	If there are no possible causes remaining, view repair. Repair Replace the Memory Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
6	Disconnect the Seat Module C1 connector. Turn ignition off. Measure the resistance of the Seat Sensor 5 Volt Supply circuit to ground. Is the resistance below 1000 (1 K) ohms? Yes → Repair the Seat Sensor 5 Volt Supply for a short to Ground. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 7	All
7	Disconnect the Driver Power Seat Horizontal Position Sensor connector Disconnect the Seat Module C1 connector. Turn ignition off. Measure the resistance of the Seat Sensor 5 Volt Supply circuit between the Sensor connector and the Module connector. Is the resistance below 5.0 ohms? Yes → Go To 8 No → Repair the open Seat Sensor 5 Volt Supply circuit. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
8	If there are no possible causes remaining, view repair. Repair Replace the Memory Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:
REAR RISER SENSOR OUT OF RANGE HIGH

When Monitored and Set Condition:

REAR RISER SENSOR OUT OF RANGE HIGH

When Monitored: Ignition on.

Set Condition: This condition is immediately set when the seat motor potentiometer feeds a value higher than the Memory Heated Seat/Mirror Module has stored in EEPROM.

POSSIBLE CAUSES
REAR RISER POSITION SIGNAL SHORT TO MOTOR
SEAT SENSOR GROUND WIRE OPEN
SEAT SENSOR 5 VOLT SUPPLY SHORT TO BATTERY
CHECKING REAR RISER POS SIG SHORT TO VOLTAGE
REAR RISER SENSOR (HIGH)
MEMORY SEAT MODULE - INTERNAL SHORT HIGH
MEMORY SEAT MODULE INTERNAL GROUND OPEN

TEST	ACTION	APPLICABILITY
1	Turn ignition off. Disconnect the Driver Power Seat Rear Riser Sensor connector. Measure the resistance of the Seat Position Sensor Ground circuit at the driver power seat rear riser connector. Is the resistance below 5.0 ohms? Yes → Go To 2 No → Go To 7	All
2	Ensure all seat and sensor connectors are connected and front riser motor is operational. With the DRB III select: Body Memory Seat Sensors Monitor the Rear Riser Position sensor while operating the seat rear riser to both limits. Did the voltage ever go above 7.0 volts only when the motor was in operation? Yes → Replace the Seat Track Assembly. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 3	All
3	Disconnect the Driver Power Seat Rear Riser Sensor connector. Turn ignition on. Measure the voltage between the Seat Sensor 5 volt supply circuit and ground. Is the voltage above 5.5 volts? Yes → Repair the seat sensor 5 volt supply ckt for a short to battery. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 4	All

REAR RISER SENSOR OUT OF RANGE HIGH — Continued

8	If there are no possible causes remaining, view repair. Repair Replace the Memory Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:
RECLINER SENSOR OUT OF RANGE HIGH

When Monitored and Set Condition:

RECLINER SENSOR OUT OF RANGE HIGH

When Monitored: Ignition on.

Set Condition: This condition is immediately set when the seat motor potentiometer feeds a value higher than the Memory Heated Seat/Mirror Module has stored in EEPROM.

POSSIBLE CAUSES
SEAT SENSOR GROUND WIRE OPEN
RECLINER POSITION SIGNAL SHORT TO MOTOR
SEAT SENSOR 5 VOLT SUPPLY SHORT TO BATTERY
RECLINER POSITION SIGNAL SHORT TO VOLTAGE
RECLINER POSITION SENSOR HIGH
MEMORY SEAT MODULE INTERNAL GROUND OPEN
MEMORY SEAT MODULE INTERNAL HIGH

TEST	ACTION	APPLICABILITY
1	Turn ignition off. Disconnect the Driver Power Seat Recliner Sensor connector. Measure the resistance of the Seat Position Sensor Ground circuit to body ground. Is the resistance below 5.0 ohms? Yes → Go To 2 No → Go To 7	All
2	Ensure all seat and sensor connectors are connected and recliner motor is operational. With the DRB III select: Body Memory Seat Sensors Monitor the Recliner Position sensor while operating the seat Recliner to both limits. Did the voltage ever go above 7.0 volts only when the motor was in operation? Yes → Replace the Seat Track Assembly. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 3	All
3	Disconnect the Driver Power Seat Recliner Sensor connector. Turn ignition on. Measure the voltage between the Seat Sensor 5 volt supply circuit and ground. Is the voltage above 5.5 volts? Yes → Repair the seat sensor 5 volt supply ckt for a short to battery. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 4	All

RECLINER SENSOR OUT OF RANGE HIGH — Continued

TEST	ACTION	APPLICABILITY
4	Disconnect the Seat Module C1 connector. Disconnect the Driver Power Seat Recliner Sensor connector. Turn ignition on. Measure the voltage between Recliner Position Signal circuit and ground. Is there any voltage on the Recliner Position Signal circuit? No → Go To 5 Yes → Repair the Recliner Position Signal ckt for a short to voltage. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
5	Turn ignition off. Disconnect the Driver Power Seat Recliner Position Sensor connector Ensure the Memory Seat Module is fully connected before proceeding. Turn ignition on. With the DRB III select: Body Memory Seat Sensors Read the Recliner Position Sensor voltage Is the voltage above 0.2 volts? Yes → Go To 6 No → Replace the Seat Track Assy. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
6	If there are no possible causes remaining, view repair. Repair Replace the Memory Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
7	Turn ignition off. Disconnect the Seat Module C1 connector. Disconnect the Driver Power Seat Recliner Sensor connector. Measure the resistance of the Seat Position Sensor Ground wire between the MSM connector and the sensor connector. Is the resistance below 5.0 ohms? Yes → Go To 8 No → Repair the open Seat Position Sensor Ground Wire. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
8	If there are no possible causes remaining, view repair. Repair Replace the Memory Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:
RECLINER SENSOR OUT OF RANGE LOW

When Monitored and Set Condition:

RECLINER SENSOR OUT OF RANGE LOW

When Monitored: Ignition on.

Set Condition: This condition is immediately set when the seat motor potentiometer feeds a value lower than the Memory Heated Seat/Mirror Module has stored in EEPROM.

POSSIBLE CAUSES
SEAT SENSOR 5 V SUPPLY SHORT TO GROUND
RECLINER POSITION SENSOR (LOW)
SEAT SENSOR 5 VOLT SUPPLY OPEN
RECLINER POSITION SIGNAL CKT SHORT TO GROUND
RECLINER POSITION SIGNAL CKT OPEN
MEMORY SEAT MODULE INTERNAL 5 VOLT LOW
MEMORY SEAT MODULE INTERNAL (LOW)

TEST	ACTION	APPLICABILITY
1	Ensure the Memory Seat Module is fully connected before proceeding. Disconnect the Driver Power Seat Recliner Sensor connector. Turn ignition on. Measure the voltage of the Seat Sensor 5 Volt Supply circuit. Is the voltage above 4.5 volts? Yes → Go To 2 No → Go To 6	All
2	Turn ignition off. Disconnect the Driver Power Seat Recliner Sensor connector. Connect a jumper wire between Seat Sensor 5 Volt Supply and Recliner Position Signal circuits. Ensure the Memory Seat Module is fully connected before proceeding. With the DRB III select: Body Memory Seat Sensors Turn ignition on. Read the Recliner Position Sensor voltage Is the voltage above 4.5 volts? Yes → Replace the Seat Track Assy. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 3	All

RECLINER SENSOR OUT OF RANGE LOW — Continued

TEST	ACTION	APPLICABILITY
3	Turn ignition off. Disconnect the Seat Module C1 connector. Disconnect the Driver Power Seat Recliner Sensor connector. Measure the resistance of the Recliner Position Signal circuit to ground. Is the resistance below 1000 (1 K) ohms? Yes → Repair the Recliner Position Signal Ckt for a short to ground. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 4	All
4	Turn ignition off. Disconnect the Seat Module C1 connector. Disconnect the Recliner Position Sensor connector. Measure the resistance of the Recliner Position Signal circuit between the Sensor connector and the Module connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the open Recliner Position Signal circuit. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
5	If there are no possible causes remaining, view repair. Repair Replace the Memory Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
6	Turn ignition off. Disconnect the Seat Module C1 connector. Measure the resistance of the Seat Sensor 5 Volt Supply circuit to ground. Is the resistance below 1000 (1 K) ohms? Yes → Repair the Seat Sensor 5 Volt Supply for a short to Ground. Perform VERIFICATION TEST -MEMORY SYSTEM. No → Go To 7	All
7	Disconnect the Recliner Position Sensor connector. Disconnect the Seat Module C1 connector. Turn ignition off. Measure the resistance of the Seat Sensor 5 Volt Supply circuit between the Sensor connector and the Module connector. Is the resistance below 5.0 ohms? Yes → Go To 8 No → Repair the open Seat Sensor 5 Volt Supply circuit. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
8	If there are no possible causes remaining, view repair. Repair Replace the Memory Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:
*DRIVER SEAT FRONT RISER MOVEMENT INOPERATIVE

POSSIBLE CAUSES
SEAT FRONT UP DRIVER WIRE OPEN
SEAT FRONT DOWN DRIVER WIRE OPEN
SEAT FRONT DOWN SWITCH SENSE WIRE OPEN
DRIVER FRONT RISER MOTOR INOPERATIVE
DRIVER POWER SEAT SWITCH
MSM FRONT RISER MOTOR OUTPUT
MSM FRONT RISER SWITCH INPUT OPEN
SEAT FRONT UP SWITCH SENSE WIRE OPEN

TEST	ACTION	APPLICABILITY
1	Using the DRB III select: Body Memory Seat Module Actuators Actuate the Front Riser Motor up and then down. Did the Front Riser Motor operate in both directions? Yes → Go To 2 No → Go To 6	All
2	Turn ignition off. Refer to service information to remove the seat and gain access to the connectors. Disconnect the Seat Module C1 connector. Disconnect the Driver Power Seat Switch connector. Measure the resistance of the Seat Front Down Switch Sense circuit between the MSM connector and the Seat Switch connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open Seat Front Down Switch Sense wire. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
3	Turn ignition off. Refer to service information to remove the seat and gain access to the connectors. Disconnect the Seat Module C1 connector. Disconnect the Driver Power Seat Switch connector. Measure the resistance of the Seat Front Up Switch Sense circuit between the MSM connector and the Seat Switch connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open Seat Front Up Switch Sense wire. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

*DRIVER SEAT FRONT RISER MOVEMENT INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
4	Ensure the Driver Power Seat Switch Is fully connected. Disconnect the Seat Module C1 connector. Connect a test light between the Seat Front Up Switch Sense circuit and the Seat Front Down Switch Sense circuit in the Seat Module connector. Move the Front Riser Switch to the UP and then the DOWN positions and observe the test light. Did the test light illuminate when the switch was moved in BOTH directions? Yes → Go To 5 No → Replace the Driver Power Seat Switch Perform VERIFICATION TEST -MEMORY SYSTEM.	All
5	If there are no possible causes remaining, view repair. Repair Replace the Memory Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
6	Refer to service information to remove the seat and gain access to the connectors. Disconnect the Seat Module C2 connector. Disconnect the driver power seat front riser motor connector. Measure the resistance of the Seat Front Up Driver circuit between the Seat Module connector and the seat front riser motor connector. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the Seat Front Up Driver wire for an open. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
7	Turn ignition off. Refer to service information to remove the seat and gain access to the connectors. Disconnect the Seat Module C2 connector. Disconnect the driver power seat front riser motor connector. Measure the resistance of the Seat Front Down Driver circuit between the MSM connector and the seat front riser motor connector. Is the resistance below 5.0 ohms? Yes → Go To 8 No → Repair the Seat Front Down Driver wire for an open. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
8	Refer to service information to remove the seat and gain access to the connectors. Disconnect the Seat Module C2 connector. Ensure the Front Riser Motor connector is connected at this time. Connect a jumper wire from the Seat Front Up Driver circuit to the Ground circuit in the Seat Module C2 connector. Connect a jumper wire to the Seat Front Down Driver circuit and momentarily touch it to the Fused B(+) circuit. Reverse the Ground and Fused B(+) jumper wires momentarily to run the motor in the opposite direction. Did the Front Riser Motor run in both directions? Yes → Go To 9 No → Replace the Seat Track Assy. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

*DRIVER SEAT FRONT RISER MOVEMENT INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
9	If there are no possible causes remaining, view repair. Repair Replace the Memory Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:
*DRIVER SEAT HORIZONTAL MOVEMENT INOPERATIVE

POSSIBLE CAUSES
SEAT HORIZONTAL FORWARD DRIVER WIRE OPEN
SEAT HORIZONTAL FORWARD SWITCH SENSE WIRE OPEN
SEAT HORIZONTAL REARWARD DRIVER WIRE OPEN
SEAT HORIZONTAL REARWARD SWITCH SENSE WIRE OPEN
DRIVER HORIZONTAL MOTOR INOPERATIVE
DRIVER POWER SEAT SWITCH
MSM HORIZONTAL MOTOR OUTPUT OPEN
MSM HORIZONTAL SWITCH INPUT OPEN

TEST	ACTION	APPLICABILITY
1	Using the DRB III select: Body Memory Seat Module Actuators Actuate the Horizontal Motor Forward and then Rearward. Did the Horizontal Motor operate in both directions? Yes → Go To 2 No → Go To 6	All
2	Turn ignition off. Refer to service information for seat removal to gain access to the connectors. Disconnect the Seat Module C1 connector. Disconnect the Driver Power Seat Switch connector. Measure the resistance of the Seat Horizontal Forward Switch Sense circuit between the Seat Module connector and the Seat Switch connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open Seat Horizontal Forward Switch Sense wire. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
3	Turn ignition off. Refer to service information for seat removal to gain access to the connectors. Disconnect the Seat Module C1 connector. Disconnect the Driver Power Seat Switch connector. Measure the resistance of the Seat Horizontal Rearward Switch Sense circuit between the Seat Module connector and the Seat Switch connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open Seat Horizontal Rearward Switch Sense wire. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

*DRIVER SEAT HORIZONTAL MOVEMENT INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
4	Ensure the Driver Power Seat Switch Is fully connected. Disconnect the Seat Module C1 connector. Connect a test light between the Seat Horizontal Forward Switch Sense circuit and the Seat Horizontal Rearward Switch Sense circuit in the Seat Module connector. Move the Seat Horizontal Switch to the Forward and then the Rearward positions and observe the test light. Did the test light illuminate when the switch was moved in both directions. Yes → Go To 5 No → Replace the Driver Power Seat Switch Perform VERIFICATION TEST -MEMORY SYSTEM.	All
5	If there are no possible causes remaining, view repair. Repair Replace the Memory Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
6	Refer to service information to remove the seat and gain access to the connectors. Disconnect the Seat Module C2 connector. Disconnect the driver power Seat Horizontal Motor connector. Measure the resistance of the Seat Horizontal Forward Driver circuit between the Seat Module connector and the seat horizontal motor connector. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the open Seat Horizontal Forward Driver wire. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
7	Turn ignition off. Refer to service information for seat removal to gain access to the connectors. Disconnect the Seat Module C2 connector. Disconnect the driver power seat horizontal motor connector. Measure the resistance of the Seat Horizontal Rearward Driver circuit between the Seat Module connector and the seat horizontal motor connector. Is the resistance below 5.0 ohms? Yes → Go To 8 No → Repair the open Seat Horizontal Rearward Driver wire. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
8	Refer to service information to remove the seat and gain access to the connectors. Disconnect the Seat Module C2 connector. Ensure the Seat Horizontal Motor connector is connected at this time. Connect a jumper wire from the Seat Horizontal Forward Driver circuit to the Ground circuit in the Seat Module C2 connector. Connect a jumper wire to the Seat Horizontal Rearward Driver circuit and momentarily touch it to the Fused B(+) circuit. Reverse the Ground and Fused B(+) jumper wires momentarily to run the motor in the opposite direction. Did the Seat Horizontal Motor run in both directions. Yes → Go To 9 No → Replace the Seat Track Assy. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

*DRIVER SEAT HORIZONTAL MOVEMENT INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
9	If there are no possible causes remaining, view repair. Repair Replace the Memory Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:
*DRIVER SEAT REAR RISER MOVEMENT INOPERATIVE

POSSIBLE CAUSES
SEAT REAR DOWN DRIVER WIRE OPEN
SEAT REAR DOWN SWITCH SENSE WIRE OPEN
SEAT REAR UP DRIVER WIRE OPEN
SEAT REAR UP SWITCH SENSE WIRE OPEN
DRIVER POWER SEAT SWITCH DEFECTIVE
DRIVER REAR RISER MOTOR INOPERATIVE
MSM REAR RISER MOTOR OUTPUT OPEN
MSM REAR RISER SWITCH INPUT OPEN

TEST	ACTION	APPLICABILITY
1	Using the DRB III select: Body Memory Seat Module Actuators Actuate the Rear Riser Motor Up and then Down. Did the Rear Riser Motor operate in both directions? Yes → Go To 2 No → Go To 6	All
2	Turn ignition off. Refer to service information for seat removal to gain access to the connectors. Disconnect the Seat Module C1 connector. Disconnect the Driver Power Seat Switch connector. Measure the resistance of the Seat Rear Down Switch Sense circuit between the Seat Module connector and the Seat Switch connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open Seat Rear Down Switch Sense wire. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
3	Turn ignition off. Raise the Driver Seat as high as possible to gain access to the connectors. Disconnect the Seat Module C1 connector. Disconnect the Driver Power Seat Switch connector. Measure the resistance of the Seat Rear Up Switch Sense circuit between the Seat Module connector and the Seat Switch connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open Seat Rear Up Switch Sense wire. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

*DRIVER SEAT REAR RISER MOVEMENT INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
4	Ensure the Driver Power Seat Switch Is fully connected. Disconnect the Seat Module C1 connector. Connect a test light between the Seat Rear Up Switch Sense circuit and the Seat Rear Down Switch Sense circuit in the seat module connector. Move the Seat Rear Riser Switch to the Up and then the Down positions and observe the test light. Did the test light illuminate when the switch was moved in BOTH directions. Yes → Go To 5 No → Replace the Driver Power Seat Switch Perform VERIFICATION TEST -MEMORY SYSTEM.	All
5	If there are no possible causes remaining, view repair. Repair Replace the Memory Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
6	Turn ignition off. Refer to service information for seat removal to gain access to the connectors. Disconnect the Seat Module C2 connector. Disconnect the driver power seat rear riser motor connector. Measure the resistance of the Seat Rear Down Driver circuit between the Seat Module connector and the seat front riser motor connector. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the open Seat Rear Down Driver wire. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
7	Refer to service information for seat removal to gain access to the connectors. Disconnect the Seat Module C2 connector. Disconnect the driver power seat rear riser motor connector. Measure the resistance of the Seat Rear Up Driver circuit between the Seat Module connector and the seat rear riser motor connector. Is the resistance below 5.0 ohms? Yes → Go To 8 No → Repair the open Seat Rear Up Driver wire. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
8	Refer to service information for seat removal to gain access to the connectors. Disconnect the Seat Module C2 connector. Ensure the Seat Horizontal Motor connector is connected at this time. Connect a jumper wire from the Seat Rear Up Driver circuit to the Ground circuit in the Seat Module C2 connector. Connect a jumper wire to the Seat Rear Down Driver circuit and momentarily touch it to the Fused B(+) circuit. Reverse the Ground and Fused B(+) jumper wires momentarily to run the motor in the opposite direction. Did the Seat Rear Riser Motor run in both directions. Yes → Go To 9 No → Replace the Seat Track Assy. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Move the Seat Recliner Switch to the Up and then the Down positions and observe the test light. Did the test light illuminate when the switch was moved in BOTH directions. Yes → Go To 5 No → Replace the Driver Power Seat Switch Perform VERIFICATION TEST -MEMORY SYSTEM.	All
5	If there are no possible causes remaining, view repair. Repair Replace the Memory Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
6	Turn ignition off. Refer to service information for seat removal to gain access to the connectors. Disconnect the Seat Module C2 connector. Disconnect the driver power Seat Recliner Motor connector. Measure the resistance of the Seat Recliner Down Driver circuit between the Seat Module connector and the seat recliner motor connector. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the open Seat Recliner Down Driver wire. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
7	Turn ignition off. Refer to service information for seat removal to gain access to the connectors. Disconnect the Seat Module C2 connector. Disconnect the driver power Seat Recliner Motor connector. Measure the resistance of the Seat Recliner Up Driver circuit between the Seat Module connector and the seat recliner motor connector. Is the resistance below 5.0 ohms? Yes → Go To 8 No → Repair the open Seat Recliner Up Driver wire. Perform VERIFICATION TEST -MEMORY SYSTEM.	All
8	Refer to service information for seat removal to gain access to the connectors. Disconnect the Seat Module C2 connector. Ensure the Seat Horizontal Motor connector is connected at this time. Connect a jumper wire from the Seat Recliner Up Driver circuit to the Ground circuit in the Seat Module C2 connector. Connect a jumper wire to the Seat Recliner Down Driver ckt and momentarily touch it to the Fused B(+) ckt. Reverse the Ground and Fused B(+) jumper wires momentarily to run the motor in the opposite direction. Did the Seat Recliner Motor run in both directions. Yes → Go To 9 No → Replace the Seat Track Assy. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

*DRIVER SEAT RECLINER MOVEMENT INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
9	If there are no possible causes remaining, view repair. Repair Replace the Memory Seat Module. Perform VERIFICATION TEST -MEMORY SYSTEM.	All

Symptom:
AMBIENT TEMPERATURE SENSOR CIRCUIT OPEN

When Monitored and Set Condition:

AMBIENT TEMPERATURE SENSOR CIRCUIT OPEN

When Monitored: With the ignition on.

Set Condition: The BCM detects the Ambient Temperature Sensor Signal circuit voltage is above 4.8 volts for 5 seconds or more. Customer complaint: EVIC temperature display is -40°C (-40°F).

POSSIBLE CAUSES
AMBIENT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE
AMBIENT TEMPERATURE SENSOR
AMBIENT TEMPERATURE SENSOR RETURN CIRCUIT OPEN
AMBIENT TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Disconnect the Ambient Temperature Sensor harness connector. Connect a jumper wire between the sensor signal and sensor ground circuits. Close all vehicle doors. Turn the ignition on. With the DRBIII® in Sensors, read the Outside Temperature voltage. Is the voltage below 0.5 volts? Yes → Replace the Ambient Temperature Sensor. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the Ambient Temperature Sensor harness connector. Disconnect the BCM C2 harness connector. Measure the voltage between the Ambient Temperature Sensor Signal circuit and ground. Is there any voltage present? Yes → Repair the Ambient Temperature Sensor Signal circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

AMBIENT TEMPERATURE SENSOR CIRCUIT OPEN — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Ambient Temperature Sensor harness connector. Disconnect the BCM C2 harness connector. Measure the resistance of the Ambient Temperature Sensor Return circuit between the BCM C2 harness connector and the Sensor harness connector. Is the resistance above 5.0 ohms? Yes → Repair the Ambient Temperature Sensor Return circuit for an open. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Disconnect the BCM C2 harness connector. Disconnect the Ambient Temperature Sensor harness connector. Measure the resistance of the Ambient Temperature Sensor Signal circuit between the BCM C2 harness connector and the Sensor harness connector. Is the resistance above 5.0 ohms? Yes → Repair the Ambient Temperature Sensor Signal circuit for an open. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
AMBIENT TEMPERATURE SENSOR CIRCUIT SHORT

When Monitored and Set Condition:

AMBIENT TEMPERATURE SENSOR CIRCUIT SHORT

When Monitored: With the ignition on.

Set Condition: The BCM detects that the Ambient Temperature Sensor signal circuit voltage is below 0.3 volts for 5 seconds or Customer complaint: EVIC temperature display is 55°C (130°).

POSSIBLE CAUSES
AMBIENT TEMPERATURE SENSOR
AMBIENT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO GROUND
AMBIENT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO SENSOR RETURN CIRCUIT
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the Ambient Temperature Sensor harness connector. Close all vehicle doors. Turn the ignition on. Observe the EVIC display. Does the EVIC display -40° F (-40°C)? Yes → Replace the Ambient Temperature Sensor. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the BCM C2 harness connector. Disconnect the Ambient Temperature Sensor harness connector. Measure the resistance between ground and the Ambient Temperature Sensor Signal circuit. Is the resistance below 5.0 ohms? Yes → Repair the Ambient Temperature Sensor Signal circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

AMBIENT TEMPERATURE SENSOR CIRCUIT SHORT — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Ambient Temperature Sensor harness connector. Disconnect the BCM C2 harness connector. Measure the resistance between the Ambient Temperature Sensor Signal circuit and Ambient Temperature Sensor Return circuit. Is the resistance below 5.0 ohms? Yes → Repair the Ambient Temperature Sensor Signal circuit for a short to the Sensor Return circuit. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
BUS MESSAGES MISSING

When Monitored and Set Condition:

BUS MESSAGES MISSING

When Monitored: While the EVIC is performing a series of tests on the microprocessor, compass coil, and internal circuitry.

Set Condition: This code will set during the self test if the EVIC does not receive PCI Bus messages from the BCM, MIC, or PCM.

POSSIBLE CAUSES
NO RESPONSE - PCI BUS - BCM
NO RESPONSE - PCI BUS - PCM
NO REPONSE - PCI BUS - MIC
ELECTRONIC VEHICLE INFORMATION CENTER

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, attempt to communicate with the BCM. Was the DRBIII® able to I/D or communicate with the BCM? Yes → Go To 2 No → Refer to COMMUNICATION category for the related symptom. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition on. With the DRBIII®, select Body Controller, then System Test. Does the DRBIII® display PCM Active on the Bus? Yes → Go To 3 No → Refer to COMMUNICATION category for the related symptom. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition on. With the DRBIII®, select Electro/Mechanical Instrument Cluster. Is there a response from the Instrument Cluster? Yes → Replace and program the Electronic Vehicle Information Center in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Refer to COMMUNICATION category for the related symptom. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
COMPASS TEST FAILURE

POSSIBLE CAUSES
ELECTRONIC VEHICLE INFORMATION CENTER

TEST	ACTION	APPLICABILITY
1	Perform the EVIC self test. Turn the ignition off. Depress and hold the RESET and C/T buttons while turning the ignition on. **NOTE: This test may also be performed using the DRBIII®.** Does the EVIC or DRBIII® display "FAILED SELF TEST"? Yes → Replace the EVIC in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
COOLANT LEVEL SWITCH CIRCUIT OPEN - GAS ONLY

When Monitored and Set Condition:

COOLANT LEVEL SWITCH CIRCUIT OPEN - GAS ONLY

When Monitored: With the ignition on.

Set Condition: The BCM detects the Coolant Level Sensor Signal voltage is above 4.8 volts for 5 seconds or more.

POSSIBLE CAUSES
COOLANT LEVEL SENSOR
COOLANT LEVEL SENSOR GROUND CIRCUIT OPEN
COOLANT LEVEL SENSE CIRCUIT OPEN
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the Coolant Level Sensor harness connector. Turn the ignition on. With the DRBIII, read the Coolant Level Sensor status. Connect a jumper wire between the Coolant Level Sense circuit and the Ground circuit. With the DRBIII, monitor the Coolant Level Sensor voltage. Does the DRBIII display 0.0 volts? Yes → Replace the Coolant Level Sensor. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the Coolant Level Sensor harness connector. Measure the resistance between ground and the Coolant Level Sensor Ground circuit. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the Coolant Level Sensor Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

COOLANT LEVEL SWITCH CIRCUIT OPEN - GAS ONLY — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Coolant Level Sensor harness connector. Disconnect the BCM C2 harness connector. Measure the resistance of the Coolant Level Sense circuit between the Coolant Level Sensor harness connector and the BCM C2 harness connector. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Coolant Level Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
DEMAGNETIZE COMPASS

POSSIBLE CAUSES
DEMAGNETIZE COMPASS

TEST	ACTION	APPLICABILITY
1	**NOTE: A blank compass display indicates that vehicle demagnetizing is required.** **NOTE: After demagnetizing, the vehicle will enter Auto Fast-Cal when the ignition is turned on.** **NOTE: Ensure that the correct compass variance is stored in the compass memory. See ″Setting Compass Variance″ in the Service Information.** Refer to the Service Information for the Demagnetizing Procedure. View repair for Verification Test. Repair When the Demagnetizing Procedure is complete perform the Verification Test. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
EVIC INTERNAL FAILURE

When Monitored and Set Condition:

EVIC INTERNAL FAILURE

When Monitored: When a SELF TEST command is received from the DRBIII, the EVIC performs a series of tests on the microprocessor, compass coil, and internal circuitry.

Set Condition: This code will be set during the self test if the EVIC detects a problem the microprocessor, compass coil, or internal circuitry.

POSSIBLE CAUSES
ELECTRONIC VEHICLE INFORMATION CENTER

TEST	ACTION	APPLICABILITY
1	Perform the EVIC Self Test. Turn the ignition off. Press and hold the C/T button and the RESET button. Turn the ignition on. **NOTE: The EVIC Self Test can also be performed using the DRBIII®.** Turn the ignition on. With the DRBIII®, select body, VIC, System Test, then Self Test. Observe the EVIC display following the Self Test. When the trouble code EVIC INTERNAL FAILURE is displayed, View repair. If there are no possible causes remaining, view repair. Repair Replace and program the Electronic Vehicle Information Center in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:

NO BCM MESSAGES RECEIVED

POSSIBLE CAUSES
DTC PRESENT
NO RESPONSE - PCI BUS - BCM
ELECTRONIC VEHICLE INFORMATION CENTER

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase DTCs. Cycle the ignition and wait approximately 1 minute. With the DRBIII®, read DTCs. Did this DTC reset? Yes → Go To 2 No → The condition is not present at this time. Monitor DRBIII® parameters while wiggling the related wire harness. refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition on. With the DRBIII®, attempt to I/D or communicate with the BCM. Was the DRBIII® able to communicate with the BCM? Yes → Replace the EVIC in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Refer to the COMMUNICATION category and perform the appropriate symptom. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
NO PCM MESSAGES RECEIVED

POSSIBLE CAUSES
DTC PRESENT
NO RESPONSE - PCI BUS - PCM
ELECTRONIC VEHICLE INFORMATION CENTER

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase DTCs. Cycle the ignition and wait approximately 1 minute. With the DRBIII®, read DTCs. Did this DTC reset? Yes → Go To 2 No → The condition is not present at this time. Monitor DRBIII® parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition on. With the DRBIII®, enter Body Computer, System Tests, then PCM Monitor. Does the DRBIII® display PCM Active on the Bus? Yes → Replace the EVIC in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Refer to the COMMUNICATION category and perform the appropriate symptom. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
SET COMPASS VARIANCE AS PER SERVICE INFORMATION

POSSIBLE CAUSES
SET COMPASS VARIANCE

TEST	ACTION	APPLICABILITY
1	Refer to the Service Information for the Compass Variance procedure. View repair for the Verification Test. Repair When the Compass Variance procedure is complete perform the Verification Test. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
WASHER FLUID SWITCH FAILURE

POSSIBLE CAUSES
WASHER FLUID LEVEL SWITCH
WASHER FLUID LEVEL SWITCH GROUND CIRCUIT OPEN
WASHER FLUID LEVEL SWITCH SENSE CIRCUIT OPEN
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the Washer Fluid Level Switch harness connector. Measure the resistance of the Washer Fluid Level Switch between pin 1 and pin 2. Does the resistance measure greater than 3000 ohms? Yes → Replace the Washer Fluid Level Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the Washer Fluid Level Switch harness connector. Measure the resistance between ground and the Washer Fluid Level Switch Ground circuit. Is the resistance above 5.0 ohms? Yes → Repair the Washer Fluid Level Switch Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the Washer Fluid Level Switch harness connector. Disconnect the BCM C2 harness connector. Measure the resistance of the Washer Fluid Switch Sense circuit between the Switch connector and the BCM connector. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Washer Fluid Level Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom List:

***AVERAGE FUEL ECONOMY INACCURATE OR WRONG**
***DISTANCE TO EMPTY INACCURATE OR WRONG**
***DISTANCE TO SERVICE INACCURATE OR WRONG**
***ELAPSED IGNITION ON TIME INACCURATE OR WRONG**
***INSTANT FUEL ECONOMY INACCURATE OR WRONG**
***TRIP ODOMETER INACCURATE OR WRONG**

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be *AVERAGE FUEL ECONOMY INACCURATE OR WRONG.

POSSIBLE CAUSES
BODY CONTROL MODULE
ELECTRONIC VEHICLE INFORMATION CENTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Diagnose and repair any BCM, PCM, or Communication DTCs before proceeding with this test.** **NOTE: Verify the following for proper operation: Fuel Injector Pulse Rate, Speed Signal input, Fuel Level input, correct Tire size and inflation.** Perform the EVIC Self Test. The self test can be performed with the DRBIII® or manually using the following procedure: Turn the ignition off. Press and hold the RESET and C/T buttons. Turn the ignition on. Continue to hold both buttons until the software version is displayed, then release the buttons. Observe the EVIC display when the self test is complete. Did the EVIC display ″FAILED SELF TEST″? Yes → Replace the EVIC in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → Replace and program the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*EVIC DIMMING INOPERATIVE

POSSIBLE CAUSES
ILLUMINATION BULB OR SOCKET
ELECTRONIC VEHICLE INFORMATION CENTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Diagnose and repair any BCM, EVIC, or Communication DTCs before proceeding with this test.** Turn the ignition off. Remove and inspect the illumination bulb(s) that is inoperative. Is there a problem with the bulb or socket? Yes → Replace the illumination bulb(s) or socket(s) as necessary. Perform BODY VERIFICATION TEST - VER 1. No → Replace, program, and calibrate the EVIC in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*EVIC INOPERATIVE

POSSIBLE CAUSES
FUSED B(+) CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
GROUND CIRCUIT OPEN
ELECTRONIC VEHICLE INFORMATION CENTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Diagnose and repair any BCM, PCM, or COMMUNICATION DTCs before proceeding.** Turn the ignition off. Disconnect the Overhead Console harness connector. Measure the voltage between the Fused B+ circuit and ground. Is the voltage above 10.5 volts? Yes → Go To 2 No → Repair the Fused B+ circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Overhead Console harness connector. Turn the ignition on. Measure the voltage between the Fused Ignition Switch Output circuit and ground. Is the voltage below 10.5 volts? Yes → Repair the Fused Ignition Switch Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the Overhead Console harness connector. Measure the resistance between ground and the EVIC ground circuit. Is the resistance above 5.0 ohms? Yes → Repair the Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1. No → Replace the EVIC in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*LOW COOLANT WARNING ALWAYS ON - GAS ONLY

POSSIBLE CAUSES
COOLANT LEVEL
COOLANT LEVEL SWITCH SHORTED
COOLANT LEVEL SWITCH SENSE CIRCUIT SHORT TO GROUND
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure that the cooling system operates properly before proceeding with this test.** **NOTE: Diagnose and repair any BCM, EVIC, PCM, or Communication DTCs before proceeding with this test.** Inspect the coolant fluid level. Is the coolant filled to the proper level and the cooling system operating properly? Yes → Go To 2 No → Repair as necessary. Perform BODY VERIFICATION TEST - VER 1.	All
2	Disconnect the Coolant Level Switch harness connector. Turn the ignition on. With the DRBIII®, read the ″Coolant Level Sw″ voltage. Does the DRBIII® display voltage above 4.5? Yes → Replace the Coolant Level Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Disconnect the Coolant Level Sensor harness connector. Disconnect the Body Control Module C2 harness connector. Measure the resistance of the Coolant Level Switch Sense circuit between the Coolant Level Switch connector and ground. Is the resistance below 5.0 ohms? Yes → Repair the Coolant Level Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*LOW WASHER FLUID MESSAGE ALWAYS ON

POSSIBLE CAUSES
WASHER FLUID LEVEL SWITCH
WASHER FLUID LEVEL SWITCH SENSE CIRCUIT SHORT TO GROUND
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	**NOTE: Diagnose and repair any BCM or Communication DTCs before proceeding with this test.** Turn the ignition off. Disconnect the Washer Fluid Level Switch harness connector. Turn the ignition on. With the DRBIII select the Body, Body Computer, and then Sensors. With the DRBIII®, read the Washer Fluid Level Switch voltage. Is the Washer Fluid Level Switch voltage above 5.0 volts? Yes → Replace the Washer Fluid Level Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the Washer Fluid Level Switch harness connector. Disconnect the BCM C2 harness connector. Measure the resistance between ground and the Washer Fluid Level Switch Sense circuit. Is the resistance below 5.0 ohms? Yes → Repair the Washer Fluid Level Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*TEMPERATURE DISPLAY INACCURATE OR INOPERATIVE

POSSIBLE CAUSES
AMBIENT TEMPERATURE SENSOR
ELECTRONIC VEHICLE INFORMATION CENTER

TEST	ACTION	APPLICABILITY
1	**NOTE: Diagnose and repair any BCM, EVIC, PCM, or Communication DTCs before proceeding with this test.** **NOTE: The Ambient Temperature Sensor is hardwired to the BCM. Ambient temperature information is transmitted to the EVIC via the PCI Bus.** Turn the ignition off. Disconnect the Ambient Temperature Sensor harness connector. Measure the resistance of the Ambient Temperature Sensor using the following temperature/resistance values: 10°C (50°F) Sensor Resistance = 17.99 - 21.81 Kilohms 20°C (68°F) Sensor Resistance = 11.37 - 13.61 Kilohms 25°C (77°F) Sensor Resistance = 9.12 - 10.88 Kilohms 30°C (86°F) Sensor Resistance = 7.37 - 8.75 Kilohms 40°C (104°F) Sensor Resistance = 4.90 - 5.75 Kilohms 50°C (122°F) Sensor Resistance = 3.33 - 3.88 Kilohms Is the Ambient Temperature Sensor resistance measurement within the min/max specifications? Yes → Go To 2 No → Replace the Ambient Temperature Sensor. Perform BODY VERIFICATION TEST - VER 1.	All
2	Perform the EVIC self test. Turn the ignition off. Press and hold the C/T and Reset buttons. Turn the ignition on. **NOTE: The self test can also be performed using the DRBIII®.** Observe the EVIC display at the conclusion of the self test. Does the EVIC display ″Passed Self Test″? Yes → Test Complete. No → Replace the EVIC in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*ALL DOORS (EXCEPT DRIVER FAIL TO LOCK/UNLOCK

POSSIBLE CAUSES
OPEN DOOR LOCK DRIVER WIRE
OPEN DOOR UNLOCK DRIVER WIRE
PDM - LOCK/UNLOCK OPEN

TEST	ACTION	APPLICABILITY
1	Remove the inner door trim panel to gain access to the Door Lock Motor/Ajar Switch connector. Disconnect the Door Lock Motor/Ajar Switch connector. Disconnect the Passenger Door Module ″C1″ connector. Measure the resistance of the Door Lock Driver circuit between the PDM connector and the door lock motor connector. Is the resistance below 5.0 ohms? Yes → Go To 2 No → Repair the open Door Lock Driver wire. Perform BODY VERIFICATION TEST - VER 1.	All
2	Remove the inner door trim panel to gain access to the Door Lock Motor/Ajar Switch connector. Disconnect the Door Lock Motor/Ajar Switch connector. Disconnect the Passenger Door Module ″C1″ connector. Measure the resistance of the Door Unlock Driver circuit between the PDM connector and the door lock motor connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open Door Unlock Driver wire. Perform BODY VERIFICATION TEST - VER 1.	All
3	If there are no possible causes remaining, view Repair. Repair Replace the Passenger Door Module Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*ALL DOORS (EXCEPT DRIVER) FAIL TO LOCK

POSSIBLE CAUSES
DOOR LOCK DRIVER WIRE SHORT TO GROUND
PASSENGER DOOR MODULE - PASSENGER DOORS FAIL TO LOCK

TEST	ACTION	APPLICABILITY
1	Remove the inner door trim panel to gain access to the Passenger Door Module connector. Disconnect the Passenger Door Module ″C1″ connector. Measure the resistance of the Door Lock Driver Ckt to body ground. Is the resistance below 20 ohms? Yes → Repair the Door Lock Driver Wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	If there are no possible causes remaining, view ″Repair″. Repair Replace the Passenger Door Module Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*ALL DOORS (EXCEPT DRIVER) FAILS TO UNLOCK

POSSIBLE CAUSES
DOOR UNLOCK DRIVER WIRE SHORT TO GND
PDM DEFECTIVE PASSENGER UNLOCK FAIL

TEST	ACTION	APPLICABILITY
1	Remove the inner door trim panel to gain access to the Passenger Door Module connector. Disconnect the Passenger Door Module ″C1″ connector. Measure the resistance of the Door Unlock Driver ckt to body ground. Is the resistance below 20 ohms? Yes → Repair the Door Unlock Driver Wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	If there are no possible causes remaining, view Repair. Repair Replace the Passenger Door Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*ALL LOCKS INOPERATIVE FROM DRIVER DOOR MODULE

POSSIBLE CAUSES
DDM BUS COMMUNICATON CHECK
DDM - LOCKS INOPERATIVE

TEST	ACTION	APPLICABILITY
1	With the DRBIII, select ″Body″, ″Door Modules″ Does the DRBIII display ″Part No.″ and ″Version No.″ of the Driver Door Module? Yes → Go To 2 No → Refer to symptom *BUS +/- SIGNALS OPEN FROM DRIVER DOOR MODULE in the COMMUNICATION category. Perform BODY VERIFICATION TEST - VER 1.	All
2	If there are no possible causes remaining, view Repair. Repair Replace the Driver Door Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*ALL LOCKS INOPERATIVE FROM PASSENGER DOOR MODULE

POSSIBLE CAUSES
PDM BUS COMMUNICATION CHECK
PDM DEFECTIVE LOCKS INOP

TEST	ACTION	APPLICABILITY
1	With the DRBIII, select ″Body″, ″Door Modules″ Does the DRBIII Display the ″Part No.″ and ″Version No.″ of the Passenger Door Module? Yes → Go To 2 No → Refer to symptom BUS +/- SIGNALS OPEN FROM PASSENGER DOOR MODULE in the COMMUNICATION category. Perform BODY VERIFICATION TEST - VER 1.	All
2	If there are no possible causes remaining, view Repair. Repair Replace the Passenger Door Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*AUTOMATIC DOOR LOCKS INOPERATIVE

POSSIBLE CAUSES
AUTO DOOR LOCKS NOT ENABLED
PCM DTC'S PRESENT
DRIVER DOOR MODULE - AUTO LOCKS INOPERATIVE

TEST	ACTION	APPLICABILITY
1	With the DRB, under ″CUSTOMER PREFERENCES″ read the ″Auto Door Lock″ status. Does the DRB show AUTO DOOR LOCKS ENABLED ? Yes → Go To 2 No → With the DRBIII, enable the Auto Door Locks and retest the System. Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRBIII®, read ENGINE DTC's. Are there any TPS or VEHICLE SPEED DTC's present? Yes → Refer to DRIVEABILITY for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	If there are no possible causes remaining, view Repair. Repair Replace the Driver Door Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*DOORS LOCK WITH KEY IN IGNITION & FRONT DOOR OPEN

POSSIBLE CAUSES
DRIVER DOOR AJAR SWITCH STATUS INCORRECT
KEY-IN IGNITION SWITCH GROUND CIRCUIT OPEN
KEY-IN IGNITION SWITCH SENSE CIRCUIT OPEN
IGNITION SWITCH OPEN
BCM - DOOR LOCK INHIBIT OPEN
BODY CONTROL MODULE - KEY-IN IGNITION OPEN

TEST	ACTION	APPLICABILITY
1	**Note: Ensure that the Key is still in the Ignition Switch.** With the DRB, read the Key-In Ignition status. Does the DRB show KEY-IN IGN: CLOSED ? No → Go To 2 Yes → Go To 6	All
2	Turn the ignition off. Disconnect the Ignition Switch C2 connector. Turn all lights off. Measure the resistance of the Ground circuit in the ignition switch ″C2″ connector. Is the resistance below 5.0 ohms ? Yes → Go To 3 No → Repair the open ground circuit. Perform BODY VERIFICATION TEST - VER 1.	All
3	Disconnect the Ignition Switch ″C2″ connector. Disconnect the Body Control Module ″C1″ connector. Measure the resistance of the Key-In Ignition Switch Sense circuit between the ignition switch ″C2″ connector and the BCM ″C1″ connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open Key-In Ignition Switch Sense Circuit. Perform BODY VERIFICATION TEST - VER 1.	All
4	Disconnect the Ignition Switch ″C2″ connector. Connect a jumper between the Key-In Ignition Switch Sense and Ground Circuits in the Ignition Switch ″C2″ Connector. With the DRB, read the Key-In Ignition status. Does the DRB show KEY-IN IGN: CLOSED ? Yes → Replace the Ignition Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All

*DOORS LOCK WITH KEY IN IGNITION & FRONT DOOR OPEN — Continued

TEST	ACTION	APPLICABILITY
5	If there are no possible causes remaining, view Repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All
6	Open the Drivers door. With the DRB III select: ″Body″, ″Door Modules″, ″Input/Output″ Read the ″Drv Door Ajar Sw″ state. Does the DRB III Show: ″CLOSED″? Yes → Go To 7 No → Refer to symptom DRIVER DOOR AJAR CIRCUIT OPEN in the DOOR AJAR category. Perform BODY VERIFICATION TEST - VER 1.	All
7	If there are no possible causes remaining, view Repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*DRIVER DOOR FAILS TO LOCK

POSSIBLE CAUSES
DRIVER DOOR LOCK DRIVER SHORT TO GND
DDM - DRIVER DOOR LOCK OPEN

TEST	ACTION	APPLICABILITY
1	Remove the inner door trim panel to gain access to the Driver Door Module ″C1″ connector. Disconnect the Driver Door Module ″C1″ connector. Measure the resistance of the Door LOCK Driver circuit in the driver door module ″C1″ connector to body ground. Is the resistance below 20 ohms? Yes → Repair the Driver Door Lock Driver wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	If there are no possible causes remaining, view Repair. Repair Replace the Driver Door Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*DRIVER DOOR FAILS TO LOCK & UNLOCK

POSSIBLE CAUSES
DRIVER DOOR MODULE - OPEN DOOR LOCK DRIVER
DRIVER DOOR UNLOCK DRIVER WIRE OPEN
OPEN DRIVER DOOR LOCK DRIVER WIRE
DOOR LOCK MOTOR OPEN

TEST	ACTION	APPLICABILITY
1	Remove the inner door trim panel to gain access to the Driver Door Module. Disconnect the Driver Door Module ″C1″ connector. Ensure the drivers window is down and the door lock is LOCKED. Connect a jumper wire between the Door Lock Driver ckt and the Ground ckt in the ″C1″ connector. Connect a jumper wire to the Driver Door Unlock Driver ckt and momentarilly touch it to the Fused B(+) ckt and observe the door lock. Did the drivers door UNLOCK? Yes → Replace the Driver Door Module. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Remove the inner door trim panel to gain access to the Door Lock Motor/Ajar Switch connector. Disconnect the Driver Door Module ″C1″ connector. Disconnect the Door Lock Motor/Ajar Switch connector. Measure the resistance of the Driver Door Unlock Driver circuit between the DDM connector and the door lock motor connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open Driver Door Unlock Driver wire. Perform BODY VERIFICATION TEST - VER 1.	All
3	Remove the inner door trim panel to gain access to the Door Lock Motor/Ajar Switch connector. Disconnect the Driver Door Module ″C1″ connector. Disconnect the Door Lock Motor/Ajar Switch connector. Measure the resistance of the Driver Door LOCK Driver circuit between the DDM connector and the door lock motor connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open Driver Door Lock Driver Wire. Perform BODY VERIFICATION TEST - VER 1.	All
4	If there are no possible causes remaining, view repair. Repair Replace the Door Lock Motor. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*DRIVER DOOR FAILS TO UNLOCK

POSSIBLE CAUSES
DRIVER DOOR UNLOCK DRIVER WIRE SHORT TO GND
DDM - DRIVER DOOR UNLOCK OPEN

TEST	ACTION	APPLICABILITY
1	Remove the inner door trim panel to gain access to the Driver Door Module ″C1″ connector. Disconnect the Driver Door Module ″C1″ connector. Measure the resistance of the Driver Door UNLOCK Driver circuit in the driver door module ″C1″ connector to body ground. Is the resistance below 20 ohms? Yes → Repair the Driver Door Unlock Driver Wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	If there are no possible causes remaining, view Repair. Repair Replace the Driver Door Module Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*LEFT REAR DOOR FAILS TO LOCK & UNLOCK

POSSIBLE CAUSES
OPEN DOOR LOCK MOTOR
OPEN DOOR LOCK DRIVER WIRE
OPEN DOOR UNLOCK DRIVER WIRE

TEST	ACTION	APPLICABILITY
1	Remove the inner door trim panel to gain access to the Door Lock Motor/Ajar Switch connector. Disconnect the Left Rear Door Lock Motor/Ajar Switch connector. Ensure the Passenger Door Module ″C1″ connector is connected. Connect a test light between the Door Lock Driver and the Door Unlock Driver terminals in the left rear door lock motor/ajar connector. With the DRB III actuate the ″Pas Lock Relay″ and then the ″Pas Unlock Relay″ and observe the test light. Did the test light illuminate when the lock was actuated in both directions? Yes → Replace the Door Lock Motor. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Remove the inner door trim panel to gain access to the Door Lock Motor/Ajar Switch connector. Disconnect the Door Lock Motor/Ajar Switch connector. Disconnect the Passenger Door Module ″C1″ connector. Measure the resistance of the Door Lock Driver circuit between the PDM C1 connector and the door lock motor connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open Door Lock Driver wire. Perform BODY VERIFICATION TEST - VER 1.	All
3	Remove the inner door trim panel to gain access to the Door Lock Motor/Ajar Switch connector. Disconnect the Door Lock Motor/Ajar Switch connector. Disconnect the Passenger Door Module ″C1″ connector. Measure the resistance of the Door Unlock Driver circuit between the PDM connector and the door lock motor connector. Is the resistance below 5.0 ohms? Yes → Test Complete. No → Repair the open Door Unlock Driver wire. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*LIFTGATE LOCK FAILS TO LOCK/UNLOCK

POSSIBLE CAUSES
OPEN LIFTGATE LOCK MOTOR
OPEN DOOR LOCK DRIVER WIRE
OPEN DOOR UNLOCK DRIVER WIRE

TEST	ACTION	APPLICABILITY
1	Remove the liftgate inner door trim panel to gain access to the Liftgate Lock Motor connector. Disconnect the Liftgate Lock Motor connector. **Note: Ensure the Passenger Door Module ″C1″ connector is connected.** Connect a test light between the Door Lock Driver and the Door Unlock Driver terminals in the liftgate lock motor connector. With the DRB III actuate the ″Pas Lock Relay″ and then the ″Pas Unlock Relay″ and observe the test light. Did the test light illuminate when the lock was actuated in both directions? Yes → Replace the Liftgate Lock Motor. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Remove the liftgate inner door trim panel to gain access to the Liftgate Lock Motor connector. Disconnect the Liftgate Lock Motor connector. Disconnect the Passenger Door Module ″C1″ connector. Measure the resistance of the Door Lock Driver ckt between the PDM connector and the liftgate lock motor connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open Door Lock Driver wire. Perform BODY VERIFICATION TEST - VER 1.	All
3	Remove the liftgate inner door trim panel to gain access to the Liftgate Lock Motor connector. Disconnect the Liftgate Lock Motor connector. Disconnect the Passenger Door Module ″C1″ connector. Measure the resistance of the Door Unlock Driver ckt between the PDM connector and the liftgate lock motor connector. Is the resistance below 5.0 ohms? Yes → Test Complete. No → Repair the open Door Unlock Driver wire. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*PASSENGER DOOR FAILS TO LOCK & UNLOCK

POSSIBLE CAUSES
OPEN DOOR LOCK MOTOR
OPEN DOOR LOCK DRIVER WIRE
OPEN DOOR UNLOCK DRIVER WIRE

TEST	ACTION	APPLICABILITY
1	Remove the inner door trim panel to gain access to the Door Lock Motor/Ajar Switch connector. Disconnect the Door Lock Motor/Ajar Switch connector. **Note: Ensure the Passenger Door Module ″C1″ connector is connected.** Connect a test light between the Door Lock Driver and the Door Unlock Driver terminals in the passenger door lock motor/ajar connector. With the DRB III actuate the ″Pas Lock Relay″ and then the ″Pas Unlock Relay″ and observe the test light. Did the test light illuminate when the lock was actuated in both directions? Yes → Replace the Door Lock Motor. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Remove the inner door trim panel to gain access to the Door Lock Motor/Ajar Switch connector. Disconnect the Door Lock Motor/Ajar Switch connector. Disconnect the Passenger Door Module ″C1″ connector. Measure the resistance of the Door Lock Driver circuit between the PDM connector and the door lock motor connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open Door Lock Driver wire. Perform BODY VERIFICATION TEST - VER 1.	All
3	Remove the inner door trim panel to gain access to the Door Lock Motor/Ajar Switch connector. Disconnect the Door Lock Motor/Ajar Switch connector. Disconnect the Passenger Door Module ″C1″ connector. Measure the resistance of the Door Unlock Driver circuit between the PDM connector and the door lock motor connector. Is the resistance below 5.0 ohms? Yes → Test Complete. No → Repair the open Door Unlock Driver wire. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*RIGHT REAR DOOR FAILS TO LOCK & UNLOCK

POSSIBLE CAUSES
OPEN DOOR LOCK MOTOR
OPEN DOOR LOCK DRIVER WIRE
OPEN DOOR UNLOCK DRIVER WIRE

TEST	ACTION	APPLICABILITY
1	Remove the inner door trim panel to gain access to the Door Lock Motor/Ajar Switch connector. Disconnect the Right Rear Door Lock Motor/Ajar Switch connector. Ensure the Passenger Door Module ″C1″ connector is connected. Connect a test light between the Door Lock Driver and the Door Unlock Driver terminals in the right rear door lock motor/ajar connector. With the DRB III actuate the ″Pas Lock Relay″ and then the ″Pas Unlock Relay″ and observe the test light. Did the test light illuminate when the lock was actuated in both directions? Yes → Replace the Right Rear Door Lock Motor. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Remove the inner door trim panel to gain access to the Door Lock Motor/Ajar Switch connector. Disconnect the Right Rear Door Lock Motor/Ajar Switch connector. Disconnect the Passenger Door Module ″C1″ connector. Measure the resistance of the Door Lock Driver circuit between the PDM connector and the door lock motor connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open Door Lock Driver wire. Perform BODY VERIFICATION TEST - VER 1.	All
3	Remove the inner door trim panel to gain access to the Door Lock Motor/Ajar Switch connector. Disconnect the Door Lock Motor/Ajar Switch connector. Disconnect the Passenger Door Module ″C1″ connector. Measure the resistance of the Door Unlock Driver circuit between the PDM connector and the right rear door lock motor connector. Is the resistance below 5.0 ohms? Yes → Test Complete. No → Repair the open Door Unlock Driver wire. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*RKE INOPERATIVE - JAPAN ONLY

POSSIBLE CAUSES
GROUND CIRCUIT OPEN
FUSED B(+) CIRCUIT OPEN
DIAGNOSTIC OUT CIRCUIT SHORT TO GROUND
DIAGNOSTIC OUT CIRCUIT OPEN
DRIVER DOOR MODULE - RKE INOPERATIVE
REMOTE KEYLESS ENTRY MODULE - OPEN

TEST	ACTION	APPLICABILITY
1	Remove the driver door trim panel. Disconnect the Remote Keyless Entry module (located near the DDM). Key off. Turn all lights off. Measure the resistance between ground and the Ground circuit. Is the resistance below 10.0 ohms? Yes → Go To 2 No → Repair the open Ground circuit. Perform BODY VERIFICATION TEST - VER 1.	All
2	Remove the driver door trim panel. Disconnect the Remote Keyless Entry module (located near the DDM). Measure the voltage between Fused B(+) circuit and ground. Is the voltage above 10.0 volts? Yes → Go To 3 No → Repair the open Fused B(+) circuit. Perform BODY VERIFICATION TEST - VER 1.	All
3	Remove the driver door trim panel. Disconnect the Remote Keyless Entry module (located near the DDM). Disconnect the Driver Door Module ″C1″ connector. Measure the resistance between ground and the Diagnostic Out circuits (cavities 5 & 6). Is the resistance below 1000.0 (1K) ohms? Yes → Repair the Diagnostic Out circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Remove the driver door trim panel. Disconnect the Remote Keyless Entry module (located near the DDM). Disconnect the Driver Door Module ″C1″ connector. Measure the resistance of the Diagnostic Out circuit between the RKE module connector (cavities 5 & 6) and the DDM connector (cavity 8). Is the resistance below 5.0 ohms at all terminals? Yes → Go To 5 No → Repair the open Diagnostic Out circuit. Perform BODY VERIFICATION TEST - VER 1.	All

*RKE INOPERATIVE - JAPAN ONLY — Continued

TEST	ACTION	APPLICABILITY
5	Remove the driver door trim panel. Disconnect the Remote Keyless Entry module (located near the DDM). Measure the voltage of the Diagnostic Out circuit in the RKE connector. Is the voltage between 4.8 and 5.2 vol6ts? Yes → Go To 6 No → Replace the Driver Door Module. Perform BODY VERIFICATION TEST - VER 1.	All
6	If there are no possible causes remaining, view repair. Repair Replace the Remote Keyless Entry Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*RKE TRANSMITTER INOPERATIVE

POSSIBLE CAUSES
RKE TRANSMITTER BATTERY VOLTAGE LOW
RKE TRANSMITTER NOT PROGRAMMED
RKE TRANSMITTER DEFECTIVE
PASSENGER DOOR MODULE DEFECTIVE RKE INOP

TEST	ACTION	APPLICABILITY
1	Remove the batteries from the transmitter. Using a voltmeter, test the Batteries. Is the voltage above 3.0 volts in each battery? Yes → Go To 2 No → Replace the Batteries. Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRB select BODY, DOOR MODULES, MISCELLANEOUS, then PROGRAM RKE. Follow instructions on the screen. Exit PROGRAM RKE. Try the Door Locks using the Transmitter. Did the Door Locks respond properly to the Transmitter commands ? Yes → Repair complete. Using the DRB, program all other Transmitters used with this Vehicle. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Secure a known good Transmitter. Using the DRB select BODY, DOOR MODULES, MISCELLANOUS then PROGRAM RKE. Follow the instructions on the DRB screen. Exit PROGRAM RKE. Try the Door Locks using the Transmitter. Did the Door Locks respond properly to the Transmitter commands ? Yes → Replace the Transmitter. Program all Transmitters that will be used with this Vehicle. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4 **Note: When repairs are complete ensure all transmitters used with this vehicle are programmed**	All
4	If there are no possible causes remaining, view Repair. Repair Replace the Passenger Door Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*RKE TRANSMITTER POOR RANGE - JAPAN ONLY

POSSIBLE CAUSES
ANTENNA SIGNAL CIRCUIT OPEN
REMOTE KEYLESS ENTRY MODULE - POOR RANGE

TEST	ACTION	APPLICABILITY
1	Remove the driver door trim panel. Disconnect the Remote Keyless Entry module (located near the DDM). Measure the resistance of the Antenna Signal circuit between caities 1 & 2. Is the resistance below 1.0 ohm? Yes → Go To 2 No → Repair the open Antenna Signal circuit. Perform BODY VERIFICATION TEST - VER 1.	All
2	If there are no possible causes remaining, view repair. Repair Replace the Remote Keyless Entry Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*BOTH MEMORY MIRRORS INOPERATIVE

POSSIBLE CAUSES
BOTH MEMORY MIRRORS INOPERATIVE

TEST	ACTION	APPLICABILITY
1	Ensure the memory seat operates properly before continuing. If not, refer to symptom list for problems related to MEMORY SYSTEM.. If there are no possible causes remaining, view repair. Repair Replace the Driver Door Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
***DRIVER MEMORY MIRROR INOPERATIVE**

POSSIBLE CAUSES
DRIVER MIRROR SENSOR GROUND WIRE OPEN
DRIVER DOOR MODULE - SENSOR GROUND OPEN
DRIVER MIRROR SENSOR GROUND SHORTED TO MIRROR VERTICAL POSITION SIGNAL
DRIVER MIRROR SENSOR GROUND SHORTED TO MIRROR HORIZONTAL POSITION SIGNAL
DRIVER DOOR MODULE - MEMORY MIRROR OPEN
DRIVER MIRROR HORIZONTAL POSITION SIGNAL SHORT TO GROUND
DRIVER MIRROR VERTICAL POSITION SIGNAL SHORT TO GROUND
DRIVER MIRROR HORIZONTAL POSITION SIGNAL WIRE OPEN
DRIVER MIRROR VERTICAL POSITION SIGNAL WIRE OPEN
DRIVER POWER MIRROR - MEMORY OPEN
DRIVER DOOR MODULE - MEMORY CIRCUIT OPEN

TEST	ACTION	APPLICABILITY
1	**Note: The following list of items should be checked before continuing with any power mirror tests.** Ensure door ajar switches are working properly before proceeding. Ensure there is communication with the DDM, PDM and the BCM before proceeding. Ensure the mirror directional switches are working properly before proceeding. If not, replace the DDM. Ensure the mirror select switch is working properly before proceeding. If not, replace the DDM. Ensure both mirrors are operational from the DDM. If not, refer to SERVICE INFORMATION. If all items are operational, continue. Continue Go To 2	All
2	With the DRBIII® read the Drv Mirror Horiz Volts. Operate the mirror from left to right and observe the DRB. Does the voltage vary from approximately 1.0 to 4.0 volts? Yes → Go To 3 No → Go To 5	All
3	With the DRBIII® read the Drv Mirror Vert Volts. Operate the mirror from down to up and observe the DRB. Does the voltage vary from approximately 1.0 to 4.0 volts? Yes → Go To 4 No → Go To 5	All

*DRIVER MEMORY MIRROR INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
4	If there are no possible causes remaining, view repair. Repair Replace the Driver Door Module. Perform BODY VERIFICATION TEST - VER 1.	All
5	Disconnect the Driver Power Mirror connector. Disconnect the DDM C2 connector. Measure the resistance of the Mirror Sensor Ground wire between the Driver Power Mirror connector and the DDM C2 connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the open Mirror Sensor Ground wire. Perform BODY VERIFICATION TEST - VER 1.	All
6	Disconnect the Driver Power Mirror connector. Ensure the DDM C2 connector is connected at this time. Turn ignition off. Turn all lights off. Measure the resistance between ground and the Mirror Sensor Ground circuit in the Driver Power Mirror connector.. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Replace the Driver Door Module. Perform BODY VERIFICATION TEST - VER 1.	All
7	Disconnect the Driver Power Mirror connector. Measure the voltage between Mirror Horizontal Position Signal circuit and ground. Is the voltage approximately 5.0 volts? Yes → Go To 8 No → Go To 10	All
8	Disconnect the Driver Power Mirror connector. Measure the voltage between Mirror Vertical Position Signal circuit and ground. Is the voltage approximately 5.0 volts? Yes → Go To 9 No → Go To 10	All
9	If there are no possible causes remaining, view repair. Repair Replace the Driver Power Mirror. Perform BODY VERIFICATION TEST - VER 1.	All
10	Disconnect the DDM C2 connector. Disconnect the Driver Power Mirror connector. Measure the resistance between the Mirror Sensor Ground circuit and the Mirror Vertical Position Signal circuit in the DDM C2 connector. Is the resistance below 1000.0 ohms? Yes → Repair the Mirror Sensor Ground wire for a short to the Mirror Vertical Position Signal wire. Perform BODY VERIFICATION TEST - VER 1. No → Go To 11	All

*DRIVER MEMORY MIRROR INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
11	Disconnect the DDM C2 connector. Disconnect the Driver Power Mirror connector. Measure the resistance between the Mirror Sensor Ground circuit and the Mirror Horizontal Position Signal circuit in the DDM C2 connector. Is the resistance below 1000.0 ohms? Yes → Repair the Mirror Sensor Ground wire for a short to the Mirror Horizontal Position Signal wire. Perform BODY VERIFICATION TEST - VER 1. No → Go To 12	All
12	Disconnect the DDM C2 connector. Disconnect the Driver Power Mirror connector. Measure the resistance between ground and the Mirror Horizontal Position Signal circuit. Is the resistance below 1000.0 ohms? Yes → Repair the Mirror Horizontal Position Signal wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 13	All
13	Disconnect the DDM C2 connector. Disconnect the Driver Power Mirror connector. Measure the resistance between ground and the Mirror Vertical Position Signal circuit. Is the resistance below 1000.0 ohms? Yes → Repair the Mirror Vertical Position Signal wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 14	All
14	Disconnect the DDM C2 connector. Disconnect the Driver Power Mirror connector. Measure the resistance of the Mirror Horizontal Position Signal circuit between the DDM C2 connector and the Driver Power Mirror connector. Is the resistance below 5.0 ohms? Yes → Go To 15 No → Repair the open Mirror Horizontal Position Signal wire. Perform BODY VERIFICATION TEST - VER 1.	All
15	Disconnect the DDM C2 connector. Disconnect the Driver Power Mirror connector. Measure the resistance of the Mirror Vertical Position Signal circuit between the DDM C2 connector and the Driver Power Mirror connector. Is the resistance below 5.0 ohms? Yes → Go To 16 No → Repair the open Mirror Vertical Position Signal wire. Perform BODY VERIFICATION TEST - VER 1.	All
16	If there are no possible causes remaining, view repair. Repair Replace the Driver Door Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*FOLDING POWER MIRROR INOPERATIVE

POSSIBLE CAUSES
FOLDING MIRROR TEST
DRIVER POWER MIRROR - FOLDING MIRROR OPEN
PASSENGER FOLDAWAY MIRROR OPEN
POWER FOLDING MIRROR FEED WIRE OPEN
POWER FOLDING MIRROR FEED WIRE SHORTED TO GROUND
POWER FOLDING MIRROR RETURN WIRE OPEN
POWER FOLDING MIRROR RETURN WIRE SHORTED TO GROUND
DRIVER DOOR MODULE - FOLDING MIRROR OPEN
PASSENGER DOOR MODULE - FOLDAWAY MIRROR OPEN
BOTH FOLDING MIRRORS INOPERATIVE
DRIVER POWER MIRROR - SHORT TO GROUND
PASSENGER POWER MIRROR - SHORT TO GROUND

TEST	ACTION	APPLICABILITY
1	**Note: The following list of items should be checked before continuing with any power mirror tests.** Ensure door ajar switches are working properly before proceeding. If not OK, refer to symptom list for problems related to INTERIOR LIGHTING. Ensure there is communication with the DDM and the BCM before proceeding. If not OK, refer to symptom list for problems related to COMMUNICATION. Ensure the mirror directional switches are working properly before proceeding. If not, replace the DDM. Ensure the mirror select switch is working properly before proceeding. If not, replace the DDM. If all items are operational, continue. Continue Go To 2	All

*FOLDING POWER MIRROR INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
2	Ensure all doors are closed. Remove the key from the ignition switch. Operate the mirrors from the power foldaway switch and observe both mirrors. What did you observe. Neither mirror folded or opened. Replace the Driver Door Module. Perform BODY VERIFICATION TEST - VER 1. Driver mirror failed to fold or open. Go To 3 Passenger mirror failed to fold or open. Go To 11 Both mirrors folded and opened. Mirrors are operating properly at this time. Check for intermittent failure from doors and foldaway switches. Perform BODY VERIFICATION TEST - VER 1.	All
3	Key off. Disconnect the Driver Door Module C2 connector. Measure the resistance between ground and the Power Folding Mirror Feed circuit in the DDM C2 connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Go To 7	All
4	Key off. Disconnect the Passenger Door Module C2 connector. Disconnect the Passenger Power Mirror connector. Measure the resistance between ground and the Power Folding Mirror Feed wire in the PDM ″C2″ connector. Is the resistance below 5.0 ohms? Yes → Repair the Power Folding Mirror Feed wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Key off. Disconnect the Passenger Door Module C2 connector. Disconnect the Passenger Power Mirror connector. Measure the resistance between ground and the Power Folding Mirror Return wire in the PDM C2 connector. Is the resistance below 5.0 ohms? Yes → Repair the Power Folding Mirror Return wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	If there are no possible causes remaining, view repair. Repair Replace the Driver Power Mirror. Perform BODY VERIFICATION TEST - VER 1.	All

*FOLDING POWER MIRROR INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
7	Ensure the DDM C2 connector is connected at this time. Disconnect the Driver Power Mirror connector. Connect a 12-volt test light between the Power Folding Mirror Feed and the Power Folding Mirror Return circuits in the Driver Power Mirror connector. With the DRBIII® actuate Drv Foldaway In then the Drv Foldaway Out relays. Did the test light illuminate when the relays were activated in BOTH directions? Yes → Replace the Driver Foldaway Mirror. Perform BODY VERIFICATION TEST - VER 1. No → Go To 8	All
8	Key off. Disconnect the Passenger Door Module C2 connector. Disconnect the Passenger Power Mirror connector. Measure the resistance of the Power Folding Mirror Feed wire between the PDM C2 connector and the Passenger Power Mirror connector. Is the resistance below 5.0 ohms? Yes → Go To 9 No → Repair the open Power Folding Mirror Feed wire. Perform BODY VERIFICATION TEST - VER 1.	All
9	Key off. Disconnect the Passenger Door Module C2 connector. Disconnect the Passenger Power Mirror connector. Measure the resistance of the Power Folding Mirror Return wire between the PDM C2 connector and the Driver Power Mirror connector. Is the resistance below 5.0 ohms? Yes → Go To 10 No → Repair the open Power Folding Mirror Return wire. Perform BODY VERIFICATION TEST - VER 1.	All
10	If there are no possible causes remaining, view repair. Repair Replace the Driver Door Module. Perform BODY VERIFICATION TEST - VER 1.	All
11	Key off. Disconnect the Passenger Door Module C2 connector. Measure the resistance between ground and the Power Folding Mirror Feed circuit in the PDM C2 connector. Is the resistance below 5.0 ohms? Yes → Go To 12 No → Go To 15	All
12	Key off. Disconnect the Passenger Door Module C2 connector. Disconnect the Passenger Power Mirror connector. Measure the resistance between ground and the Power Folding Mirror Feed wire in the PDM ″C2″ connector. Is the resistance below 5.0 ohms? Yes → Repair the Power Folding Mirror Feed wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 13	All

*FOLDING POWER MIRROR INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
13	Key off. Disconnect the Passenger Door Module C2 connector. Disconnect the Passenger Power Mirror connector. Measure the resistance between ground and the Power Folding Mirror Return wire in the PDM C2 connector. Is the resistance below 5.0 ohms? Yes → Repair the Power Folding Mirror Return wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 14	All
14	If there are no possible causes remaining, view repair. Repair Replace the Passenger Power Mirror. Perform BODY VERIFICATION TEST - VER 1.	All
15	Ensure the PDM C2 connector is connected at this time. Disconnect the Passenger Power Mirror connector. Connect a 12-volt test light between the Power Folding Mirror Feed and the Power Folding Mirror Return circuits in the Passenger Power Mirror connector. With the DRBIII®, actuate ″Pas Foldaway In″ then the ″Pas Foldaway Out″ relays. Did the test light illuminate when the relays were activated in BOTH directions? Yes → Replace the Passenger Door Foldaway Mirror. Perform BODY VERIFICATION TEST - VER 1. No → Go To 16	All
16	Key off. Disconnect the Passenger Door Module C2 connector. Disconnect the Passenger Power Mirror connector. Measure the resistance of the Power Folding Mirror Feed wire between the PDM C2 connector and the Passenger Power Mirror connector. Is the resistance below 5.0 ohms? Yes → Go To 17 No → Repair the open Power Folding Mirror Feed wire. Perform BODY VERIFICATION TEST - VER 1.	All
17	Key off. Disconnect the Passenger Door Module C2 connector. Disconnect the Passenger Power Mirror connector. Measure the resistance of the Power Folding Mirror Return wire between the PDM C2 connector and the Driver Power Mirror connector. Is the resistance below 5.0 ohms? Yes → Go To 18 No → Repair the open Power Folding Mirror Return wire. Perform BODY VERIFICATION TEST - VER 1.	All
18	If there are no possible causes remaining, view repair. Repair Replace the Passenger Door Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*PASSENGER MEMORY MIRROR INOPERATIVE

POSSIBLE CAUSES
PASSENGER MIRROR SENSOR GROUND WIRE OPEN
PASSENGER DOOR MODULE - SENSOR GROUND OPEN
PASSENGER MIRROR SENSOR GROUND SHORTED TO MIRROR VERTICAL POSITION SIGNAL
PASSENGER MIRROR SENSOR GROUND SHORTED TO MIRROR HORIZONTAL POSITION SIGNAL
PASSENGER DOOR MODULE - MEMORY MIRROR OPEN
PASSENGER MIRROR HORIZONTAL POSITION SIGNAL SHORT TO GROUND
PASSENGER MIRROR VERTICAL POSITION SIGNAL SHORT TO GROUND
PASSENGER MIRROR HORIZONTAL POSITION SIGNAL WIRE OPEN
PASSENGER MIRROR VERTICAL POSITION SIGNAL WIRE OPEN
PASSENGER POWER MIRROR - MEMORY OPEN
PASSENGER DOOR MODULE - MEMORY CIRCUIT OPEN

TEST	ACTION	APPLICABILITY
1	**Note: The following list of items should be checked before continuing with any power mirror tests.** Ensure door ajar switches are working properly before proceeding. Ensure there is communication with the DDM, PDM and the BCM before proceeding. Ensure the mirror directional switches are working properly before proceeding. If not, replace the DDM. Ensure the mirror select switch is working properly before proceeding. If not, replace the DDM. Ensure both mirrors are operational from the DDM. If not, refer to SERVICE INFORMATION. If all items are operational, continue. Continue Go To 2	All
2	With the DRBIII® read the Pas Mirror Horiz Volts. Operate the mirror from left to right and observe the DRB. Does the voltage vary from approximately 1.0 to 4.0 volts? Yes → Go To 3 No → Go To 5	All
3	With the DRBIII®, read the Pas Mirror Vert Volts. Operate the mirror from down to up and observe the DRB. Does the voltage vary from approximately 1.0 to 4.0 volts? Yes → Go To 4 No → Go To 5	All

*PASSENGER MEMORY MIRROR INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
4	If there are no possible causes remaining, view repair. Repair Replace the Passenger Door Module. Perform BODY VERIFICATION TEST - VER 1.	All
5	Disconnect the Passenger Power Mirror connector. Disconnect the PDM C2 connector. Measure the resistance of the Mirror Sensor Ground wire between the PDM C2 connector and the Passenger Power Mirror connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the open Mirror Sensor Ground wire. Perform BODY VERIFICATION TEST - VER 1.	All
6	Ensure the PDM C2 connector is connected at this time. Disconnect the Passenger Power Mirror connector. Turn the ignition off. Turn all lights off. Measure the resistance between ground and the Mirror Sensor Ground circuit in the Passenger Power Mirror connector. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Replace the Passenger Door Module. Perform BODY VERIFICATION TEST - VER 1.	All
7	Disconnect the Passenger Power Mirror connector. Measure the voltage between Mirror Horizontal Position Signal circuit and ground. Is the voltage approximately 5.0 volts? Yes → Go To 8 No → Go To 10	All
8	Disconnect the Passenger Power Mirror connector. Measure the voltage between Mirror Vertical Position Signal circuit and ground. Is the voltage approximately 5.0 volts? Yes → Go To 9 No → Go To 10	All
9	If there are no possible causes remaining, view repair. Repair Replace the Passenger Power Mirror. Perform BODY VERIFICATION TEST - VER 1.	All
10	Disconnect the Passenger Door Module C2 connector. Disconnect the Passenger Power Mirror connector. Measure the resistance between the Mirror Sensor Ground circuit and the Mirror Vertical Position Signal circuit in the PDM C2 connector. Is the resistance below 1000.0 ohms? Yes → Repair the Mirror Sensor Ground wire for a short to the Mirror Vertical Position Signal wire. Perform BODY VERIFICATION TEST - VER 1. No → Go To 11	All

*PASSENGER MEMORY MIRROR INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
11	Disconnect the Passenger Door Module C2 connector. Disconnect the Passenger Power Mirror connector. Measure the resistance between the Mirror Sensor Ground circuit and the Mirror Horizontal Position Signal circuit in the PDM C2 connector. Is the resistance below 1000.0 ohms? Yes → Repair the Mirror Sensor Ground wire for a short to the Mirror Horizontal Position Signal wire. Perform BODY VERIFICATION TEST - VER 1. No → Go To 12	All
12	Disconnect the Passenger Door Module C2 connector. Disconnect the passenger Power Mirror connector. Measure the resistance between ground and the Mirror Horizontal Position Signal circuit. Is the resistance below 1000.0 ohms? Yes → Repair the Mirror Horizontal Position Signal wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 13	All
13	Disconnect the Passenger Door Module C2 connector. Disconnect the Passenger Power Mirror connector. Measure the resistance between ground and the Mirror Vertical Position Signal circuit. Is the resistance below 1000.0 ohms? Yes → Repair the Mirror Vertical Position Signal wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 14	All
14	Disconnect the Passenger Door Module C2 connector. Disconnect the Passenger Power Mirror connector. Measure the resistance of the Mirror Horizontal Position Signal circuit between the PDM "C2" connector and the Passenger Power Mirror connector. Is the resistance below 5.0 ohms? Yes → Go To 15 No → Repair the open Mirror Horizontal Position Signal wire. Perform BODY VERIFICATION TEST - VER 1.	All
15	Disconnect the Passenger Door Module C2 connector. Disconnect the Passenger Power Mirror connector. Measure the resistance of the Mirror Vertical Position Signal circuit between the PDM C2 connector and the Passenger Power Mirror connector. Is the resistance below 5.0 ohms? Yes → Go To 16 No → Repair the open Mirror Vertical Position Signal wire. Perform BODY VERIFICATION TEST - VER 1.	All
16	If there are no possible causes remaining, view repair. Repair Replace the Passenger Door Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
ACCESSORY (SUNROOF) DELAY RELAY SHORTED HI

When Monitored and Set Condition:

ACCESSORY (SUNROOF) DELAY RELAY SHORTED HI

When Monitored: Igniton in ″RUN″ and IOD fuse/connector installed.

Set Condition: The BCM is trying to activate the sunroof (accy) delay relay. The fault is set when the BCM tries to pull this input low and excessive current is sinked into the BCM.

POSSIBLE CAUSES
SUNROOF DELAY RELAY COIL
SUNROOF DELAY RELAY CONTROL CIRCUIT SHORT TO BATTERY
SUNROOF SECTION OF BCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Lower the Junction Block and remove the Sunroof Delay Relay. Measure the resistance of the relay coil across terminals 1 and 2 or (85 and 86) of the relay. What resistance did you measure? Below 65.0 ohms Replace the Sunroof Delay Relay. Perform BODY VERIFICATION TEST - VER 1. Between 65 and 90 ohms Go To 2	All
2	Turn the ignition off. Lower the Junction Block and remove the Sunroof Delay Relay. Remove the Body Control Module from the Junction Block. Turn ignition on. Measure the voltage of the Sunroof Delay Relay Control circuit at the Junction Block BCM connector. Is there any voltage present? Yes → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	If there are no possible causes remaining, view Repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*SUNROOF DELAY INOPERATIVE

POSSIBLE CAUSES
SUNROOF SECTION OF BCM
REFER TO MOTOR INOP

TEST	ACTION	APPLICABILITY
1	The sunroof will be operational for approximately 45 seconds after the ignition has been turned off. If either front door is opened, power to the sunroof will be immediately removed. Ensure that both front doors are closed. Turn ignition on. Open and close the sunroof. What happened while opening and closing the sunroof? Opened and closed normally Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. Failed to open Refer to symptom list for problems related to SUNROOF MOTOR INOPERATIVE. Failed to close Refer to symptom list for problems related to SUNROOF MOTOR INOPERATIVE.	All

Symptom:
*SUNROOF MOTOR INOPERATIVE

POSSIBLE CAUSES
CHECK DTC
OPEN RELAY CONTACT
SUNROOF DELAY RELAY COIL
SUNROOF SWITCH GROUND CIRCUIT OPEN
BLOWN FUSE #25
FUSE #25 DEFECTIVE
JUNCTION BLOCK DEFECTIVE
SUNROOF DELAY RELAY CONTROL J/B OPEN
SUNROOF OPEN SWITCH OPEN
SUNROOF DELAY RELAY OUTPUT SHORTED TO GROUND
SUNROOF VENT SWITCH OPEN
SUNROOF MOTOR B+ WIRE SHORT TO GROUND
SUNROOF MOTOR B- WIRE SHORT TO GROUND
SUNROOF GROUND CIRCUIT OPEN
SUNROOF MOTOR SHORT TO GROUND
″OPEN″ POWER SUNROOF OPEN CIRCUIT
OPEN POWER SUNROOF VENT CIRCUIT
OPEN SUNROOF DELAY RELAY OUTPUT CIRCUIT
BODY CONTROL MODULE - OPEN RELAY CONTROL
SUNROOF ASSEMBLY MODULE OR MOTOR OPEN
SUNROOF CONTROL MODULE - SHORT TO GROUND
SUNROOF CONTROL MODULE OPEN

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, read Body Computer DTC's. Does the DRBIII® display ″Accessory Delay Relay Shorted Hi″ Yes → Refer to symptom list for problems related to ACCESSORY DELAY RELAY SHORTED HI. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All

*SUNROOF MOTOR INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
2	Turn the ignition off. Lower the Junction Block and remove the Sunroof Delay Relay. Measure the resistance of the relay coil across terminals 1 & 2 or 85 & 86. What resistance did you measure? Below 65.0 ohms Replace the Sunroof Delay Relay. Perform BODY VERIFICATION TEST - VER 1. Between 65 and 85 ohms Go To 3 Greater than 85 ohms Replace the Sunroof Delay Relay. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn ignition off. Lower the Junction Block and remove the Sunroof Delay Relay. Measure the voltage of the Fused B(+) circuit in the Sunroof (accessory) Delay Relay cavity #30 and cavity #85 to ground. Is the voltage above 10.5 volts in both cavities? Yes → Go To 4 No → Go To 16	All
4	Lower the Junction Block and remove the Sunroof Delay Relay. Connect a test light between the Fused B(+) ckt and the Sunroof Delay Relay Control ckt (cavities 85 & 86) in the relay connector. Turn the ignition to the ″Run″ position and observe the test light.. Does the test light illuminate when ignition is in the ″On″ position? Yes → Go To 5 No → Go To 14	All
5	Turn the ignition off. Remove the Sunroof Delay Relay Connect a jumper wire between the Fused B(+) ckt and the Sunroof Delay Relay Output ckt (cavities 30 & 87) in the relay connector. Turn the ignition on and operate the sunroof. Did the sunroof motor operate? Yes → Replace the Sunroof Delay Relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	Turn the ignition off. Turn all lights off. Gain access to the sunroof switch and disconnect the connector. Measure the resistance of the ground circuit at the sunroof switch connector. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the sunroof switch ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

*SUNROOF MOTOR INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off. Gain access to the sunroof switch and disconnect the connector. Connect an ohmmeter between the power sunroof open circuit and the ground circuit on the sunroof switch. When pressing the ″open″ button on the sunroof switch does the meter read less than 5.0 ohms? Yes → Go To 8 No → Replace the Sunroof Switch. Perform BODY VERIFICATION TEST - VER 1.	All
8	Turn the ignition off. Gain access to the sunroof switch and disconnect the connector. Connect an ohmmeter between the power sunroof vent/close circuit and the ground circuit on the sunroof switch. When pressing the ″vent/close″ button on the sunroof switch does the meter read less than 5.0 ohms? Yes → Go To 9 No → Replace the Sunroof Switch. Perform BODY VERIFICATION TEST - VER 1.	All
9	Turn the ignition off. Turn all lights off. Gain access to the power sunroof assembly and disconnect the Sunroof Control Module connector (necessary to lower the overhead console, remove the ″A″ pillar trim, sunvisors, assist handles and sunroof pinch welt). Measure the resistance of the ground circuit in the Sunroof Control Module connector. Is the resistance below 5.0 ohms? Yes → Go To 10 No → Repair the power sunroof assembly open ground circuit. Perform BODY VERIFICATION TEST - VER 1.	All
10	Turn the ignition off. Gain access to the power sunroof assembly and disconnect the Sunroof Control Module connector (necessary to lower the overhead console, remove the ″A″ pillar trim, sunvisors, assist handles and sunroof pinch welt). Gain access to the sunroof switch and disconnect the connector. Measure the resistance of the Power Sunroof Open circuit between the Sunroof Control Module and the Sunroof Switch. Is the resistance below 5.0 ohms? Yes → Go To 11 No → Repair the Power Sunroof Open circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

*SUNROOF MOTOR INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
11	Turn the ignition off. Gain access to the power sunroof assembly and disconnect the Sunroof Control Module connector (necessary to lower the overhead console, remove the ″A″ pillar trim, sunvisors, assist handles and sunroof pinch welt). Gain access to the Sunroof Switch and disconnect the connector. Measure the resistance of the Power Sunroof Vent circuit between the Sunroof Control Module and the Sunroof Switch. Is the resistance below 5.0 ohms? Yes → Go To 12 No → Repair the Power Sunroof Vent circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
12	Turn the ignition off. Lower the Junction Block and remove the Sunroof Delay Relay. Gain access to the power sunroof assembly and disconnect the Sunroof Control Module connector (necessary to lower the overhead console, remove the ″A″ pillar trim, sunvisors, assist handles and sunroof pinch welt). Measure the resistance of the sunroof delay relay output circuit between the power sunroof control module connector and the sunroof delay relay cavity 87. Is the resistance below 5.0 ohms? Yes → Go To 13 No → Repair the Sunroof Delay Relay Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
13	Remove the headliner as per instructions in ″Service Information″. Disconnect the Sunroof Control Module connector. Momentarily apply Fused 12 volts to the Sunroof Motor B+ circuit and ground the Sunroof Motor B- circuit in the Module connector (the motor should run). Reverse the polarity by switching the power and ground (the motor should run in the opposite direction). Did the glass move in both directions? Yes → Run the motor until the Sunroof is fully closed and replace the Sunroof Control Module Perform BODY VERIFICATION TEST - VER 1. No → Replace the Sunroof Motor. Perform BODY VERIFICATION TEST - VER 1.	All
14	Turn ignition off. Remove the Body Control Module. Lower the Junction Block and remove the Sunroof Delay Relay. Measure the resistance of the Sunroof Delay Relay Control circuit between the Junction Block BCM connector and the Sunroof Delay Relay cavity #86. Is the resistance below 5.0 ohms? Yes → Go To 15 No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1.	All
15	If there are no possible causes remaining, view Repair. Repair Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

*SUNROOF MOTOR INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
16	Turn ignition off. Remove and inspect the Junction Block Fuse #25. Is the fuse open? No → Replace the Junction Block. Perform BODY VERIFICATION TEST - VER 1. Yes → Go To 17	All
17	Replace the juction block fuse #25 with a known good fuse. Turn ignition on and operate the sunroof. Turn the ignition off. Remove and inspect the Junction Block Fuse #25. Is the fuse blown? Yes → Go To 18 No → Replacing the open fuse has corrected the problem. Test complete. Perform BODY VERIFICATION TEST - VER 1.	All
18	Turn ignition off. Remove the Sunroof (accessory) Delay Relay. Remove the Junction Block Fuse #25. Measure the resistance of the Sunroof (accessory) Delay Relay cavity #30 in the Junction Block to ground. Is the resistance below 5.0 ohms? Yes → Replace the defective Junction Block. Perform BODY VERIFICATION TEST - VER 1. No → Go To 19	All
19	Turn the ignition off. Lower the Junction Block and remove the Sunroof Delay Relay. Gain access to the power sunroof assembly and disconnect the Sunroof Control Module connector (necessary to lower the overhead console, remove the ″A″ pillar trim, sun visors, assist handles and sunroof pinch welt). Measure the resistance of the sunroof delay relay output circuit at the Sunroof Control Module connector to ground. Is the resistance below 1000 ohms? Yes → Repair the Sunroof Delay Relay Output circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 20	All
20	Remove the headliner as per instructions in ″Service Information″. Disconnect the sunroof motor 2-way connector. Disconnect the Sunroof Control Module connector Measure the resistance between ground and the Sunroof Motor B+ circuit. Is the resistance below 1000.0 ohms? Yes → Repair the Sunroof Motor B+ wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 21	All

*SUNROOF MOTOR INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
21	Remove the headliner as per instructions in "Service Information". Disconnect the Sunroof Motor 2-way connector. Disconnect the Sunroof Control Module connector Measure the resistance between ground and the Sunroof Motor B- circuit. Is the resistance below 1000.0 ohms? Yes → Repair the Sunroof Motor B- wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 22	All
22	Remove the headliner as per instructions in "Service Information". Disconnect the Sunroof Control Module connector. Ensure the Sunroof Motor connector is connected before proceeding. Measure the resistance between ground and the Sunroof Motor B+ circuit. Is the resistance below 100.0 ohms Yes → Replace the Sunroof Motor. Perform BODY VERIFICATION TEST - VER 1. No → Go To 23	All
23	If there are no possible causes remaining, view repair. Repair Replace the Sunroof Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*ALL POWER WINDOWS INOPERATIVE

POSSIBLE CAUSES
MODULE RESPONSE
DRIVER DOOR MODULE - WINDOWS INOPERATIVE

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, read the DOOR MODULE status. Is the DRBIII able to access Both Door Modules? No → Refer to the COMMUNICATION category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1. Yes → Replace the Driver Door Module.. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*DRIVER REAR WINDOW INOPERATIVE FROM BOTH SWITCHES

POSSIBLE CAUSES
REAR WINDOW SWITCH OPEN
DRIVER REAR WINDOW DRIVER DOWN WIRE OPEN
DRIVER REAR WINDOW DRIVER UP WIRE OPEN
DRIVER REAR WINDOW DRIVER UP WIRE SHORT TO GROUND
DRIVER REAR WINDOW DRIVER DOWN WIRE SHORT TO GROUND
WINDOW DRIVER DOWN WIRE OPEN
WINDOW DRIVER DOWN WIRE SHORT TO GROUND
WINDOW DRIVER UP WIRE OPEN
WINDOW DRIVER UP WIRE SHORT TO GROUND
REAR WINDOW MOTOR OPEN
DRIVER DOOR MODULE - OUTPUT OPEN

TEST	ACTION	APPLICABILITY
1	Remove the Rear Door Trim Panel. Disconnect the rear window switch connector. Turn the ignition on. Using a 12-volt Test Light connected to ground, check the Driver Rear Window Driver Up and Down circuits. Did the test light illuminate brightly on both circuits? Yes → Go To 2 No → Go To 8	All
2	Remove the Rear Door Trim Panel. Disconnect the Driver Rear Power Window Switch connector. Turn the ignition on. **Warning: Keep the window area clear as the window SHOULD move up and down in this test.** Connect a jumper wire from the Window Driver Down terminal in the switch connector to ground. Connect a jumper wire from the Window Driver Up terminal in the switch connector and momentarily connect it to the Rear Window Driver Up terminal in the switch connector. Reverse the Jumper wires to run the motor in the opposite direction. Did the Window Motor operate in both directions? Yes → Replace the Rear Window Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

*DRIVER REAR WINDOW INOPERATIVE FROM BOTH SWITCHES — Continued

TEST	ACTION	APPLICABILITY
3	Remove the Rear Door Trim Panel. Disconnect the Driver Rear Window Switch connector. Disconnect the Driver Rear Power Window Motor connector. Measure the resistance of the Window Driver Down circuit between the window switch connector and the window motor connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the Window Driver Down wire for an open. Perform BODY VERIFICATION TEST - VER 1.	All
4	Remove the Rear Door Trim Panel. Disconnect the Driver Rear Window Switch connector. Disconnect the Driver Rear Power Window Motor connector. Measure the resistance of the Window Driver Down circuit to ground. Is the resistance below 1000.0 ohms? Yes → Repair the Window Driver Down wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Disconnect the Driver Rear Window Switch connector. Disconnect the Driver Rear Power Window Motor connector. Measure the resistance of the Window Driver Up circuit between the window switch connector and the window motor connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the Window Driver Up wire for an open. Perform BODY VERIFICATION TEST - VER 1.	All
6	Disconnect the Driver Rear Window Switch connector. Disconnect the Driver Rear Power Window Motor connector. Measure the resistance of the Window Driver Up circuit to ground. Is the resistance below 1000.0 ohms? Yes → Repair the Window Driver Up Wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 7	All
7	If there are no possible causes remaining, view repair. Repair Replace the Rear Window Motor. Perform BODY VERIFICATION TEST - VER 1.	All
8	Disconnect the Driver Door Module ″C1″ connector. Disconnect the Driver Rear Window Switch connector. Measure the resistance of the Driver Rear Window Driver Down circuit between the DDM connector and the Window Switch connector. Is the resistance below 5.0 ohms? Yes → Go To 9 No → Repair the Driver Rear Window Driver Down wire for an open.. Perform BODY VERIFICATION TEST - VER 1.	All

*DRIVER REAR WINDOW INOPERATIVE FROM BOTH SWITCHES — Continued

TEST	ACTION	APPLICABILITY
9	Disconnect the Driver Door Module ″C1″ connector. Disconnect the Driver Rear Widow Switch connector. Measure the resistance of the Driver Rear Window Driver Up circuit between the DDM connector and the Window Switch connector. Is the resistance below 5.0 ohms? Yes → Go To 10 No → Repair the Driver Rear Window Driver Up wire for an open. Perform BODY VERIFICATION TEST - VER 1.	All
10	Disconnect the Driver Door Module ″C1″ connector. Disconnect the Driver Rear Window Switch connector. Measure the resistance of the Driver Rear Window Driver Up circuit to ground.. Is the resistance below 1000.0 ohms? Yes → Repair the Driver Rear Window Driver Up wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 11	All
11	Disconnect the Driver Door Module ″C1″ connector. Disconnect the Driver Rear Window Switch connector. Measure the resistance of the Driver Rear Window Driver Down circuit to ground.. Is the resistance below 1000.0 ohms? Yes → Repair the Driver Rear Window Driver Down wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 12	All
12	If there are no possible causes remaining, view repair. Repair Replace the Driver Door Module (output open) Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*DRIVER REAR WINDOW INOPERATIVE FROM DDM

POSSIBLE CAUSES
DRIVER DOOR MODULE - DRIVER REAR WINDOW INOPERATIVE

TEST	ACTION	APPLICABILITY
1	This test assumes that the driver rear window IS operational from the driver rear door switch. Ensure the driver rear window is operational from the driver rear door switch. If is not, refer to symptom list for problems related to DRIVER REAR WINDOW INOPERATIVE FROM BOTH SWITCHES. SWITCHES. If there are no possible causes remaining, view repair. Repair Replace the Driver Door Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*DRIVER REAR WINDOW INOPERATIVE FROM REAR SWITCH

POSSIBLE CAUSES
OPEN GROUND CIRCUIT
SWITCH DEFECTIVE

TEST	ACTION	APPLICABILITY
1	**Note Ensure the Window Lock out Switch on the DDM is operating properly before proceeding.** Remove the Rear Door Trim Panel. Disconnect the Power Window Switch connector. Measure the resistance of the Ground circuit to ground. Is the resistance below 5.0 ohms? Yes → Replace the Power Window Switch. Perform BODY VERIFICATION TEST - VER 1. No → Repair the open ground circuit. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*DRIVER WINDOW INOPERATIVE

POSSIBLE CAUSES
DRIVER DOOR MODULE - OPEN SWITCH
DRIVER DOOR MODULE - OUTPUT OPEN
MOTOR CIRCUIT CHECK
DRIVER WINDOW DRIVER UP WIRE OPEN
DRIVER WINDOW DRIVER UP SHORTED TO GROUND
DRIVER WINDOW DRIVER DOWN WIRE OPEN
DRIVER WINDOW DRIVER UP SHORTED TO VOLTAGE
DRIVER WINDOW DRIVER DOWN SHORTED TO GROUND
DRIVER WINDOW DRIVER DOWN SHORTED TO VOLTAGE
MOTOR DEFECTIVE OPEN
MOTOR DEFECTIVE SHORT TO GROUND

TEST	ACTION	APPLICABILITY
1	Connect the DRBIII and select: ″Body″, ″Door Modules″, ″Actuators″ With the DRBIII actuate the ″DRV F WIN UP RLY″ and then the ″DRV F WIN DN RLY″.. Did the window operate up and down? Yes → Replace the Driver Door Module (switch input open) Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Driver Door Module ″C1″ connector. **Warning: Keep the window area clear as the window SHOULD move up and down in this test.** Connect a jumper wire from the Driver Window Driver Down terminal to the ground terminal. Connect a jumper wire from the Driver Window Driver Up terminal and momentarily connect it to the Fused B(+) terminal. Reverse the Jumper wires to run the motor in the opposite direction. Did the window motor operate up and down? Yes → Replace the Driver Door Module (output open). Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

*DRIVER WINDOW INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
3	Disconnect the Driver Door Module ″C1″ connector. Turn ignition off. Measure and record the total resistance of the motor ckt between the Driver Window Driver Up ckt and the Driver Window Driver Down ckt in the DDM ″C1″ connector (should be under 5.0 ohms). Measure and record the resistance of the Driver Window Driver Down ckt to ground in the DDM ″C1″ connector (should be infinite). Turn ignition on. Measure and record the voltage of the Driver Window Driver Down ckt to ground in the DDM ″C1″ connector (should be zero). What were your readings Total resistance above 5.0 ohms Go To 4 Resistance to gnd less than 1000 ohms Go To 7 Voltage above 0.02 volts Go To 10 None of the above Check and repair any reasons for the window regulator to bind. If the mechanism is OK, replace the power window motor. Perform BODY VERIFICATION TEST - VER 1.	All
4	Disconnect the driver door module ″C1″ connector. Disconnect the driver power window motor connector. Measure the resistance of the Driver Window Driver Up circuit between the DDM connector and the window motor connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Driver Window Driver up wire for an open. Perform BODY VERIFICATION TEST - VER 1.	All
5	Disconnect the driver door module ″C1″ connector. Disconnect the driver power window motor connector. Measure the resistance of the Driver Window Driver Down circuit between the DDM connector and the window motor connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the Driver Window Driver down wire for an open. Perform BODY VERIFICATION TEST - VER 1.	All
6	If there are no possible causes remaining, view Repair. Repair Replace the power window motor. Perform BODY VERIFICATION TEST - VER 1.	All

*DRIVER WINDOW INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
7	Disconnect the driver door module ″C1″ connector. Disconnect the driver power window motor connector. Measure the resistance of the Driver Window Driver Up circuit to ground. Is the resistance below 100.0 ohms? Yes → Repair the Driver Window Driver up wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 8	All
8	Disconnect the driver door module ″C1″ connector. Disconnect the driver power window motor connector. Measure the resistance of the Driver Window Driver Down ckt to ground. Is the resistance below 100.0 ohms? Yes → Repair the Driver Window Driver Down wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 9	All
9	If there are no possible causes remaining, view Repair. Repair Replace the Power Window Motor (internal short) Perform BODY VERIFICATION TEST - VER 1.	All
10	Disconnect the driver door module ″C1″ connector. Disconnect the driver power window motor connector. Measure the voltage of the Driver Window Driver Up ckt to ground. Is there ANY voltage on the Driver Window Driver Up wire? Yes → Repair the Driver Window Driver Up wire for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Go To 11	All
11	Disconnect the driver door module ″C1″ connector. Disconnect the driver power window motor connector. Measure the voltage of the Driver Window Driver Down ckt to ground. Is there ANY voltage on the Driver Window Driver Down wire? Yes → Repair the Driver Window Driver Down wire for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
*PASSENGER REAR WINDOW INOPERATIVE FROM BOTH SWITCHES

POSSIBLE CAUSES
REAR WINDOW SWITCH OPEN
PASSENGER REAR WINDOW DRIVER DOWN WIRE OPEN
PASSENGER REAR WINDOW DRIVER UP WIRE OPEN
PASSENGER REAR WINDOW DRIVER UP WIRE SHORT TO GROUND
PASSENGER REAR WINDOW DRIVER DOWN WIRE SHORT TO GROUND
WINDOW DRIVER DOWN WIRE OPEN
WINDOW DRIVER DOWN WIRE SHORT TO GROUND
WINDOW DRIVER UP WIRE OPEN
WINDOW DRIVER UP WIRE SHORT TO GROUND
REAR WINDOW MOTOR OPEN
PASSENGER DOOR MODULE - OUTPUT OPEN

TEST	ACTION	APPLICABILITY
1	Remove the Rear Door Trim Panel. Disconnect the rear window switch connector. Turn the ignition on. Using a 12-volt Test Light connected to ground, check the Passenger Rear Window Driver Up and Down circuits. Did the test light illuminate brightly on both circuits? Yes → Go To 2 No → Go To 8	All
2	Remove the Rear Door Trim Panel. Disconnect the Passenger Rear Power Window Switch connector. Turn the ignition on. **Warning: Keep the window area clear as the window SHOULD move up and down in this test.** Connect a jumper wire from the Window Driver Down terminal in the switch connector to ground. Connect a jumper wire from the Window Driver Up terminal in the switch connector and momentarily connect it to the Rear Window Driver Up terminal in the switch connector. Reverse the Jumper wires to run the motor in the opposite direction. Did the Window Motor operate in both directions? Yes → Replace the Rear Window Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

*PASSENGER REAR WINDOW INOPERATIVE FROM BOTH SWITCHES — Continued

Measure the resistance of the Passenger Rear Window Driver Up circuit between the PDM connector and the Window Switch connector. Is the resistance below 5.0 ohms? Yes → Go To 10 No → Repair the Passenger Rear Window Driver Up wire for an open. Perform BODY VERIFICATION TEST - VER 1.	All
10	Disconnect the Passenger Door Module ″C1″ connector. Disconnect the Passenger Rear Window Switch connector. Measure the resistance of the Passenger Rear Window Driver Up circuit to ground.. Is the resistance below 1000.0 ohms? Yes → Repair the Passenger Rear Window Driver Up wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 11	All
11	Disconnect the Passenger Door Module ″C1″ connector. Disconnect the Passenger Rear Window Switch connector. Measure the resistance of the Passenger Rear Window Driver Down circuit to ground.. Is the resistance below 1000.0 ohms? Yes → Repair the Passenger Rear Window Driver Down wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 12	All
12	If there are no possible causes remaining, view repair. Repair Replace the Passenger Door Module (output open) Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*PASSENGER REAR WINDOW INOPERATIVE FROM DDM

POSSIBLE CAUSES
DRIVER DOOR MODULE - PASSENGER REAR WINDOW INOPERATIVE

TEST	ACTION	APPLICABILITY
1	This test assumes that the passenger rear window IS operational from the passenger window switches. If it is not, Refer to symptom list for problems related to Passenger Rear Window Inoperative from Both Switches. If there are no possible causes remaining, view Repair. Repair Replace the Driver Door Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*PASSENGER REAR WINDOW INOPERATIVE FROM REAR SWITCH

POSSIBLE CAUSES
OPEN GROUND CIRCUIT
SWITCH DEFECTIVE

TEST	ACTION	APPLICABILITY
1	**Note Ensure the Window Lock out Switch on the DDM is operating properly before proceeding.** Remove the Rear Door Trim Panel. Disconnect the Power Window Switch connector. Turn the ignition off. Turn all lights off. Measure the resistance of the Ground circuit to ground. Is the resistance below 5.0 ohms? Yes → Replace the Power Window Switch. Perform BODY VERIFICATION TEST - VER 1. No → Repair the open ground circuit. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*PASSENGER WINDOW INOPERATIVE FROM BOTH SWITCHES

POSSIBLE CAUSES
PASSENGER DOOR MODULE - OPEN SWITCH
PASSENGER DOOR MODULE - OUTPUT OPEN
PASSENGER MOTOR CIRCUIT CHECK
PASSENGER WINDOW DRIVER DOWN WIRE OPEN
PASSENGER WINDOW DRIVER UP WIRE OPEN
PASSENGER WINDOW DRIVER DOWN SHORTED TO GROUND
PASSENGER WINDOW DRIVER UP SHORTED TO GROUND
PASSENGER WINDOW DRIVER DOWN SHORTED TO VOLTAGE
PASSENGER WINDOW DRIVER UP SHORTED TO VOLTAGE
WINDOW MOTOR OPEN
WINDOW MOTOR SHORT TO GROUND

TEST	ACTION	APPLICABILITY
1	**NOTE: Ensure there is communication with the Passenger and Driver Door Modules before proceeding.** Connect the DRBIII and select: ″Body″ ″Door Modules″ ″Actuators″ With the DRBIII actuate the ″PASS F WIN UP RLY″ and then the ″PASS F WIN DN RLY″.. Did the window operate up and down? Yes → Replace the Passenger Door Module (switch input open) Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Disconnect the Passenger Door Module ″C1″ connector. **Warning: Keep the window area clear as the window SHOULD move up and down in this test.** Connect a jumper wire from the Passenger Window Driver Down terminal to the ground terminal . Connect a jumper wire from the Passenger Window Driver Up terminal and momentarily connect it to the Fused B(+) terminal. Reverse the Jumper wires to run the motor in the oposite direction. Did the window motor operate up and down? Yes → Replace the Passenger Door Module (output open). Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

*PASSENGER WINDOW INOPERATIVE FROM BOTH SWITCHES — Continued

TEST	ACTION	APPLICABILITY
3	Disconnect the Passenger Door Module ″C1″ connector. Turn ignition off. Measure and record the total resistance of the motor circuit between the Passenger Window Driver Up circuit and the Passenger Window Driver Down circuit in the PDM ″C1″ connector (should be under 5.0 ohms). Measure and record the resistance of the Passenger Window Driver Down circuit to ground in the PDM ″C1″ connector (should be infinite). Turn ignition on. Measure and record the voltage of the Passenger Window Driver Down circuit to ground in the PDM ″C1″ connector (should be zero). What were your readings Total resistance above 5.0 ohms Go To 4 Resistance to gnd less than 1000 ohms Go To 7 Voltage above 0.02 volts Go To 10 None of the above Check and repair any reasons for the window regulator to bind. If the mechanism is OK, replace the power window motor. Perform BODY VERIFICATION TEST - VER 1.	All
4	Disconnect the Passenger Door Module ″C1″ connector. Disconnect the Passenger Power Window Motor connector. Measure the resistance of the Passenger Window Driver Down circuit between the PDM connector and the window motor connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Passenger Window Driver Down wire for an open. Perform BODY VERIFICATION TEST - VER 1.	All
5	Disconnect the Passenger Door Module ″C1″ connector. Disconnect the Passenger Power Window Motor connector. Measure the resistance of the Passenger Window Driver Up circuit between the PDM connector and the window motor connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the Passenger Window Driver Up wire for an open. Perform BODY VERIFICATION TEST - VER 1.	All
6	If there are no possible causes remaining, view Repair. Repair Replace the Power Window Motor. Perform BODY VERIFICATION TEST - VER 1.	All

*PASSENGER WINDOW INOPERATIVE FROM BOTH SWITCHES — Continued

TEST	ACTION	APPLICABILITY
7	Disconnect the Passenger Door Module ″C1″ connector. Disconnect the Passenger Power Window Motor connector. Measure the resistance of the Passenger Window Driver Down circuit to ground. Is the resistance below 1000.0 ohms? Yes → Repair the Passenger Window Driver Down wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 8	All
8	Disconnect the Passenger Door Module ″C1″ connector. Disconnect the Passenger Power Window Motor connector. Measure the resistance of the Passenger Window Driver Up circuit to ground. Is the resistance below 1000.0 ohms? Yes → Repair the Passenger Window Driver Up wire for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 9	All
9	If there are no possible causes remaining, view Repair. Repair Replace the Power Window Motor (internal short) Perform BODY VERIFICATION TEST - VER 1.	All
10	Disconnect the Passenger Door Module ″C1″ connector. Disconnect the Passenger Power Window Motor connector. Measure the voltage of the Passenger Window Driver Down circuit to ground. Is there ANY voltage on the Passenger Window Driver Down wire? Yes → Repair the Passenger Window Driver Down wire for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Go To 11	All
11	Disconnect the Passenger Door Module ″C1″ connector. Disconnect the Passenger Power Window Motor connector. Measure the voltage of the Passenger Window Driver Up circuit to ground. Is there ANY voltage on the Passenger Window Driver Up wire? Yes → Repair the Passenger Window Driver Up wire for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
*PASSENGER WINDOW INOPERATIVE FROM DDM

POSSIBLE CAUSES
DRIVER DOOR MODULE - PASSENGER WINDOW INOPERABLE

TEST	ACTION	APPLICABILITY
1	This test assumes that the passenger window IS operational from the passenger door module. If it is not, refer to the symptom Passenger Window Inoperative from Both Switches in the Power Window category. If there are no possible causes remaining, view Repair. Repair Replace the Driver Door Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*PASSENGER WINDOW INOPERATIVE FROM PDM

POSSIBLE CAUSES
PASSENGER DOOR MODULE - SWITCH FAILURE

TEST	ACTION	APPLICABILITY
1	**Note Ensure the Window Lock out Switch on the DDM is operating properly before proceeding.** This test assumes that the passenger window IS operational from the Driver Door Module. If it is not, refer to symptom Passenger Window Inoperative from Both Switches in the Power Window category. If there are no possible causes remaining, view Repair. Repair Replace the Passenger Door Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom List:

LF SENSOR BATTERY LOW
LF TIRE PRESSURE SENSOR FAILURE
LR SENSOR BATTERY LOW
LR TIRE PRESSURE SENSOR FAILURE
RF SENSOR BATTERY LOW
RF TIRE PRESSURE SENSOR FAILURE
RR SENSOR BATTERY LOW
RR TIRE PRESSURE SENSOR FAILURE
SPARE TIRE PRESSURE SENSOR FAILURE
SPARE TIRE SENSOR BATTERY LOW

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be LF SENSOR BATTERY LOW.

When Monitored and Set Condition:

LF SENSOR BATTERY LOW

When Monitored: Key ON.

Set Condition: When the EVIC detects a low battery condition from the LF Sensor/ Transmitter.

LF TIRE PRESSURE SENSOR FAILURE

When Monitored: Key ON.

Set Condition: When the EVIC detects a no-transmit condition from the LF Sensor/ Transmitter.

LR SENSOR BATTERY LOW

When Monitored: Key ON.

Set Condition: When the EVIC detects a low battery condition from the LR Sensor/ Transmitter.

LR TIRE PRESSURE SENSOR FAILURE

When Monitored: Key ON.

Set Condition: When the EVIC detects a no-transmit condition from the LR Sensor/ Transmitter.

RF SENSOR BATTERY LOW

When Monitored: Key ON.

Set Condition: When the EVIC detects a low battery condition from the RF Sensor/ Transmitter.

LF SENSOR BATTERY LOW — Continued

RF TIRE PRESSURE SENSOR FAILURE

When Monitored: Key ON.

Set Condition: When the EVIC detects a no-transmit condition from the RF Sensor/Transmitter.

RR SENSOR BATTERY LOW

When Monitored: Key ON.

Set Condition: When the EVIC detects a low battery condition from the RR Sensor/Transmitter.

RR TIRE PRESSURE SENSOR FAILURE

When Monitored: Key ON.

Set Condition: When the EVIC detects a no-transmit condition from the RR Sensor/Transmitter.

SPARE TIRE PRESSURE SENSOR FAILURE

When Monitored: Key ON.

Set Condition: When the EVIC detects a no-transmit condition from the Spare Tire Sensor/Transmitter.

SPARE TIRE SENSOR BATTERY LOW

When Monitored: Key ON.

Set Condition: When the EVIC detects a low battery condition from the Spare Tire Sensor/Transmitter.

POSSIBLE CAUSES
EVIC INTERNAL FAULT
SENSOR/TRANSMITTER INTERNAL FAULT

TEST	ACTION	APPLICABILITY
1	Using the procedure in the System Description, retrain the EVIC With the DRBIII®, record and erase DTC's. Drive the vehicle for 10 minutes at 32 km/h (20 mph). With the DRBIII®, read DTCs. Does the DRBIII® display a Sensor Failure or Sensor Low Battery message? Yes → Replace the indicated Tire Pressure Sensor/Transmitter. Perform TIRE PRESSURE VERIFICATION TEST. No → Go To 2	All

LF SENSOR BATTERY LOW — Continued

TEST	ACTION	APPLICABILITY
2	Turn the ignition on. Observe the EVIC display. Does the EVIC display SERVICE TIRE PRESS. SYSTEM? Yes → Replace the EVIC in accordance with the Service Information. Perform TIRE PRESSURE VERIFICATION TEST. No → Test Complete.	All

Symptom List:
BCM MESSAGE NOT RECEIVED (EXPORT ONLY)
PRE-ARM TIMEOUT FAILURE (EXPORT ONLY)

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be BCM MESSAGE NOT RECEIVED.

When Monitored and Set Condition:

BCM MESSAGE NOT RECEIVED

When Monitored: Whenever the ITM sends bus messages to the BCM.

Set Condition: If the ITM does not receive status messages from the BCM.

PRE-ARM TIMEOUT FAILURE

When Monitored: During the VTSS pre-arm process.

Set Condition: If the ITM does not receive arm message from the BCM after sixty seconds.

POSSIBLE CAUSES
INTERMITTENT CONDITION
ITM COMMUNICATION WITH THE BCM
INTRUSION TRANSCEIVER MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, enter Body Computer. Was the DRB able to I/D or communicate with the Body Computer? Yes → Go To 2 No → Refer to the Communication category for the related symptom(s). Perform BODY VERIFICATION TEST - VER 1.	All

BCM MESSAGE NOT RECEIVED (EXPORT ONLY) — Continued

TEST	ACTION	APPLICABILITY
2	With the DRB, erase ITM DTC's. Turn the ignition off. Arm the VTSS and wait 1 minute. Disarm the VTSS and turn the ignition on. With the DRB, read Intrusion Transceiver Module DTC's. Did this DTC reset? Yes → Replace the Intrusion Transceiver Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → The condition that caused this symptom is currently not present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced or partially broken wires. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
HORN RELAY CIRCUIT SHORTED HI

POSSIBLE CAUSES
HORN RELAY - INTERNAL SHORT TO VOLTAGE
HORN RELAY CONTROL CIRCUIT SHORT TO VOLTAGE
BCM - HORN RELAY CONTROL SHORT TO VOLTAGE

TEST	ACTION	APPLICABILITY
1	Substitute the Horn Relay with a good relay. With the DRBIII®, record and erase DTC's. Press the horn pad several times. With the DRBIII®, read DTCs. Did the Horn Relay Ckt Shorted Hi trouble code reset? Yes → Go To 2 No → Replace the original Horn Relay. Perform VTSS VERIFICATION TEST - 1A.	All
2	Turn the ignition off. Remove the Horn Relay from the Power Distribution Center. Remove the Body Control Module from the Junction Block. Turn the ignition on. Measure the voltage between the Horn Relay Control circuit and ground. Is the voltage above 1.0 volt? Yes → Repair the Horn Relay Control circuit for a short to voltage. Perform VTSS VERIFICATION TEST - 1A. No → Replace the Body Control Module. Perform VTSS VERIFICATION TEST - 1A.	All

Symptom List:
ITM - EEPROM FAILURE (EXPORT ONLY)
LOOPBACK FAILURE (EXPORT ONLY)

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be ITM - EEPROM FAILURE.

When Monitored and Set Condition:

ITM - EEPROM FAILURE

When Monitored: Continuously while the VTSS is armed and during change of the VTSS state.

Set Condition: If the EEPROM erase/write does not correctly complete the operation.

LOOPBACK FAILURE

When Monitored: Continuously while the VTSS is armed, pre-armed or reset.

Set Condition: If an internal ITM bus test performed fails.

POSSIBLE CAUSES
INTERMITTENT CONDITION
INTRUSION TRANSCEIVER MODULE

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase the current Intrusion Transceiver Module DTC's. Turn the ignition off. Arm the VTSS and wait 1 minute. Disarm the VTSS and turn the ignition on. With the DRBIII®, read Intrusion Transceiver Module DTC's. Does the DRBIII® display the same DTC? Yes → Replace the Intrusion Transceiver Module. Perform BODY VERIFICATION TEST - VER 1. No → The condition that caused this symptom is currently not present. Test complete. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
ITM - TRANSDUCER FAILURE (EXPORT ONLY)

When Monitored and Set Condition:

ITM - TRANSDUCER FAILURE

When Monitored: Continuously during VTSS pre-arm mode.

Set Condition: The ITM sends a test ultrasonic signal during the pre-arm process. If the test signal is not correctly received, the code will be set.

POSSIBLE CAUSES
BLOCKED INTRUSION TRANSCEIVER MODULE SENSORS
INTERMITTENT CONDITION
INTRUSION TRANSCEIVER MODULE

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase the current Intrusion Transceiver Module DTC's. Turn the ignition off. Arm the VTSS and wait 1 minute. Disarm the VTSS and turn the ignition on. With the DRBIII®, read Intrusion Transceiver Module DTC's. Does the DRBIII® display: ITM Transducer Failure? Yes → Go To 2 No → The condition that caused this symptom is currently not present. Test complete. Perform BODY VERIFICATION TEST - VER 1.	All
2	Inspect the louvers of the Intrusion Transceiver Module for blockage from dust or debris. Were there any problems found? Yes → Clean as necessary. Perform VTSS VERIFICATION TEST - 1A. No → Replace the Intrusion Transceiver Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
ITM - VIN MISMATCH (EXPORT ONLY)

When Monitored and Set Condition:

ITM - VIN MISMATCH

When Monitored: While the ITM is being disarmed.

Set Condition: If the ITM stored VIN does not match with the BCM.

POSSIBLE CAUSES
INTRUSION TRANSCEIVER MODULE
BODY CONTROL MODULE
CHECK VIN IN BCM AND ITM WITH VIN IN PCM

TEST	ACTION	APPLICABILITY
1	**NOTE: Do not attempt to use either an ITM and/or a Siren from another vehicle.** With the DRBIII® display and record the VIN in the Intrusion Transceiver Module. With the DRBIII® select Body Computer. Display and record the VIN in the BCM. With the DRBIII® select Engine. Display and record the VIN in the PCM. Does the VIN in the ITM and the VIN in the BCM match the VIN in the PCM? Yes → Go To 2 No → Replace the Module(s) with the incorrect VIN. Perform BODY VERIFICATION TEST - VER 1.	All
2	With the DRBIII®, erase the current Intrusion Transceiver Module DTC's. Turn the ignition off. Arm the VTSS and wait 1 minute. Disarm the VTSS using the RKE and turn the ignition on. With the DRBIII®, read Intrusion Transceiver Module DTC's. Does the DRBIII® display: ITM VIN Mismatch? Yes → Replace the Intrusion Transceiver Module. Perform BODY VERIFICATION TEST - VER 1. No → The condition that caused this symptom is currently not present. Test complete. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom List:
NO SERIAL COMMUNICATION (EXPORT ONLY)
SIREN COMMUNICATION FAILURE (EXPORT ONLY)

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be NO SERIAL COMMUNICATION.

When Monitored and Set Condition:

NO SERIAL COMMUNICATION

When Monitored: Continuously while the VTSS is armed.

Set Condition: If the Intrusion Transceiver Module does not receive messages from the Siren.

SIREN COMMUNICATION FAILURE

When Monitored: Continuously while the VTSS is armed.

Set Condition: If the Siren does not receive messages from the Intrusion Transceiver Module.

POSSIBLE CAUSES
INTERMITTENT CONDITION
OPEN FUSED B+ CIRCUIT
SIREN SIGNAL CONTROL CIRCUIT OPEN
SIREN SIGNAL CONTROL CIRCUIT SHORT TO GROUND
INTRUSION TRANSCEIVER MODULE
OPEN GROUND CIRCUIT
VTSS SIREN

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase the current Intrusion Transceiver Module DTC's. Turn the ignition off. Arm the VTSS and wait 1 minute. Disarm the VTSS and turn the ignition on. Does the DRBIII® display the same DTC? Yes → Go To 2 No → The condition that caused this symptom is currently not present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced, pinched or partially broken wires. Perform BODY VERIFICATION TEST - VER 1.	All

NO SERIAL COMMUNICATION (EXPORT ONLY) — Continued

TEST	ACTION	APPLICABILITY
2	Gain access to the VTSS Siren. Disconnect the Siren connector. Measure the voltage of the Fused B(+) circuit in the Siren connector. Is the voltage above 10.0 volts? Yes → Go To 3 No → Repair the Fused B+ circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
3	Disconnect the Siren connector. Using a 12-volt test light connected to 12-volts, check the ground circuit. Does the test light illuminate brightly? Yes → Go To 4 No → Repair the ground circuit for an open. Perform VTSS VERIFICATION TEST - 1A.	All
4	Use the DRBIII® and set up as follows: Use the Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRBIII®. Attach the red and black leads and the cable to probe adapter to the scope input cable. Select DRBIII® Standalone. Select lab scope. Select Live. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Press F2 again when complete. Disconnect the Siren connector. Connect the black lead to the chassis ground. Connect the red lead to the Siren Signal Control circuit in the Siren connector. Start the engine and hold the engine RPM's above 600. Observe the voltage displayed on the DRBIII® Lab Scope. Is there a voltage square wave present 1 to 2 seconds? Yes → Replace the VTSS Siren. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Disconnect the Siren harness connector. Disconnect the Intrusion Transceiver Module harness connector. Measure the resistance between ground and the Siren Signal Control circuit. Is the resistance above 5.0 ohms? Yes → Go To 6 No → Repair the Siren Signal Control circuit for a short to ground. Perform VTSS VERIFICATION TEST - 1A.	All

NO SERIAL COMMUNICATION (EXPORT ONLY) — Continued

TEST	ACTION	APPLICABILITY
6	Disconnect the Siren harness connector. Disconnect the Intrusion Transceiver Module harness connector. Measure the resistance of the Siren Signal Control circuit between the Intrusion Sensor and the Siren connector. Is the resistance below 5.0 ohms? Yes → Replace the Intrusion Transceiver Module. Perform BODY VERIFICATION TEST - VER 1. No → Repair the Siren Signal Control circuit for an open. Perform VTSS VERIFICATION TEST - 1A.	All

Symptom:
PCM MESSAGE NOT RECEIVED (EXPORT ONLY)

When Monitored and Set Condition:

PCM MESSAGE NOT RECEIVED

When Monitored: With the ignition on.

Set Condition: The ITM does not receive PCI bus messages from the PCM for 12 seconds.

POSSIBLE CAUSES
PCM MESSAGE NOT RECEIVED
ATTEMPT TO COMMUNICATE WITH THE PCM
PCI BUS CIRCUIT OPEN
POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB enter System Tests then PCM Monitor. Does the DRB display: PCM is active on BUS? Yes → With the DRB, erase ITM DTCs. Cycle the ignition switch, wait 1 minute then recheck for ITM DTCs. If DTC resets, replace the Intrusion Transceiver Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition on. With the DRB, attempt to communicate with the PCM. Was the DRB able to communicate with the PCM? Yes → Go To 3 No → Refer to the communication category and perform the appropriate symptom. Perform BODY VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Disconnect the PCM C3 harness connector. Connect the diagnostic junction port tester #8339 to the diagnostic junction port. **Note: Do not connect the tester to the DRB.** Measure the resistance of the PCI Bus circuit between the diagnostic junction port tester and the PCM connector. Is the resistance below 5.0 ohms? Yes → Replace the Powertrain Control Module in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. No → Repair the PCI Bus circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
SIREN BATTERY HAS BEEN TAMPERED (EXPORT ONLY)

When Monitored and Set Condition:

SIREN BATTERY HAS BEEN TAMPERED

When Monitored: Continuously while the VTSS is armed.

Set Condition: If the siren detects the loss of vehicle battery voltage.

POSSIBLE CAUSES
INTERMITTENT CONDITION
HARNESS TAMPERING
INTRUSION TRANSCEIVER MODULE

TEST	ACTION	APPLICABILITY
1	Inspect the wiring harness to the siren for any signs of tampering or damage. Were there any problems found? Yes → Repair wiring as necessary. Perform VTSS VERIFICATION TEST - 1A. No → Go To 2	All
2	With the DRBIII®, erase the current Intrusion Transceiver Module DTC's. Turn the ignition off. Arm the VTSS and wait 1 minute. Disarm the VTSS and turn the ignition on. With the DRBIII®, read Intrusion Transceiver Module DTC's. Does the DRBIII® display: Siren Battery Has Been Tampered? Yes → Replace the Siren in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. No → The condition that caused this symptom is currently not present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced or partially broken wires. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom List:
SIREN EEPROM FAILURE (EXPORT ONLY)
SIREN INTERNAL BATTERY (EXPORT ONLY)
SIREN ROM FAILURE (EXPORT ONLY)

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be SIREN EEPROM FAILURE.

When Monitored and Set Condition:

SIREN EEPROM FAILURE

When Monitored: Continuously while the VTSS is armed.

Set Condition: If the checksum of the EEPROM does not calculate to the correct value.

SIREN INTERNAL BATTERY

When Monitored: Continuously with engine rpm over 600.

Set Condition: When the internal battery within the siren does not charge as expected, the ITM sets this code.

SIREN ROM FAILURE

When Monitored: Continuously while the VTSS is armed.

Set Condition: If the checksum of the ROM does not calculate to the correct value.

POSSIBLE CAUSES
INTERMITTENT CONDITION
SIREN

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase the current Intrusion Transceiver Module DTC's. Turn the ignition off. Arm the VTSS and wait 1 minute. Disarm the VTSS and turn the ignition on. With the DRBIII®, read Intrusion Transceiver Module DTC's. Does the DRBIII® display the same DTC? Yes → Replace the Siren. Perform BODY VERIFICATION TEST - VER 1. No → The condition that caused this symptom is currently not present. Test complete. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*ALARM TRIPS ON ITS OWN

POSSIBLE CAUSES
ALARM TRIPPED BY
INTERMITTENT CONDITION

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, read the Alarm Trip By status. Were there any causes displayed? Yes → Refer to Symptom List for problems related to the component indicated by the DRBIII®. Perform VTSS VERIFICATION TEST - 1A. No → Go To 2	All
2	**NOTE: The condition that caused the alarm is not present at this time. The following list may help in indentifying the intermittent condition.** Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect related wiring harnesses. Look for chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for loose connections, broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform VTSS VERIFICATION TEST - 1A. No → Test Complete.	All

Symptom:
*DRIVERS DOOR KEY FAILS TO DISARM VTSS

POSSIBLE CAUSES
DRIVER DOOR MODULE RESET
RESET DOOR MODULE
OPEN GROUND CIRCUIT
DRIVER CYLINDER LOCK SWITCH SENSE CIRCUIT SHORTED TO GROUND
OPEN DRIVER CYLINDER LOCK SWITCH SENSE CIRCUIT
DRIVER CYLINDER LOCK SWITCH

TEST	ACTION	APPLICABILITY
1	With the DRBIII® in VTSS, Sensor Display, read the Driver Key Cylinder Sw voltage. Rotate the Key in the Door Key Cylinder from the normal position to the unlock position. Does the Driver Key Cylinder Sw voltage change from 5.0 to 1.6 volts? Yes → Go To 2 No → Go To 3	All
2	Reset the DDM by removing and reinstalling the JB POWER Fuse #12 in the Power Distribution Center. Attempt to disarm the VTSS using the Door Key. Can the VTSS now be disarmed using the Door Key? Yes → Resetting the Driver Door Module has corrected the problem. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Driver Door Module. Perform BODY VERIFICATION TEST - VER 1.	All
3	Disconnect the Driver Cylinder Lock Switch harness connector. Using a 12-volt Test Light connected to 12-volts, check the Driver Cylinder Lock Switch Ground circuit. Does the test light illuminate? Yes → Go To 4 No → Repair the Driver Cylinder Lock Switch Ground circuit for an open. Perform VTSS VERIFICATION TEST - 1A.	All
4	Disconnect the Driver Door Module C1 harness connector. Disconnect the Driver Cylinder Lock Switch harness connector. Using a 12-volt Test Light connected to 12-volts, check the Driver Cylinder Lock Switch Sense circuit. Does the test light illuminate? Yes → Repair the Driver Door Cylinder Lock Switch Sense circuit for a short to ground. Perform VTSS VERIFICATION TEST - 1A. No → Go To 5	All

*DRIVERS DOOR KEY FAILS TO DISARM VTSS — Continued

TEST	ACTION	APPLICABILITY
5	Disconnect the Driver Door Module C1 harness connector. Disconnect the Driver Cylinder Lock Switch harness connector. Measure the resistance of the Sense circuit. Is the resistance below 5.0 ohms? Yes → Replace the Driver Cylinder Lock Switch in accordance with the Service Information. Perform VTSS VERIFICATION TEST - 1A. No → Repair the Driver Cylinder Lock Switch Sense circuit for an open. Perform VTSS VERIFICATION TEST - 1A.	All

Symptom:
*HAZARD LAMPS FAIL TO FLASH WITH ALARM TRIPPED

POSSIBLE CAUSES
VERIFY HAZARD OPERATION
BCM -- HAZARDS INOPERATIVE WITH VTSS ALARM TRIPPED
JUNCTION BLOCK

TEST	ACTION	APPLICABILITY
1	Turn the Hazard Lamps on. Do the Hazard Lamps operate properly? Yes → Go To 2 No → Check and diagnose related Body Control Module Diagnostic Trouble Codes. If no DTCs are present, refer to the Service Information. Perform VTSS VERIFICATION TEST - 1A.	All
2	Remove the BCM from the Junction Block. Connect a jumper wire between cavity 10 of the Junction Block and ground. Do the hazard lamps operate? Yes → Replace the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Replace the Junction Block in accordance with the Service Information. Perform VTSS VERIFICATION TEST - 1A.	All

Symptom:

*HEADLAMPS FAIL TO FLASH WITH ALARM TRIPPED

POSSIBLE CAUSES
VERIFY LOW BEAM OPERATION
BCM -- HEADLAMPS FAIL TO FLASH WHEN VTSS IS IN ALARM

TEST	ACTION	APPLICABILITY
1	Turn the Low Beam Headlamps on. Do the Low Beam Headlamps operate properly? Yes → Replace the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Refer to the Exterior Lighting symptom list and also check for related Body Control Module Diagnostic Trouble Codes. Perform VTSS VERIFICATION TEST - 1A.	All

Symptom:

*HORN FAILS TO SOUND WITH ALARM TRIPPED

POSSIBLE CAUSES
CHECK HORN OPERATION
JUNCTION BLOCK - OPEN HORN RELAY CONTROL CIRCUIT
BODY CONTROL MODULE-OPEN HORN RELAY CONTROL CIRCUIT

TEST	ACTION	APPLICABILITY
1	Push the Horn Button on the Steering Wheel. Does the Horn operate properly? Yes → Go To 2 No → Check for and diagnose related Body Control Module Diagnostic Trouble Codes. If there are no DTCs present, refer to the Service Information to diagnose the horn system. Perform VTSS VERIFICATION TEST - 1A.	All
2	Remove the BCM from the junction block. Using a 12-volt test light connected to 12-volts, probe the Horn Relay Control circuit at the J/B side of the Junction Block-to-Body Control Module connector. While monitoring the test light, press the horn button on the steering wheel. Did the test light illuminate when the horn button was pressed? Yes → Replace the Body Contol Module. Perform VTSS VERIFICATION TEST - 1A. No → Replace the Junction Block in accordance with the Service Information. Perform VTSS VERIFICATION TEST - 1A.	All

Symptom:

*INTRUSION TRANSCEIVER MODULE SENSITIVITY (EXPORT ONLY)

POSSIBLE CAUSES
INTERIOR TYPE SELECTED IN ITM

TEST	ACTION	APPLICABILITY
1	With the DRBIII® in Miscellaneous, check the Current Status of the Interior Type. Is the Interior Type selected correct? Yes → Test Complete. No → Program the correct interior type. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
*THEFT ALARM WILL NOT ARM

POSSIBLE CAUSES
CHECK THE VTSS STATUS
CHECK FOR DTCS AND VTSS ARMING INHIBITORS
BODY CONTROL MODULE - NO ALARM OUTPUT

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, check that the Theft Alarm is enabled. Was the Theft Alarm enabled? Yes → Go To 2 No → With the DRBIII®, enable the Vehicle Theft Security System (VTSS). Perform VTSS VERIFICATION TEST - 1A.	All
2	Make sure the liftgate, liftgate flip-up, hood and all doors are closed. Remove the key from the ignition. With the DRBIII®, read the active DTC's, ajar switch states, and the key-in-ignition switch state. Does the DRBIII® display any closed switches or VTSS related DTCs? Yes → Refer to the Symptom List and diagnose the appropriate symptom in the CHIME, DOOR AJAR or VTSS category. Perform VTSS VERIFICATION TEST - 1A. No → Replace the Body Control Module. Perform VTSS VERIFICATION TEST - 1A.	All

Symptom:
*VTSS DOES NOT TRIP FROM DRIVERS DOOR

POSSIBLE CAUSES
BCM-NO VTSS TRIP FROM DRVR DOOR
CHECK DRBIII® FOR DRIVER DOOR AJAR RESPONSE

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, read the DRVR DOOR AJAR SW status. Open the driver door. Does the DRBIII® display CLOSED? Yes → Replace the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Refer to symptom DRIVER DOOR AJAR CKT OPEN in the DOOR AJAR category. Perform VTSS VERIFICATION TEST - 1A.	All

Symptom:
*VTSS DOES NOT TRIP FROM HOOD (IF EQUIPPED)

POSSIBLE CAUSES
CHECK DRBIII® FOR HOOD AJAR RESPONSE
BCM-NO VTSS TRIP FROM HOOD

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, read the HOOD AJAR SW status. Open the hood. Does the DRBIII® display CLOSED? Yes → Replace the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Refer to symptom HOOD AJAR CKT OPEN in the DOOR AJAR category. Perform VTSS VERIFICATION TEST - 1A.	All

Symptom:

*VTSS DOES NOT TRIP FROM LEFT REAR DOOR

POSSIBLE CAUSES
CHECK DRBIII® FOR LEFT REAR DOOR AJAR RESPONSE
BCM-NO VTSS TRIP FROM LR DOOR

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, read the LR DOOR AJAR SW status. Open the left rear door. Does the DRBIII® display CLOSED? Yes → Replace the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Refer to symptom LEFT REAR DOOR AJAR CKT OPEN in the DOOR AJAR category. Perform VTSS VERIFICATION TEST - 1A.	All

Symptom:
*VTSS DOES NOT TRIP FROM LIFTGATE

POSSIBLE CAUSES
CHECK DRBIII® FOR LIFTGATE SW RESPONSE
BCM-NO VTSS TRIP FROM LIFTGATE

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, read the LIFTGATE SW status. Open the liftgate. Does the DRBIII® display CLOSED? Yes → Replace the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Refer to symptom LIFTGATE AJAR CKT OPEN in the DOOR AJAR category. Perform VTSS VERIFICATION TEST - 1A.	All

Symptom:
*VTSS DOES NOT TRIP FROM LIFTGATE FLIP-UP GLASS ONLY

POSSIBLE CAUSES
CHECK DRBIII® FOR LIFTGATE FLIP-UP RESPONSE
BCM-NO VTSS TRIP FROM LIFTGATE FLIP-UP GLASS

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, read the LIFTGLASS SW status. Open the liftgate flip-up glass. Does the DRBIII® display CLOSED? Yes → Replace the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Refer to symptom Lftgate Flip-Up Ajar Circuit Open in the DOOR AJAR category. Perform VTSS VERIFICATION TEST - 1A.	All

Symptom:
*VTSS DOES NOT TRIP FROM PASSENGER FRONT DOOR

POSSIBLE CAUSES
CHECK DRBIII® FOR PASSENGER DOOR AJAR RESPONSE
BCM-NO VTSS TRIP FROM PASSENGER DOOR

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, read the PASS DOOR AJAR SW status. Open the passenger door. Does the DRBIII® display CLOSED? Yes → Replace the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Refer to symptom PASSENGER DOOR AJAR CKT OPEN in the DOOR AJAR category. Perform VTSS VERIFICATION TEST - 1A.	All

Symptom:
*VTSS DOES NOT TRIP FROM RIGHT REAR DOOR

POSSIBLE CAUSES
CHECK DRBIII® FOR RIGHT REAR DOOR AJAR RESPONSE
BCM-NO VTSS TRIP FROM RR DOOR

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, read the RR DOOR AJAR SW status. Open the right rear door. Does the DRBIII® display CLOSED? Yes → Replace the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Refer to symptom RIGHT REAR DOOR AJAR CKT OPEN in the DOOR AJAR category. Perform VTSS VERIFICATION TEST - 1A.	All

Symptom:
*VTSS INDICATOR INOPERATIVE

POSSIBLE CAUSES
OPEN VTSS INDICATOR FUSED B(+) SUPPLY
OPEN VTSS LED
VTSS INDICATOR DRIVER CIRCUIT OPEN
BODY CONTROL MODULE--OPEN INTERNAL VTSS DRIVER

TEST	ACTION	APPLICABILITY
1	Disconnect the Automatic Headlamp Light Sensor/VTSS LED harness connector. Measure the voltage of the Fused B+ circuit. Is the voltage above 10.0 volts? Yes → Go To 2 No → Repair the VTSS Fused B+ circuit for an open. Perform VTSS VERIFICATION TEST - 1A.	All
2	Disconnect the Automatic Headlamp Light Sensor VTSS/LED harness connector. Using a 12-volt test light connected to 12-volts, check the VTSS Indicator Driver circuit. Turn the ignition on. With the DRB in Vehicle Theft, actuate the VTSS Indicator lamp. Does the test light illuminate when the VTSS Indicator lamp is actuated? Yes → Replace the Automatic Headlamp Light Sensor/VTSS LED assembly. Perform VTSS VERIFICATION TEST - 1A. No → Go To 3	All
3	Disconnect the Automatic Headlamp Light Sensor/ VTSS LED harness connector. Disconnect the BCM C1 harness connector. Measure the resistance of the VTSS Indicator Driver circuit. Is the resistance below 5.0 ohms? Yes → Replace the Body Control Module. Perform VTSS VERIFICATION TEST - 1A. No → Repair the VTSS Indicator Driver circuit for an open. Perform VTSS VERIFICATION TEST - 1A.	All

Symptom:
RAIN SENSOR FAULT

When Monitored and Set Condition:

RAIN SENSOR FAULT

When Monitored: Ignition on.

Set Condition: When the BCM detects a fault from the Rain Sensor Module.

POSSIBLE CAUSES
INTERMITTENT CONDITION
MULTIFUNCTION SWITCH
RAIN SENSOR MODULE
BODY CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, clear all BCM DTC's. Turn the right side multifunction switch to the AUTO position. With the DRBIII®, read the DTC information. Does the DRBIII® read: Rain Sensor Fault? Yes → Go To 2 No → The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the right side Multifunction Switch harness connector. Turn the ignition on. With the DRBIII®, select Body, Body Control Module and read the Multifunction Switch voltage. Does the DRBIII® display voltage above 4.75 volts? Yes → Replace the right side Multifunction Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition on. Turn the right side multifunction switch to the AUTO position. Using a spray bottle, spray water on the RSM area of the windshield. Using the DRBIII® monitor the wipe commands to the BCM from the RSM. Were any wipe commands transmitted to the BCM from the RSM? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Rain Sensor Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
WASHER FLUID SENSOR FAILURE

When Monitored and Set Condition:

WASHER FLUID SENSOR FAILURE

When Monitored: Ignition key in run position.

Set Condition: If the resistance of the washer fluid level sensor input to the BCM is high causing the voltage to be above 4.8 volts for 5 seconds or more.

POSSIBLE CAUSES
VERIFYING ACTIVE DTC - WASHER FLUID SENSOR FAILURE
WASHER FLUID LEVEL SWITCH CIRCUIT VERIFICATION

TEST	ACTION	APPLICABILITY
1	Turn ignition on. With the DRBIII, Erase BCM DTC's Turn ignition off then turn ignition on. Turn the wiper switch to each intermittent position, then low and high speed positions, then push the washer switch. Wait 5 minutes before reading the BCM DTC. With the DRBIII read BCM DTC's. Does the DRB show "WASHER FLUID SENSOR FAILURE"? Yes → Go To 2 No → Test Complete, code not present at this time.	All
2	With the DRBIII, access BCM Sensors. Turn ignition on. Read the Washer Fluid level switch voltage. Is the Washer Fluid Level Switch voltage above 4.8 volts? Yes → Test Complete. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
WIPER ON/OFF RELAY SHORTED HIGH

When Monitored and Set Condition:

WIPER ON/OFF RELAY SHORTED HIGH

When Monitored: The ignition must be in the run position and battery voltage supplied to the BCM on the Fused B(+) circuit.

Set Condition: If the BCM detects high current on the wiper on/off relay control circuit the code will set.

POSSIBLE CAUSES
VERIFYING ACTIVE DTC - WIPER ON/OFF RELAY CONTROL CIRCUIT SHORTED HIGH
WIPER ON/OFF RELAY COIL SHORTED
WIPER ON/OFF RELAY CONTROL CIRCUIT SHORTED TO BATTERY
BCM DEFECTIVE - WIPER ON/OFF RELAY

TEST	ACTION	APPLICABILITY
1	Turn ignition on. With the DRBIII, Erase BCM DTC's Turn ignition off then turn ignition on. Turn the wiper switch to each intermittent position, then low and high speed positions. With the DRBIII read BCM DTC's. Does the DRB show "WIPER ON/OFF RELAY SHORTED HIGH"? Yes → Go To 2 No → Test Complete, code not present at this time.	All
2	Turn ignition off. Remove the On/Off Relay. **Note: Check connectors - Clean / repair as necessary.** Using an ohmmeter, measure between terminals #85 and #86 of the Wiper On/Off Relay. Is the resistance below 50 ohms? Yes → Replace the Wiper ON/Off Relay. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

WIPER ON/OFF RELAY SHORTED HIGH — Continued

TEST	ACTION	APPLICABILITY
3	Turn the Ignition Off. Remove the Wiper On/Off Relay. Disconnect the BCM C1 Connector. **Note: Check connectors - Clean/repair as necessary.** Turn the Ignition On (Engine Off). Using a voltmeter, measure the Wiper On/Off Relay Control circuit at the BCM C1 Connector. Is the voltage above 1.0 volts? Yes → Repair the Wiper On/Off Relay Control circuit shorted to battery. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the Ignition Off. Disconnect the Wiper On/Off Relay. **Note: Check connectors - Clean/repair as necessary.** Connect a voltmeter between cavity 85 of the On/Off Relay and chassis ground. Turn ignition on. Is the voltage above 1.0 volts? Yes → Replace the Body Control Module. Wiper On/Off Relay Control circuit shorted to battery. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
WIPER ON/OFF RELAY SHORTED LOW/OPEN CIRCUIT

When Monitored and Set Condition:

WIPER ON/OFF RELAY SHORTED LOW/OPEN CIRCUIT

When Monitored: The ignition must be in the run position and battery voltage supplied to the BCM on the Fused B(+) circuit.

Set Condition: If the BCM cannot sense any voltage on the wiper on/off relay control circuit.

POSSIBLE CAUSES
JUNCTION BLOCK CIRCUIT BREAKER C1 OPEN
VERIFYING ACTIVE DTC - WIPER ON/OFF RELAY CONTROL CIRCUIT SHORTED LOW/OPEN
FUSED IGNITION SWITCH OUTPUT RUN/ACC CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT CIRCUIT SHORTED TO GROUND
FUSED IGNITION SWITCH OUTPUT RUN/ACC CIRCUIT SHORTED TO GROUND
COMMON CIRCUIT SHORTED TO GROUND
HIGH SPEED OUTPUT SHORTED TO GROUND
LOW SPEED OUTPUT SHORTED TO GROUND
WIPER ON/OFF RELAY CONTROL CIRCUIT OPEN
WIPER ON/OFF RELAY CONTROL CIRCUIT SHORTED TO GROUND
BCM DEFECTIVE- WIPER ON/OFF RELAY CIRCUIT SHORTED LOW/OPEN

TEST	ACTION	APPLICABILITY
1	Turn ignition on. With the DRBIII, Erase BCM DTC's Turn ignition off then turn ignition on. Turn the wiper switch to each intermittent position, then low and high speed positions. With the DRBIII read BCM DTC's. Does the DRB show ″WIPER ON/OFF RELAY OUTPUT SHORTED LOW/OPEN″? Yes → Go To 2 No → Test Complete, code not present at this time.	All
2	Disconnect the Junction Block Circuit Breaker C1. **Note: Check connectors - Clean/repair as necessary.** Install a known good circuit breaker in place of the Junction Block C1 Circuit Breaker. Does the system now operate correctly? Yes → Replace the Junction Block Circuit Breaker C1. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

WIPER ON/OFF RELAY SHORTED LOW/OPEN CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
3	Remove the Wiper On/Off Relay. Remove the Junction Block C1 Circuit Breaker. **Note: Check connectors - Clean / repair as necessary.** Connect a jumper wire between the Junction Block C2-9 Fused Ignition Switch Output Run/ACC and ground. Using an Ohmmeter, measure the Fused Ignition Switch Output Run/ACC circuit from the Wiper On/Off Relay connector (cavity 86) and ground. Is the resistance below 5.0 Ohms? Yes → Go To 4 No → Repair the open Fused Ignition Switch Output Run/ACC circuit. Perform BODY VERIFICATION TEST - VER 1.	All
4	Turn the Ignition Off. Remove the Junction Block C1 Circuit Breaker. Disconnect the Wiper On/Off Relay. **Note: Check connectors - Clean/repair as necessary.** Using an ohmmeter, measure the Fused Ignition Switch Output circuit between the On/Off Relay (Cavity 86) and ground. Is the resistance below 10.0 ohms? Yes → Repair the Fused Ignition Switch Output Run/ACC circuit shorted to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the Ignition Off. Disconnect the Wiper Motor connector. Disconnect the Junction Block C1 Circuit Breaker. **Note: Check connectors - Clean/repair as necessary.** Using an ohmmeter, measure the Fused Ignition Switch Output Run/ACC circuit between the Wiper Motor Connector and ground. Is the resistance below 5.0 ohms? Yes → Repair the Fused Ignition Switch Output Run/ACC circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 6	All
6	Turn the Ignition Off. Remove the Wiper High/Low and On/Off Relays. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the Wiper Relay Common circuit between the High/Low Relay (cavity 30) and ground. Is the resistance below 10.0 ohms? No → Go To 7 Yes → Repair the Wiper Relay Common circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1.	All

WIPER ON/OFF RELAY SHORTED LOW/OPEN CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
7	Turn the Ignition Off. Disconnect the Wiper High/Low Relay. Disconnect the Wiper Motor connector. **Note: Check connectors - Clean/repair as necessary.** Using an ohmmeter, measure the High Speed Output circuit at the High/Low Relay (cavity 87). Is the resistance below 10.0 ohms? Yes → Repair the High Speed Output circuit shorted to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 8	All
8	Turn the Ignition Off. Remove the Wiper High/Low Relay. Disconnect the Wiper Motor connector. **Note: Check connectors - Clean/repair as necessary.** Using an ohmmeter, measure the Low Speed Output circuit at the High/Low Relay (cavity 87A). Is the resistance below 10.0 ohms? Yes → Repair the Low Speed Output circuit shorted to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 9	All
9	Turn the Ignition Off. Remove the Wiper On/Off Relay. Disconnect the BCM C1 Connector. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire to the Wiper On/Off Relay Control circuit between the Body Control Module C1 connector and ground. Using a ohmmeter, measure the Wiper On/Off Relay Control circuit between the Wiper On/Off Relay cavity 85 of the Power Distribution Center and ground. Is the resistance below 5.0 ohms? Yes → Go To 10 No → Repair the open Wiper On/Off Relay Control circuit. Perform BODY VERIFICATION TEST - VER 1.	All
10	Turn the Ignition Off. Disconnect the Wiper On/Off Relay. Disconnect the BCM C1 Connector. **Note: Check connectors - Clean/repair as necessary.** Using a ohmmeter, measure the Wiper On/Off Relay Control circuit between the Wiper On/Off Relay cavity 85 of the Power Distribution Center and ground. Is the resistance below 5.0 ohms? Yes → Repair the Wiper On/Off Relay Control circuit shorted to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 11	All

WIPER ON/OFF RELAY SHORTED LOW/OPEN CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
11	Turn the Ignition Off. Disconnect the Wiper On/Off Relay. **Note: Check connectors - Clean/repair as necessary.** Connect a test light between cavity 85 and 86 of the Wiper On/Off Relay in the Power Distribution Center. Turn the Ignition On (Engine Off). With the DRBIII actuate the Wiper Relay. Does the test light pulse on and off with the DRBIII actuating the wiper relay? Yes → Test Complete. No → Replace the Body Control Module,shorted low/open. Perform BODY VERIFICATION TEST - VER 1. **Note: Stop the Wiper Motor actuation.**	All

Symptom:
WIPER PARK SWITCH FAILURE

When Monitored and Set Condition:

WIPER PARK SWITCH FAILURE

When Monitored: The ignition must be in the run position and battery voltage supplied to the BCM on the Fused B(+) circuit.

Set Condition: The code will set if the BCM does not detect a low to high voltage transition on the Wiper Park Switch Sense circuit within 8 seconds after energizing the wiper relay On/Off relay.

POSSIBLE CAUSES
WIPER PARK SWITCH OPERATION
WIPER PARK SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
WIPER PARK SWITCH SENSE CIRCUIT OPEN
WIPER PARK SWITCH SENSE CIRCUIT SHORT TO GROUND
GROUND CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT RUN/ACC CIRCUIT OPEN
WIPER MOTOR OPERATION
BCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, erase BCM DTC's. Cycle the ignition off and then on. Turn the windshield wiper switch to each intermittent position, then low and high speed positions. Turn the windshield wiper switch to the Low Speed position. With the DRBIII®, read BCM DTC's. Does the DRB display WIPER PARK SWITCH FAILURE? Yes → Go To 2 No → At this time the condition to set the code is not present. Inspect the related wiring harness and connectors, repair as necessary. Perform BODY VERIFICATION TEST - VER 1.	All

WIPER PARK SWITCH FAILURE — Continued

TEST	ACTION	APPLICABILITY
2	Turn the ignition off. Disconnect the Windshield Wiper Motor harness connector. Disconnect the Junction Block C2 harness connector. Turn the ignition on. Measure the voltage of the Wiper Park Switch Sense circuit in the Windshield Wiper Motor harness connector. Is there any voltage present? Yes → Repair the Wiper Park Switch Sense circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the Windshield Wiper Motor harness connector. Disconnect the Junction Block C2 harness connector. Measure the resistance of the Wiper Park Switch Sense circuit between the Junction Block C2 harness connector and the Wiper Motor harness connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the Wiper Park Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
4	Turn the ignition off. Disconnect the Windshield Wiper Motor harness connector. Disconnect the Junction Block C2 harness connector. Measure the resistance between ground and the Wiper Park Switch Sense circuit in the Junction Block C2 harness connector. Is the resistance below 100.0 ohms? Yes → Repair the Wiper Park Switch Sense circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Disconnect the Windshield Wiper Motor harness connector. **NOTE: Ensure the ignition switch, all lights and accessories are turned off.** Using a 12-volt test light connected to 12-volts, probe the Ground circuit in the Windshield Wiper Motor harness connector. Does the test light illuminate brightly? Yes → Go To 6 No → Repair the Wiper Motor Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
6	Disconnect the Wiper Motor connector. Turn ignition on. Using a voltmeter measure the Fused Ignition Switch Output Run/ACC circuit at the Wiper Motor connector. Is the voltage above 10 volts? Yes → Go To 7 No → Repair the open Fused Ignition Switch Output Run/ACC circuit. Perform BODY VERIFICATION TEST - VER 1.	All

WIPER PARK SWITCH FAILURE — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off. Disconnect the Windshield Wiper Motor harness connector. Turn the ignition on. With the DRBIII® in Inputs/Outputs, read the wiper park switch state. Connect one end of a jumper wire to the wiper park switch sense circuit at the windshield wiper motor harness connector. While observing the DRBIII®, connect the other end of the jumper wire to ground for several seconds, then disconnect the jumper wire from ground. Did the wiper park switch input change state when connected to ground then disconnected from ground? Yes → Replace the Wiper Motor. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:
WIPER SWITCH MUX CKT OPEN

When Monitored and Set Condition:

WIPER SWITCH MUX CKT OPEN

When Monitored: The ignition must be in the run position and battery voltage supplied to the BCM on the Fused B(+) circuit.

Set Condition: If the voltage on the wiper switch MUX circuit is above 4.8 volts for more than 5 seconds the code will set.

POSSIBLE CAUSES
VERIFYING ACTIVE DTC - WIPER SWITCH MUX CIRCUIT OPEN
WIPER SWITCH RETURN CIRCUIT OPEN
WINDSHIELD WIPER SWITCH MUX CIRCUIT OPEN
RIGHT MULTI - FUNCTION SWITCH DEFECTIVE, WINDSHIELD WIPER SWITCH MUX CKT OPEN
BCM DEFECTIVE - WIPER MUX CIRCUIT OPEN

TEST	ACTION	APPLICABILITY
1	Turn ignition on. With the DRBIII, Erase BCM DTC's Turn ignition off then turn ignition on. Turn the wiper switch to each intermittent position, then low and high speed positions. With the DRBIII read BCM DTC's. Does the DRB show ″WIPER SWITCH MUX CIRCUIT OPEN″? Yes → Go To 2 No → Test Complete, code not present at this time.	All
2	Turn ignition off. Disconnect the Right Multi - Function Switch connector. Disconnect the BCM C2 connector. Using an ohmmeter, Measure the resistance of the Wiper Switch Return circuit between the BCM C2 connector and the Right Multi - Function connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open Windshield Wiper Switch Return circuit. Perform BODY VERIFICATION TEST - VER 1.	All

WIPER SWITCH MUX CKT OPEN — Continued

TEST	ACTION	APPLICABILITY
3	Turn ignition off. Disconnect the Right Multi - Function Switch connector. Disconnect the BCM C2 connector. Using an ohmmeter, Measure the resistance of the Windshield Wiper Switch MUX circuit between the BCM C2 connector and the Right Multi - Function connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open Windshield Wiper Switch MUX circuit. Perform BODY VERIFICATION TEST - VER 1.	All
4	Turn ignition off. Disconnect the Right Multi - Function Switch Connector. Turn the Windshield Wiper Switch to the ″OFF″ position. Connect an ohmmeter between the Right Multi - Function Switch terminals #7 and #8. Observe the ohmmeter while turning the Windshield Wiper Switch from the ″ OFF″ position to the ″High speed″ position. Is the resistance below 40.0 ohms in any position Yes → Replace the Right Multi - Function Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the Ignition Off. With a jumper, back probe a jumper wire between the Wiper Switch Return Circuit and the Windshield Wiper Switch MUX circuit at the BCM C2 connector. Turn Ignition on. With the DRBIII, read the WIPER MODE SW VOLTS sensor. Does the DRBIII show the sensor volts above 4.8 volts? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
WIPER SWITCH MUX CKT SHORT TO GROUND

When Monitored and Set Condition:

WIPER SWITCH MUX CKT SHORT TO GROUND

When Monitored: The ignition must be in the run position and battery voltage supplied to the BCM on the Fused B(+) circuit.

Set Condition: If the voltage on the wiper switch MUX circuit drops below 0.3 volts for more than 5 seconds the code will set.

POSSIBLE CAUSES
VERIFYING ACTIVE DTC - WIPER SWITCH MUX CIRCUIT SHORTED TO GROUND
WINDSHIELD WIPER SWITCH MUX CIRCUIT SHORTED TO GROUND
RIGHT MULTI - FUNCTION SWITCH DEFECTIVE, WIPER MUX CIRCUIT SHORTED TO GROUND
BCM DEFECTIVE - WIPER MUX CIRCUIT SHORTED TO GROUND

TEST	ACTION	APPLICABILITY
1	Turn ignition on. With the DRBIII, Erase BCM DTC's Turn ignition off then turn ignition on. Turn the wiper switch to each intermittent position, then low and high speed positions. With the DRBIII read BCM DTC's. Does the DRB show "WIPER SWITCH MUX CIRCUIT SHORTED TO GROUND"? Yes → Go To 2 No → Test Complete, code not present at this time.	All
2	Turn ignition off. Disconnect the Right Multi - Function Switch connector. Disconnect the BCM C2 connector. Using an ohmmeter, Measure the resistance of the Windshield Wiper Switch MUX circuit between the BCM C2 connector and ground. Is the resistance below 5.0 ohms? Yes → Repair the Windshield Wiper Switch MUX circuit shorted to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All

WIPER SWITCH MUX CKT SHORT TO GROUND — Continued

TEST	ACTION	APPLICABILITY
3	Turn ignition off. Disconnect the Right Multi - Function Switch Connector. Turn the Windshield Wiper Switch to the ″OFF″ position. Using an ohmmeter, measure between the Windshield Wiper Switch MUX circuit and the Wiper Switch Return circuit of the Right Multi - Function Switch. Observe the ohmmeter while turning the Windshield Wiper Switch from the ″ OFF″ position to the ″High speed″ position. Is the resistance below 40.0 ohms in any position. Yes → Replace the Right Multi - Function Switch. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the Ignition Off. Disconnect the BCM C2 connector. Turn Ignition on. With the DRBIII, read the ″WIPER MODE SW VOLTS″ sensor. Does the DRBIII show the sensor volts below 0.3 volts? Yes → Replace the Body Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Test Complete.	All

Verification Tests

45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1	APPLICABILITY
1. Connect the DRBIII® to the Data Link Connector. 2. Reconnect any disconnected components. 3. With the DRBIII®, erase DTC's. 4. With the DRBIII®, display Transmission Temperature. Start and run the engine until the Transmission Temperature is HOT above 43° Celsius 110° Fahrenheit. 5. Check the Transmission fluid and adjust if necessary. Refer to the Service Information for the Fluid Fill procedure. **6. NOTE: If the TCM has been replaced or if the transmission has been repaired or replaced it is necessary to perform the DRBIII® Quick Learn Procedure.** 7. Road test the vehicle. With the DRBIII®, monitor TPS. Make fifteen to twenty 1-2, 2-3, and 3-4 upshifts and (4 - 4prime for 545RFE only). 8. Perform these shifts from a standing start to 97 Km/h 60 MPH with a constant throttle opening of 20 to 25 degrees. 9. Below 40 Km/h 25 MPH, make five to eight wide open throttle kickdowns to 1st gear. Allow at least 5 seconds each in 2nd and 3rd gear between each kickdown. 10. Check for DTC's during the road test. **11. NOTE: Use the EATX OBDII task manager to run Good Trip time in each gear, this will confirm the repair and to ensure that the DTC has not re-matured.** Were any Trouble Codes set during the road test? Yes → Refer to the Symptom List for the appropriate diagnostic tests. No → Repair is complete.	All

ABS VERIFICATION TEST - VER 1	APPLICABILITY
1. Turn the ignition off. 2. Connect all previously disconnected components and connectors. 3. Ensure all accessories are turned off and the battery is fully charged. 4. Ensure that the Ignition is on, and with the DRBIII, erase all Diagnostic Trouble Codes from ALL modules. Start the engine and allow it to run for 2 minutes and fully operate the system that was malfunctioning. 5. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the DRBIII, read DTC's from ALL modules. 6. If any Diagnostic Trouble Codes are present, return to Symptom list and troubleshoot new or recurring symptom. **7. NOTE: For Sensor Signal and Pump Motor faults, the CAB must sense all 4 wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator.** 8. If there are no DTC's present after turning ignition on, road test the vehicle for at least 5 minutes. Perform several antilock braking stops. **9. Caution: Ensure braking capability is available before road testing.** 10. Again, with the DRBIII® read DTC's. If any DTC's are present, return to Symptom list. 11. If there are no Diagnostic Trouble Codes (DTC's) present, and the customer's concern can no longer be duplicated, the repair is complete. Are any DTC's present or is the original concern still present? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

Verification Tests — Continued

ADJUSTABLE PEDALS VERIFICATION TEST - VER 1	APPLICABILITY
1. If the Adjustable Pedals Module was replaced, program two pedal positions if equipped with memory function. 2. Activate the Adjustable Pedals through the full range of movement. 3. Verify that the Adjustable Pedals system is disabled with the vehicle in Reverse. 4. Verify that the Adjustable Pedals system is disabled with Speed Control activated. 5. With the DRBIII®, erase DTCs. 6. With the DRBIII®, read DTCs. Are any DTC's present or is the original complaint still present? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

AIRBAG VERIFICATION TEST - VER 1	APPLICABILITY
1. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery. **2. WARNING: TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.** 3. Connect the DRBIII® to the Data Link Connector - use the most current software available. 4. Use the DRBIII® and erase the stored codes in all airbag system modules. 5. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On. 6. Wait one minute, and read active codes and if there are none present read the stored codes. 7. Note: If equipped with Airbag On-Off switch, read the DTC's in all switch positions. 8. Note: Read the DTC's in all airbag system related modules. 9. If the DRBIII® shows any active or stored codes, return to the Symptom list and follow path specified for that trouble code. If no active or stored codes are present, the repair is complete. Are any DTC's present or is the original condition still present? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

Verification Tests — Continued

BODY VERIFICATION TEST - VER 1	APPLICABILITY
1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors. 2. If the Sentry Key Immobilizer Module (SKIM) or the Powertrain Control Module (PCM) were replaced, proceed to number 9. If the SKIM or PCM were not replaced, continue to the next number. 3. If the Body Control Module was replaced, turn the ignition on for 15 seconds before attempting to start (to learn VIN). 4. If the vehicle is equipped with VTSS, use the DRBIII and enable VTSS. Program other options as necessary. 5. (Export only) If the Intrusion Transceiver Module (ITM) was replaced, use the DRBIII® to enable the ITM and Program Interior type. 6. (Export only) If the Siren was replaced perform the DRBIII® Siren Replacement procedure. 7. If the Passenger Door Module was replaced, use the DRBIII and program all RKE transmitters used with this vehicle. 8. If any repairs were made to the HVAC System, disconnect the battery for 30 seconds and then reconnect or using the DRBIII, recalibrate the HVAC doors. Proceed to number 16. 9. Obtain the Vehicle's unique PIN assigned to it's original SKIM from either the vehicle's invoice or from Chrysler's Customer Center (1-800-992-1997). 10. With the DRBIII, select THEFT ALARM, SKIM, MISCELLANEOUS and select SKIM REPLACED. Enter the 4 digit PIN to put SKIM in Secured Access Mode. 11. The DRBIII will prompt you through the following steps. (1) Program the country code into the SKIM's memory. (2) Program the vehicle's VIN into the SKIM's memory. (3) Transfer the vehicle's Secret Key data from the PCM. 12. Once secured access mode is active, the SKIM will remain in that mode for 60 seconds. 13. Using the DRBIII, program all customer keys into the SKIM's memory. This requires that the SKIM be in secured access mode, using the 4 digit code. 14. Note: If the PCM is replaced, the VIN and the unique Secret Key data must be transfered from the SKIM to the PCM. This procedure requires the SKIM to be placed in secured access mode using the 4-digit code. 15. Note: If 3 attempts are made to enter secured access mode using an incorrect PIN, secured access mode will be locked out for 1 hour which causes the DRBIII to display BUS +\- SIGNALS OPEN. To exit this mode, turn ignition to the RUN position for 1 hour. 16. Ensure all accessories are turned off and the battery is fully charged. 17. Ensure that the Ignition is on, and with the DRBIII, erase all Diagnostic Trouble Codes from ALL modules. Start the engine and allow it to run for 2 minutes and fully operate the system that was malfunctioning. 18. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the DRBIII, read DTC's from ALL modules. Are any DTC's present or is the original complaint still present? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

Verification Tests — Continued

POWERTRAIN VERIFICATION TEST VER - 1	APPLICABILITY
1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary. 2. Inspect the engine oil for contamination. If oil contamination is suspected, change the oil and filter. 3. If the PCM was not replaced skip steps 4 through 6 and continue the verification. 4. If the PCM was replaced the correct VIN and mileage must be programmed or a DTC will set in the ABS and Air Bag modules. In addition, if the vehicle is equipped with Sentry Key Immobilizer Module (SKIM), Secret Key data must be updated to enable start. 5. For ABS and Air Bag systems: Enter correct VIN and Mileage in PCM. Erase codes in ABS and Air Bag modules. 6. For SKIM theft alarm: Connect DRBIII® to data link conn. Go to Theft Alarm, SKIM, Misc. and place SKIM in secured access mode, by using the appropriate PIN code for this vehicle. Select Update the Secret Key data. Data will be transferred from SKIM to PCM 7. Attempt to start the engine. Is the vehicle still unable to start or are there any DTCs or symptoms remaining? Yes → Check for any related Technical Service Bulletins and/or refer to the appropriate Symptoms list (Diagnostic Procedure). No → Repair is complete.	All

ROAD TEST VERIFICATION - VER-2	APPLICABILITY
1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary. 2. If this verification procedure is being performed after a non-DTC test, perform steps 3 and 4. 3. Check to see if the initial symptom still exists. If there are no trouble codes and the symptom no longer exists, the repair was successful and testing is now complete. 4. If the initial or another symptom exists, the repair is not complete. Check all pertinent Technical Service Bulletins (TSBs) and return to the Symptom List if necessary. 5. For previously read DTCs that have not been dealt with, return to the Symptom List and follow the diagnostic path for that DTC; otherwise, continue. 6. If the Engine Control Module (ECM) has not been changed, perform steps 7 and 8, otherwise, continue with step 9. 7. With the DRB, erase all diagnostic trouble codes (DTCs), then disconnect the DRB. 8. Turn the ignition off for at least 10 seconds. 9. If equipped with a Transfer Case Position Switch, perform step 10, otherwise, continue with step 11. 10. With the ignition switch on, place the Transfer Case Shift Lever in each gear position, stopping for 15 seconds in each position. 11. Ensure no DTCs remain by performing steps 12 through 15. 12. Road test the vehicle. For some of the road test, go at least 64 km/h (40 MPH). If this test is for an A/C Relay Control Circuit, drive the vehicle for at least 5 minutes with the A/C on. 13. At some point, stop the vehicle and turn the engine off for at least 10 seconds, then restart the engine and continue. 14. Upon completion of the road test, turn the engine off and check for DTCs with the DRB. 15. If the repaired DTC has reset, the repair is not complete. Check for any pertinent Technical Service Bulletins (TSBs) and return to the Symptom List. If there are no DTCs, the repair was successful and is now complete. Are any DTCs or symptoms remaining? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

Verification Tests — Continued

SKIS VERIFICATION	APPLICABILITY
1. Reconnect all previously disconnected components and connectors. 2. Obtain the vehicle's unique Personal Identification Number (PIN) assigned to it's original SKIM. This number can be obtained from the vehicle's invoice or Chrysler's Customer Center (1-800-992-1997). **3. NOTE: When entering the PIN, care should be taken because the SKIM will only allow 3 consecutive attempts to enter the correct PIN. If 3 consecutive incorrect PINs are entered, the SKIM will Lock Out the DRB for 1 hour.** 4. To exit Lock Out mode, the ignition key must remain in the Run position continually for 1 hour. Turn off all accessories and connect a battery charger if necessary. 5. With the DRB, select Theft Alarm, SKIM and Miscellaneous. Then, select the desired procedure and follow the steps that will be displayed. 6. If the SKIM has been replaced, ensure all of the vehicle ignition keys are programmed to the new SKIM. **7. NOTE: Prior to returning vehicle to the customer, perform a module scan to be sure that all DTCs are erased. Erase any DTCs that are found.** 8. With the DRB, erase all DTCs. Perform 5 ignition key cycles leaving the key on for at least 90 seconds per cycle. 9. With the DRB, read the SKIM DTCs. Are there any SKIM DTCs? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

TIRE PRESSURE VERIFICATION TEST	APPLICABILITY
1. Perform the EVIC training as instructed in the System Description. 2. Using the DRBIII® or the EVIC RESET button, set the EVIC to Diagnostics mode (blank screen). **3. NOTE: Set the EVIC as follows:** 4. Press and hold the EVIC RESET button for five seconds (EVIC will beep). 5. Set the EVIC to display BLOCK COUNTERS. **6. NOTE: A vehicle graphic will display showing counters at wheel locations.** 7. Drive the vehicle at 40 km/h (25 mph) for at least 2 minutes. 8. Observe that the counters increment at least 3 sensor/transmitter receptions for each wheel. Can the EVIC be trained and do the counters show Sensor/Transmitter receptions? Yes → Repair is complete. No → Refer to Diagnosing System Faults in the Description and Operation for this system.	All

Verification Tests — Continued

VERIFICATION TEST -MEMORY SYSTEM	APPLICABILITY
1. Reconnect all previously disconnected components and connectors. 2. If any Memory/Heated Seat, or Driver's Door Module Trouble Codes are present, erase at this time. 3. If the Memory Seat Module was replaced, use the DRB III® and Reset Guard Bands. 4. With the Memory Switch on the Driver's Door, program the Driver's Seat #1 Button to a desired position and Driver #2 Button to a different position. 5. Remove the Ignition Key and close all Doors to allow the Body Control Module to time out (30 seconds). 6. Verify that both Memory positions can be recalled from the RKE transmitter and the Memory Switch on the Driver's Door. 7. Turn the ignition on, and with the DRBIII, erase all Diagnostic Trouble Codes from ALL modules. Start the engine and allow it to run for 2 minutes and fully operate the system that was malfunctioning. 8. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the DRBIII, read DTC's from ALL modules. Are any DTC's present or is the original complaint still present? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

VTSS VERIFICATION TEST - 1A	APPLICABILITY
1. Ensure all doors, hood, liftgate and liftgate flip-up are closed. 2. Open the driver's door. 3. Remove the ignition key (but keep in hand). 4. Lower the driver door window and lock the doors with RKE transmitter. 5. Close the driver's door. 6. Observe the VTSS Indicator. 7. The VTSS Indicator will flash rapidly for approximately 15 seconds and then begin to flash slowly. The VTSS indicator not performing as described, indicates a system fault. Refer to symptom list for problems related to THEFT ALARM WILL NOT ARM. 8. Perform a system test on the VTSS by duplicating the original complaint. 9. Disarm the system and with the DRBIII®, read DTC's. 10. If the original complaint is corrected and there are no DTC's the repair is complete. Are any DTC's present or is the original complaint still present? Yes → Repair is not complete, refer to the appropriate symptom. Perform VTSS VERIFICATION TEST - 1A. No → Repair is complete.	All

Verification Tests — Continued

W5AJ400 TRANSMISSION VERIFICATION TEST - VER 1	APPLICABILITY
1. Connect the DRBIII® to the Data Link Connector. 2. Reconnect any disconnected components. 3. With the DRBIII®, erase DTC's. 4. With the DRBIII®, display Transmission Temperature. Start and run the engine until the Transmission Temperature is HOT above 43° Celsius 110° Fahrenheit. 5. Check the Transmission fluid and adjust if necessary. Refer to the Service Information for the Fluid Fill procedure. 6. Road test the vehicle. Make fifteen to twenty 1-2, 2-3, and 3-4 upshifts. 7. Perform these shifts from a standing start to 72 Km/h 45 MPH with a constant throttle opening of 20 to 25 degrees. 8. Below 40 Km/h 25 MPH, make five to eight wide open throttle kickdowns to 1st gear. Allow at least 5 seconds each in 2nd and 3rd gear between each kickdown. 9. Check for DTC's during the road test. 10. use the actuate all solenoids command check the fault status ?????????????? Were any Trouble Codes set during the road test? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

TABLE OF CONTENTS

TABLE OF CONTENTS - Continued

1.0 INTRODUCTION

The procedures contained in this manual include all the specifications, instructions, and graphics needed to diagnose Mark 20 Antilock Braking System (ABS) problems. The diagnostics in this manual are based on the failure condition or symptom being present at time of diagnosis.

Follow the recommendations below when choosing your diagnostic path.

1. First make sure the DRBIII® is communicating with the Controller Antilock Brake (CAB). If the DRBIII® displays a "No Response" condition, you must diagnose that first.
2. Read DTC's (diagnostic trouble codes) with the DRBIII®.
3. If no DTC's are present, identify the customer complaint.
4. Once the DTC or customer complaint is identified, locate the matching test in the Table of Contents and begin to diagnose the symptom.

All component location views are in Section 8.0. All connector pinouts are in Section 9.0. All schematics are in Section 10.0.

An asterisk (*) placed before the symptom description indicated a customer complaint.

When repairs are required, refer to the appropriate service manual for the proper removal and repair procedure.

Diagnostic procedures change every year. New diagnostic systems may be added; carryover systems may be enhanced. READ THIS MANUAL BEFORE TRYING TO DIAGNOSE A VEHICLE CODE. It is recommended that you review the entire manual to become familiar with all new and changed diagnostic procedures.

After using this book, if you have any comments or recommendations, please fill out the form at the back of the book and mail it back to us.

1.1 SYSTEM COVERAGE

This diagnostic manual covers the Teves Mark 20 Antilock Braking System (ABS) and the Adjustable Pedals system found on the Jeep Grand Cherokee.

1.2 SIX-STEP TROUBLESHOOTING PROCEDURE

Diagnosis of the antilock brake system is done in six basic steps:

- verification of complaint
- verification of any related symptoms
- symptom analysis
- problem isolation
- repair of isolated problem
- verification of proper operation

2.0 IDENTIFICATION OF SYSTEM

Vehicles equipped with the Teves Mark 20 antilock brake system can be identified by the presence of the hydraulic control unit located with the controller antilock brake (CAB) under the hood near the air cleaner housing.

Vehicles equipped with the Adjustable Pedals system will have an Adjustable Pedals Switch mounted below the instrument cluster and to the right of the steering column.

3.0 SYSTEM DESCRIPTION AND FUNCTIONAL OPERATION

3.1 TEVES ABS SYSTEM DESCRIPTION

A Controller Antilock Brake (CAB) module is used to monitor wheel speeds and to modulate (control) hydraulic pressure in each brake channel to prevent wheel lock-up during braking. The CAB also provides a vehicle speed signal (VSS) to the powertrain control module.

During a non-ABS stop, the system functions as a standard front/rear split configuration. The primary supplies brake fluid pressure to the front brakes, and the secondary supplies the rear brakes. A conventional combination/proportioning valve is not used. This system uses the existing ABS solenoids to replace and perform the same functions that the combination and proportioning valves do. The CAB has a special software program called Electronic Variable Brake Proportioning (EVBP), that monitors the wheel speeds and when certain criteria are met the software will enable the solenoids to perform the same brake fluid management control as the combination/proportioning valves.

During an ABS stop, the system still uses the front/rear hydraulic split; however, the brake system pressure is further split into three control channels. During ABS operation, the front wheels are controlled independently and are on two separate control channels. The rear wheels are controlled together through one control channel. By using separate control channels for each front wheel, more steering control is maintained during maximum braking.

During an antilock stop, "wheel lock-up" does not necessarily mean that the wheel has locked, it means only that the wheel is turning slower than the vehicle speed. This is called "wheel slip" and is indicated as a percentage. 0% slip means that the wheel is rolling free and 100% slip means that the wheel is locked. The antilock system maintains an average of approximately 20% wheel slip.

It is important to remember that the antilock brake system does not shorten the vehicle stopping distance under all driving conditions, but provides improved control of the vehicle while stopping. Vehicle stopping distance is still dependent on vehicle speed, weight, tires, road surface, and other factors.

3.1.1 PEDAL FEEL/VEHICLES CHARACTERISTICS

There are several pedal feel/vehicle characteristics that are considered normal for antilock braking that may require further explanation.

When stopping conditions activate the antilock brakes, the driver may feel some vibrations/ pulsations in the brake pedal and may hear the solenoid valves clicking and the pump motor running. The vibrations/pulsations are caused by the isolating, building and decaying of brake fluid pressure within the brake lines. The ABS prevents complete wheel lock-up, but some wheel slip is required for the best braking performance. This slip may result in some tire chirping, depending on the road surface. The chirping should not be interpreted as total wheel lock-up. Total wheel lock-up leaves black tire marks on dry pavement, antilock braking may leave some light marks.

At the end of an ABS stop, the ABS may function all the way down to near 0 km/h (0 mph). There may be a slight brake pedal drop anytime the ABS is deactivated.

In case of braking on a bumpy surface, the ABS module may detect wheel locking tendencies due to wheel hop and cycle ABS. In that event the brake pedal may pulsate with a perceived loss of deceleration. ABS braking may also be activated at times while on dry pavement with sand, gravel, or other loose debris on the road.

It should be noted that the pulsating pedal feel characteristic will not illuminate the brake warning lamps or set a trouble code that is stored in the Controller Antilock Brake (CAB). When investigating a hard pedal feel, inspect the sensor and tone wheel teeth for chips/broken teeth, damaged sensor pole tips, excessive runout of the tone wheel, or excessive gap.

3.1.2 SYSTEM COMPONENTS

ANTILOCK BRAKE SYSTEM

- controller antilock brake (CAB)
- vacuum booster
- master cylinder (w/center valves)
- hydraulic control unit (HCU)
- valve block assembly: 6 valve solenoids (3 inlet valves, 3 outlet valves)
  4 accumulators
- brake fluid level switch (part of the fluid reservoir)
- pump/motor assembly:
  1 motor
  2 pumps
- 4 wheel speed sensor/tone wheel assemblies
- ABS warning indicator
- fuses and wiring harness
- fluid reservoir (integral part of master cylinder assembly)

3.1.3 ABS AND RED BRAKE WARNING INDICATOR

The amber ABS warning indicator is located in the instrument cluster. It is used to inform the driver that the antilock function has been turned off due to a system malfunction. On the WJ, the CAB controls the lamp indirectly.

The CAB monitors its own functions. If the CAB determines that the ABS indicator should be on, the CAB sends a message via the PCI BUS to the instrument cluster and the cluster turns on the indicator.

The instrument cluster sends a message over the PCI BUS at regular intervals, if the CAB does not respond the instrument cluster will illuminate the ABS indicator.

The red brake warning indicator is located in the instrument cluster. It can be activated by application of the parking brake, a leak in the front or rear wheel brake hydraulic circuit which causes the master cylinder reservoir to be low on fluid, or by turning the ignition switch to the start position. The red brake warning indicator can also be turned on if the brake fluid level switch circuit becomes open or shorted to ground.

3.1.4 CONTROLLER ANTILOCK BRAKE (CAB)

The antilock brake controller (CAB) is a microprocessor-based device that monitors wheel speeds and controls the antilock functions.

The primary functions of the CAB are:

- monitor wheel speeds
- detect wheel locking tendencies
- control fluid pressure modulations to the brakes during antilock stop operation
- control the ABS warning indicator

- monitor the system for proper operation
- provide communication to the DRBIII® while in diagnostic mode
- store diagnostic information in non-volatile memory

The CAB continuously monitors the speed of each wheel. When a wheel locking tendency is detected, the CAB will command the appropriate HCU valve to modulate brake fluid pressure to that wheel. Brake pedal position is maintained during an antilock stop by being a closed system with the use of 3 accumulators. The CAB continues to control pressure in individual hydraulic circuits until a wheel locking tendency is no longer present. The CAB turns on the pump/motor during an antilock stop.

The antilock brake system is constantly monitored by the CAB for the proper operation. If the CAB detects a system malfunction, it can disable the antilock system and activate the ABS warning indicator. If the antilock function is disabled, the system will revert to standard base brake system operation.

The CAB inputs include the following:

- four wheel speed sensors
- brake lamp switch
- ignition switch
- battery voltage
- diagnostic communication (PCI BUS)

The CAB outputs include the following:

- six valve/solenoid drivers
- pump/motor actuation
- ABS warning indicator actuation
- red brake warning indicator actuation
- diagnostic communication (PCI BUS)

3.1.5 HYDRAULIC CONTROL UNIT

The hydraulic control unit (HCU) contains the valve block assembly, four accumulators, and the pump/motor assembly.

Valve Block Assembly: The valve block assembly contains 6 valves with three inlet valves and three outlet valves. The inlet valves are spring-loaded in the open position and the outlet valves are spring loaded in the closed position. During an antilock stop, these valves are cycled to maintain the proper slip ratio for each channel. The CAB monitors wheel speeds. If the CAB detects a wheel deceleration that is disproportionate to the other wheels, it will close the inlet valve to that wheel. This prevents any increase in fluid pressure. If the wheel continues to decelerate disporportionately, the CAB opens the outlet valve for that wheel to release fluid pressure from that channel. The released fluid is routed to the accumulators. When the wheel speed is no longer disproportionate to the other wheels, the inlet valve will return to its normally open position and the outlet valve will return to the normally closed position.

Pump/Motor Assembly: The pump/motor assembly provides the extra amount of fluid needed during antilock braking. The pump is supplied fluid that is released to the accumulators when the outlet valve is opened during an antilock stop. The pump is also used to drain the accumulator circuits after the antilock stop is complete. The pump is operated by an integral electric motor. This motor is controlled by the CAB. The CAB turns on the motor when an antilock stop is detected. The pump continues to run during the antilock stop and is turned off approximately 3-5 seconds after the stop is complete. The CAB monitors the pump/motor operation internally.

Accumulators: The accumulators provide temporary fluid storage during an antilock stop and are drained by the pump/motor.

3.1.6 SENSORS

Wheel Speed Sensors and Tone Wheels: One wheel speed sensor (WSS) is located at each wheel and sends a small digital signal to the control module (CAB). The CAB sends 12 volts down to the sensor. The sensor has an internal magneto resistance bridge that alters the voltage and amperage of the signal circuit. This voltage and amperage is changed by magnetic induction when a toothed sensor ring (tone wheel) passes by a stationary magnetic sensor (wheel speed sensor). The CAB measures the voltage and amperage of the digital signals for each wheel.

The front wheel sensor is attached to a boss in the steering knuckle. The tone wheel is an itegral part of the front axle shaft. The rear speed sensor is mounted in the caliper adapter plate (rear disc only) and the rear tone wheel is an integral part of the rear rotor hub. **The wheel speed sensor air gap is NOT adjustable. Because of internal circuitry, a resistance check of WJ wheel speed sensors will not determine correct or incorrect function.**

Correct antilock system operation is dependent on wheel speed signals from the wheel speed sensors. The vehicle's wheels and tires should all be the same size and type to generate accurate signals. In addition, the tires should be inflated to the recommended pressures for optimum system operation. Variations in wheel and tire size or significant variations in inflation pressure can produce inaccurate wheel speed signals; however, the system will continue to function when using the mini-spare. When driven over rough road surfaces, the rear wheel speed sensor signals may be erratic and cause a false trouble code (drum brakes only).

Brake Warning Indicator Switch: The brake warning indicator switch is a fluid level sending switch. The CAB sends out a 12 volt signal to the switch. The switch has a 1,000 ohm resistor inside of it. This resistor is used for diagnostic purposes. Normal voltage is about 2.3 volts. If the switch is disconnected the resistor will be pulled out of the circuit and the CAB will sense voltage at about 5 volts. If the fluid level becomes too low or the circuit is shorted to ground, the voltage will be about 0 volts. Any fault condition will illuminate the red brake warning indicator and the specific fault can be read on the DRBIII®.

3.2 ADJUSTABLE PEDALS SYSTEM DESCRIPTION

GENERAL

The Adjustable Pedals System (APS) is designed to enable the fore and aft repositioning of the brake and accelerator pedals. This results in improved ergonomics in relation to the steering wheel for taller and shorter drivers. Being able to adjust the pedal positions also allows the driver to set steering wheel tilt and seat position to the most comfortable position. The position of the brake and accelerator pedals can be adjusted without compromising safety or comfort in actuating the pedals. Repositioning the pedals does not change the effort required for actuation.

Change of pedal position is accomplished by means of a motor driven screw. Operating the adjustable pedal switch activates the pedal drive motor. The pedal drive motor turns a screw that changes the position of the brake and accelerator pedals. The pedal can be moved rearward (closer to the driver) or forward (away from driver). The brake pedal is moved on its activating lever to a position where the driver feels most comfortable.

The accelerator pedal is moved at the same time and the same distance as the brake pedal. The accelerator pedal adjustment screw is turned by a flexible shaft slaved off the brake adjustment screw.

Neither the pedal drive motor nor drive mechanism are subject to the mechanical stress of brake or accelerator application.

SYSTEM FEATURES

- Range of Adjustment
  The pedals may be adjusted up to 3 in. (75 mm)
- Pedal Adjustment Speed
  0.5 in./sec (12.5 mm/sec)
- Pedal Adjustment Inhibitors
  Pedal adjustment is inhibited when the vehicle is in reverse or when cruise control is activated.
- Memory
  An optional memory feature is available. This allows storing of one or two preferred pedal positions in the Adjustable Pedal Module (APM). A preferred position can be stored and recalled using the door-mounted switches.
  The door-mounted switches activate the Driver Door Module (DDM). The DDM instructs the APM via the PCI bus to store the current pedal position.
  A stored pedal position can be recalled (but not stored) using the Remote Keyless Entry (RKE).
- Adjustable Pedal Feedback Message
  The Electronic Vehicle Information Center (EVIC) will display a message when the APS is disabled. ie: “Adjustable Pedal Disabled — Cruise Control Engaged” or “Adjustable Pedal Disabled — Vehicle in Reverse”.
- Damage Prevention
  Foot pressure or debris can stall pedal adjustment. In order to avoid damage to system components during pedal adjustment, the APM will monitor pedal position sensor voltage. If the APM does not detect expected voltage change within 1.5 seconds, it will cut power to the adjustable pedal motor.

3.3 DIAGNOSTIC TROUBLE CODES

The vehicle electronic system modules may report any of several diagnostic trouble codes (DTC)s. The possible DTCs for the ABS and Adjustable Pedals System are listed in the table of contents.

Diagnostic trouble codes are retained in memory until erased using the DRB, or automatically erased after 255 key cycles or 3,500 miles.

3.3.1 ABS INITIALIZATION

System initialization starts when the key is turned to “run”. At this point, the CAB performs a complete self-check of all electrical components in the antilock brake systems.

At 20 km/h (12 mph) a dynamic test may be performed. If the brake lamp switch is activated the test will be run at 40 km/h (24 mph) regardless of the brake lamp switch state. This will momentarily run the pump/motor. If during the dynamic test, the driver has his/her foot on the brake pedal, he/she may feel the test through brake pedal pulsations. This is a normal condition.

If any component causes a diagnostic trouble code during system initialization or dynamic check, the CAB will illuminate the ABS warning lamp.

3.3.2 DIAGNOSTIC MODE

For a Mark 20 system to enter a diagnostic mode, vehicle speed must be below 10 km/h (6 mph) and no ABS condition present. If vehicle speed is not below 10 km/h (6 mph), a “No Response” message could be displayed by the DRBIII®. The following are characteristics of diagnostic mode:

- The amber ABS warning indicator will blink rapidly (about ½ second on and ½ second off). If a hard trouble code is present, such as a CAB Power Feed Circuit diagnostic trouble code, the ABS warning indicator will be illuminated without blinking until the diagnostic trouble code condition is corrected.
- Antilock operation is disabled.

3.3.3 INTERMITTENT DIAGNOSTIC TROUBLE CODES

If the malfunction is not present while performing a test procedure, the diagnostic procedures will not locate the problem. In this case, the code can only suggest an area to inspect. Check for the following:

- mechanical interference with brake or accelerator pedal
- loose or corroded conditions
- damaged components (sensors, tone wheels, pedal drive cable)
- damaged wiring
- excessive axle shaft runout
- loose pedal mounting
- hydraulic system leaks
- regular brake system problems, non-ABS related

If no obvious problems are found, erase diagnostic trouble codes and with the key on, wiggle the wire harness and connectors. Recheck for codes periodically as you work through the system. This procedure may uncover a difficult to locate malfunction.

3.4 USING THE DRBIII®

Refer to the DRBIII® user's guide for instructions and assistance with reading diagnostic trouble codes, erasing diagnostic trouble codes and other DRBIII® functions.

3.5 DRBIII® ERROR MESSAGES

Under normal operation, the DRBIII® will display one of only two error messages:

— User-Requested WARM Boot or User-Requested COLD Boot

If the DRBIII® should display any other error message, record the entire display and call the STAR Center for information and assistance. This is a sample of such an error message display:

```
ver: 2.14
date: 26 Jul93
file: key_itf.cc
date: Jul 26 1993
line: 548
err: 0x1
User-Requested COLD Boot

Press MORE to switch between this display
   and the application screen.
Press F4 when done noting information.
```

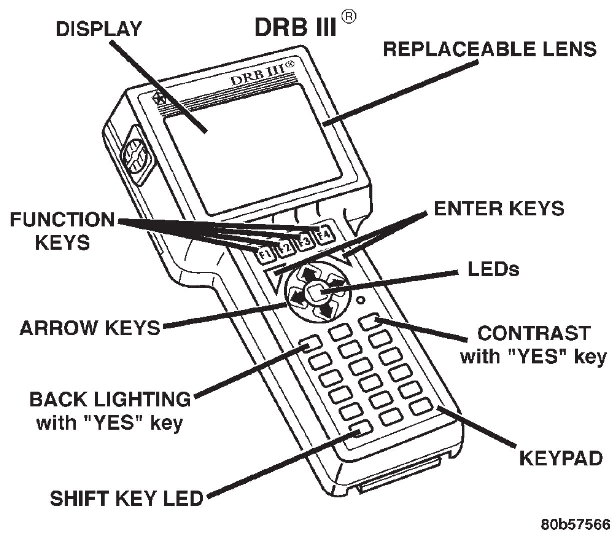
3.5.1 DRBIII® DOES NOT POWER UP (BLANK SCREEN)

If the LED's do not light or no sound is emitted at start up, check for loose cable connections or a bad cable. Check the vehicle battery voltage (data link 16-way connector cavity 16). A minimum of 11 volts is required to adequately power the DRBIII®. Also check for a good ground at the DLC.

If all connections are proper between the DRBIII® and the vehicle or other devices, and the vehicle battery is fully charged, an inoperative DRBIII® may be the result of faulty cable or vehicle wiring.

3.5.2 DISPLAY IS NOT VISIBLE

Low temperatures will affect the visibility of the display. Adjust the contrast to compensate for this condition.



4.0 DISCLAIMERS, SAFETY, WARNINGS

4.1 DISCLAIMERS

All information, illustrations, and specifications contained in this manual are based on the latest information available at the time of publication. The right is reserved to make changes at any time without notice.

4.2 SAFETY

4.2.1 TECHNICIAN SAFETY INFORMATION

WARNING: ENGINES PRODUCE CARBON MONOXIDE THAT IS ODORLESS, CAUSES SLOWER REACTION TIME, AND CAN LEAD TO SERIOUS INJURY. WHEN THE ENGINE IS OPERATING, KEEP SERVICE AREAS WELL VENTILATED OR ATTACH THE VEHICLE EXHAUST SYSTEM TO THE SHOP EXHAUST REMOVAL SYSTEM.

Set the parking brake and block the wheels before testing or repairing the vehicle. It is especially important to block the wheels on front-wheel drive vehicles; the parking brake does not hold the front drive wheels.

When servicing a vehicle, always wear eye protection, and remove any metal jewelry such as watchbands or bracelets that might make an inadvertent electrical contact.

When diagnosing an antilock brake or adjustable pedals system problem, it is important to follow approved procedures where applicable. These procedures can be found in the service manual. Following these procedures is very important to the safety of individuals diagnostic tests.

4.2.2 VEHICLE PREPARATION FOR TESTING

Make sure the vehicle being tested has a fully charged battery. If it does not, false diagnostic codes or error messages may occur.

4.2.3 SERVICING SUB-ASSEMBLIES

Some components of the antilock brake or adjustable pedals system are intended to be serviced in assembly only. Attempting to remove or repair certain sub-components may result in personal injury and/or improper system operation. Only those components with approved repair and installation procedures in the service manual should be serviced.

4.2.4 DRBIII® SAFETY INFORMATION

WARNING: EXCEEDING THE LIMITS OF THE DRBIII® MULTIMETER IS DANGEROUS. IT CAN EXPOSE YOU TO SERIOUS OR POSSIBLY FATAL INJURY. CAREFULLY READ AND UNDERSTAND THE CAUTIONS AND THE SPECIFICATIONS LIMITS.

Follow the vehicle manufacturer's service specifications at all times.

- Do not use the DRBIII® if it has been damaged.
- Do not use the test leads if insulation is damaged or if metal is exposed.
- To avoid electrical shock, do not touch the test leads, tips, or the circuit being tested.
- Choose the proper range and function for the measurement. Do not try voltage or current measurements that may exceed the rated capacity.
- Do not exceed the limits shown in the table below:

FUNCTION	INPUT LIMIT
Volts	0 - 500 peak volts AC 0 - 500 volts DC
Ohms (resistance)*	0 - 1.12 megohms
Frequency Measured Frequency Generated	0 - 10 kHz
Temperature	-58 - 1100°F -50 - 600°C

* Ohms cannot be measured if voltage is present. Ohms can be measured only in a non-powered circuit.

- Voltage between any terminal and ground must not exceed 500v DC or 500v peak AC.
- Use caution when measuring voltage above 25v DC or 25v AC.
- Use the low current shunt to measure circuits up to 10A. Use the high current clamp to measure circuits exceeding 10A.
- When testing for the presence of voltage or current, make sure the meter is functioning correctly. Take a reading of a known voltage or current before accepting a zero reading.
- When measuring current, connect the meter in series with test lead.
- When using the meter function, keep the DRBIII® away from spark plug or coil wires to avoid measuring error from outside interference.

4.3 WARNING

4.3.1 VEHICLE DAMAGE WARNINGS

Before disconnecting any control module, make sure the ignition is "off". Failure to do so could damage the module.

When testing voltage or continuity at any control module, use the terminal side (not the wire end) of the connector. Do not probe a wire through the insulation; this will damage it and eventually cause it to fail because of corrosion.

Be careful when performing electrical tests so as to prevent accidental shorting of terminals. Such mistakes can damage fuses or components. Also, a second code could be set, making diagnosis of the original problem more difficult.

4.3.2 ROAD TESTING A COMPLAINT VEHICLE

Some complaints will require a test drive as part of the repair verification procedure. The purpose of the test drive is to try to duplicate the diagnostic code or symptom condition.

CAUTION: Before road testing a vehicle, be sure that all components are reassembled. During the test drive, do not try to read the DRBIII® screen while in motion. Do not hang the DRBIII® from the rear view mirror or operate it yourself. Have an assistant available to operate the DRBIII®.

4.4 DIAGNOSIS

1. Your diagnostic test procedure must begin with a thorough visual inspection of the system in question for damaged components or disconnected connectors. For ABS, the brake lamps must be operational prior to continuing.
2. Connect the DRBIII® to the data link connector located under the dash. If the DRBIII® does not power up, check the power and ground supplies to the connector.
3. Select the system in question. Turn the ignition on. If the DRBIII® displays "No Response", refer to Communication in the Body Diagnostic Procedures manual to diagnose the symptom.
4. Read and record all diagnostic trouble codes. For ABS, if the "CAB Power Feed Circuit" diagnostic trouble code is present, it must be repaired prior to addressing any other DTC's. If any additional codes are present, proceed to the appropriate test.
5. For ABS, if there are no diagnostic trouble codes present, select "Inputs/Outputs" and read the brake switch input as your press and release the brake pedal. If the display does not match the state of the pedal, perform the proper test. For a problem with the amber "ABS" warning indicator, refer to the proper test.
6. For ABS, if no other problems are found, it will be necessary to road test the vehicle. **THE DRBIII® MUST NOT BE CONNECTED TO THE DATA LINK CONNECTOR WHEN ROAD TESTING FOR PROPER ANTILOCK OPERATION. THE SYSTEM IS DISABLED WHILE IN DIAGNOSTIC MODE.** Perform several antilock stops from above 50 Km/h (30 mph) and then repeat steps 2, 3, and 4. If any diagnostic trouble codes are present, proceed to the appropriate test.
7. For ABS, the following conditions should be considered "NORMAL" operation, and no repairs should be attempted to correct them.
   - Brake pedal feedback during an ABS stop (clicking, vibrating)
   - Clicking, groaning or buzzing at 10 Km/h (6 mph) (drive off self test)
   - Groaning noise during an ABS stop
   - Slight brake pedal drop and pop noise when ignition is initially turned on
   - Brake pedal ratcheting down at the end of an ABS stop
8. If the complaint is ABS "cycling" at the end of a stop at low speeds, it may be caused by a marginal wheel speed sensor signal. The sensor air gap, tone wheel condition, and/or brakes hanging up are possible causes of this condition.
9. After a road test in which no problems were found, refer to any Technical Service Bulletins that may apply.

5.0 REQUIRED TOOLS AND EQUIPMENT

DRBIII® (diagnostic read-out box)
jumper wires
ohmmeter
voltmeter
test light

6.0 GLOSSARY OF TERMS

ABS	antilock brake system
AC	alternating current
APM	adjustable pedals module
BCM	Body Control Module

CAB	controller antilock brake
DC	direct current
DLC	data link connector
DRB	diagnostic read-out box
DTC	diagnostic test code
EMI	electro magnetic interference
EVBP	Electronic Variable Brake Proportioning

7.0

DIAGNOSTIC INFORMATION AND PROCEDURES

Symptom:
PEDAL SENSOR OPEN/SHORTED TO BATTERY

When Monitored and Set Condition:

PEDAL SENSOR OPEN/SHORTED TO BATTERY

When Monitored: Constantly.

Set Condition: When the APM detects the voltage on the Sense circuit is too high.

POSSIBLE CAUSES
MOTOR/SENSOR SHORTED OR OPEN
SENSE CIRCUIT SHORT TO BATTERY OR TO SENSOR FEED CIRCUIT
APM-INTERNAL FAULT
INTERMITTENT DTC

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase DTC's. With the DRBIII®, read DTC's. Does the DRBIII® display PEDAL SENSOR OPEN/SHORTED TO BATTERY DTC active? Yes → Go To 2 No → Go To 4	All
2	Disconnect the Adjustable Pedals Motor/Sensor harness connector. Turn the ignition on. With the DRBIII®, read the active DTCs. Does the DRBIII® display PEDAL SENSOR OPEN/SHORTED TO BATTERY? Yes → Go To 3 No → Replace the Adjustable Pedals Motor/Sensor assembly in accordance with the Service Information. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1.	All

PEDAL SENSOR OPEN/SHORTED TO BATTERY — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Adjustable Pedals Motor/Sensor harness connector. Disconnect the Adjustable Pedals Module harness connector. **Note: Check connector - Clean/repair as necessary.** Turn the ignition on. Check the Sense circuit for a short to battery and for a short to the Sensor Feed circuit. Is the Sense circuit shorted? Yes → Repair the Sense circuit for a short to battery or to the Sensor Feed circuit. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1. No → Replace and program the Adjustable Pedals Module in accordance with the Service Information.. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1.	All
4	Turn the ignition off. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Refer to any Hotline letters or Technical Service Bulletins that may apply. Were any problems found? Yes → Repair as necessary. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
PEDAL SENSOR SHORTED TO GROUND

When Monitored and Set Condition:

PEDAL SENSOR SHORTED TO GROUND

When Monitored: Constantly

Set Condition: When the APM detects a ground condition at the Sense circuit.

POSSIBLE CAUSES
MOTOR/SENSOR ASSEMBLY SHORTED TO GROUND
APM-SENSE CIRCUIT GROUNDED
INTERMITTENT DTC

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase DTC's. With the DRBIII®, read DTC's. Does the DRBIII® display PEDAL SENSOR SHORTED TO GROUND DTC active? Yes → Go To 2 No → Go To 3	All
2	Disconnect the Adjustable Pedals Motor/Sensor harness connector. Turn the ignition on. With the DRBIII®, read the active DTCs. Does the DRBIII® display SENSOR WIRING SHORTED TO GROUND? Yes → Inspect for and correct wiring damage. If no damage is found, replace and program the Adjustable Pedals Module in accordance with the Service Information.. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1. No → Repair any Motor/Sensor assembly wiring concerns. If no wring concerns are found, replace the Adjustable Pedals Motor/Sensor assembly. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Refer to any Hotline letters or Technical Service Bulletins that may apply. Were any problems found? Yes → Repair as necessary. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
PEDAL SW STUCK FORWARD

When Monitored and Set Condition:

PEDAL SW STUCK FORWARD

When Monitored: Constantly

Set Condition: When the Adjustable Pedals module detects battery voltage on the Adjustable Pedals Switch FWD circuit for more than 20 seconds.

POSSIBLE CAUSES
ADJUSTABLE PEDALS MODULE INTERNAL FAULT
SWITCH FAILURE
INTERMITTENT DTC
FWD CIRCUIT SHORTED TO BATTERY OR TO BATTERY FEED CIRCUIT

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase DTC's. Turn the ignition on. With the DRBIII®, read DTC's. Does the DRBIII® display PEDAL SW STUCK FORWARD DTC active? Yes → Go To 2 No → Go To 4	All
2	Disconnect the Adjustable Pedals switch connector. Turn the ignition on. With the DRBIII®, read DTC's. Does the DRBIII® display PEDAL SW STUCK FORWARD DTC active? Yes → Go To 3 No → Replace the Adjustable Pedals Switch. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Disconnect the Adjustable Pedals Module harness connector. Disconnect the Adjustable Pedals switch connector. Turn the ignition ON. Check the FWD and BATTERY FEED circuits for a short to battery, to ground and to each other. Is there any circuit short? Yes → Repair the circuit short. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1. No → Replace and program the Adjustable Pedals Module in accordance with the Service Information. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1.	All

PEDAL SW STUCK FORWARD — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Refer to any Hotline letters or Technical Service Bulletins that may apply. Were any problems found? Yes → Repair as necessary. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
PEDAL SW STUCK REARWARD

When Monitored and Set Condition:

PEDAL SW STUCK REARWARD

When Monitored: Constantly

Set Condition: When the Adjustable Pedals module detects battery voltage on the Adjustable Pedals Switch AFT circuit for more than 20 seconds.

POSSIBLE CAUSES
ADJUSTABLE PEDALS MODULE INTERNAL FAULT
SWITCH FAILURE
INTERMITTENT DTC
AFT CIRCUIT SHORTED TO BATTERY OR TO BATTERY FEED CIRCUIT

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase DTC's. Turn the ignition on. With the DRBIII®, read DTC's. Does the DRBIII® display PEDAL SW STUCK REARWARD DTC active? Yes → Go To 2 No → Go To 4	All
2	Disconnect the Adjustable Pedals switch connector. Turn the ignition on. With the DRBIII®, read DTC's. Does the DRBIII® display PEDAL SW STUCK REARWARD DTC active? Yes → Go To 3 No → Replace the Adjustable Pedals Switch. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Disconnect the Adjustable Pedals Module harness connector. Disconnect the Adjustable Pedals switch connector. Turn the ignition ON. Check the AFT and BATTERY FEED circuits for a short to battery, to ground and to each other. Is there any circuit short? Yes → Repair the circuit short. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1. No → Replace and program the Adjustable Pedals Module in accordance with the Service Information. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1.	All

PEDAL SW STUCK REARWARD — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Refer to any Hotline letters or Technical Service Bulletins that may apply. Were any problems found? Yes → Repair as necessary. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
SYSTEM OVER VOLTAGE

When Monitored and Set Condition:

SYSTEM OVER VOLTAGE

When Monitored: Whenever the module is awake

Set Condition: When the APM detects 3 consecutive J1850 Bus messages indicating vehicle voltage over 15.94 VDC.

POSSIBLE CAUSES
VEHICLE VOLTAGE HIGH
APM -- INTERNAL FAILURE

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, read the vehicle voltage status. Does the DRBIII® display a high voltage concern? Yes → Refer to Charging information for the related symptom(s). Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1. No → Replace and program the Adjustable Pedals Module in accordance with the Service Information. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1.	All

Symptom:
SYSTEM UNDER VOLTAGE

When Monitored and Set Condition:

SYSTEM UNDER VOLTAGE

When Monitored: Any time that the module is awake.

Set Condition: When the APM detects 3 consecutive J1850 Vehicle Battery Voltage messages indicating a battery voltage less than 9 VDC.

POSSIBLE CAUSES
VEHICLE VOLTAGE LOW
APM -- INTERNAL FAILURE

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, read the vehicle voltage status. Does the DRBIII® display a low voltage concern? Yes → Refer to Charging information for the related symptom(s). Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1. No → Replace and program the Adjustable Pedals Module in accordance with the Service Information. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1.	All

Symptom:
*CAN'T ADJUST PEDALS

POSSIBLE CAUSES
VEHICLE IN CRUISE OR REVERSE
DTC OR IN-PLANT MODE ACTIVE
MOTOR/SENSOR ASSEMBLY
MOTOR FWD OR AFT CIRCUIT SHORTED OR OPEN
BATTERY FEED CIRCUIT OPEN
ADJUSTABLE PEDALS MODULE INTERNAL FAULT
ADJ PEDAL SW OPEN

TEST	ACTION	APPLICABILITY
1	**NOTE: Adjustable Pedals are disabled when the vehicle is in Reverse or when the Speed Control is activated.** Check whether vehicle is in Reverse and whether Speed Control is activated. Is the vehicle in Reverse or is Speed Control activated. Yes → Correct as necessary. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1. No → Go To 2	All
2	With the DRBIII®, erase DTC's. With the DRBIII®, read DTC's. With the DRBIII® in Inputs/Outputs, read the In-Plant mode state. Are any DTCs active or is the APM in the In-Plant mode? Yes → Refer to symptom list for problems related to the active DTC or disable In-Plant test mode. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the Adjustable Pedals Module harness connector. Connect a jumper wire between the Battery Feed circuit and ground. Operate the Adjustable Pedals Switch to the Aft and Fwd positions. Using a 12-volt test light connected to 12-volts, check the Aft and Fwd circuits. Does the test light illuminate brightly in each switch position? Yes → Go To 4 No → Go To 6	All

*CAN'T ADJUST PEDALS — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the Adjustable Pedals Motor/Sensor harness connector. Operate the Adjustable Pedals Switch to the Fwd position. On the APM side of the connector, using a 12-volt test light connected to ground, check the Fwd circuit. On the APM side of the connector, using a 12-volt test light connected to 12-volts, check the Aft circuit. Does the test light illuminate brightly at each pin? Yes → Repair any wiring concerns. If no concerns are found, replace the Adjustable Pedals Motor/Sensor assembly. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Disconnect the Adjustable Pedals Module harness connector. Disconnect the Adjustable Pedals Motor/Sensor connector. Check the FWD and AFT circuits for short to battery, to ground, to each other and for an open. Is the FWD or AFT circuit shorted or open? Yes → Repair the Adjustable Pedals Motor FWD or AFT circuit short or open as necessary. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1. No → Replace and program the Adjustable Pedals Module in accordance with the Service Information. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. Disconnect the Adjustable Pedals Module harness connector. Disconnect the Adjustable Pedals switch connector. Measure the resistance of the Battery Feed circuit. Is the resistance above 5.0 ohms? Yes → Repair the Battery Feed circuit for an open. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1. No → Replace the Adjustable Pedals Switch. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1.	All

Symptom:
*CAN'T SET/RECALL MEMORY POSITIONS

POSSIBLE CAUSES
DTC OR IN-PLANT MODE ACTIVE
DRIVER DOOR MODULE -- INTERNAL FAULT
ADJUSTABLE PEDALS MODULE FAULT

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, erase DTCs. With the DRBIII®, read the active DTCs. With the DRBIII® in Inputs/Outputs, read the In-Plant state. Any active DTCs or is In-Plant mode activated Yes → Disable the In-Plant mode or refer to symptom list for problems related to the active DTC. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1. No → Go To 2	All
2	Attempt to set and recall other memory functions in the vehicle. Can other vehicle memory functions be set and recalled OK? Yes → Replace the Adjustable Pedals Module in accordance with the Service Information. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1. No → Replace and program the Driver Door Module in accordance with the Service Information. Perform ADJUSTABLE PEDALS VERIFICATION TEST - VER 1.	All

Symptom:
BRAKE FLUID LEVEL SWITCH

When Monitored and Set Condition:

BRAKE FLUID LEVEL SWITCH

When Monitored: Ignition on, every 7 milliseconds (ms).

Set Condition: The DTC will be set when the Brake Fluid Level Switch Sense circuit is shorted to ground (below approximately 1 volt for 70 milliseconds) or is open or shorted to voltage (above 4 volts for 70 milliseconds).

POSSIBLE CAUSES
LOW FLUID LEVEL OR SWITCH DISCONNECTED
BRAKE FLUID LEVEL SWITCH RESISTANCE OUT OF SPECIFICATION
BRAKE FLUID LEVEL SWITCH SENSE CIRCUIT SHORTED TO BATTERY
BRAKE FLUID LEVEL SWITCH SENSE OR GROUND CIRCUIT OPEN
CAB - SENSE CIRCUIT OPEN
BRAKE FLUID LEVEL SWITCH SENSE CIRCUIT SHORTED TO GROUND
BRAKE FLUID LEVEL SWITCH SENSE AND GROUND CIRCUITS SHORTED TOGETHER
CAB-INTERNAL SHORT
INTERMITTENT DTC

TEST	ACTION	APPLICABILITY
1	Inspect the Brake Fluid Level in the Master Cylinder Reservoir. Check connection to Brake Fluid Level Switch. Is the Brake Fluid Level Low or the Switch disconnected? Yes → Fill the brake fluid reservoir or reconnect as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the Brake Fluid Level Switch connector. **Note: Check connector - Clean/repair as necessary.** Measure resistance of the Brake Fluid Level Switch. Is the resistance between 990 and 1010 ohms? Yes → Go To 3 No → Replace Brake Fluid Level Switch. Perform ABS VERIFICATION TEST - VER 1.	All

BRAKE FLUID LEVEL SWITCH — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition on. With the DRBIII®, read Brake Fluid Level Switch voltage. What is the Voltage reading of the Brake Fluid Level Switch? Approximately 2 volts. Go To 4 Above 4 volts. Go To 5 Approximately 0 volts. Go To 8	All
4	Turn the ignition off. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Refer to any Hotline letters or Technical Service Bulletins that may apply. Were any problems found? Yes → Repair wiring harness/connectors as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Test Complete.	All
5	Turn the ignition off. Disconnect the Brake Fluid Level Switch connector. **Note: Check connector - Clean/repair as necessary.** Disconnect the CAB harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, check the Fluid Level Sense circuit. Does the test light illuminate? Yes → Repair the Brake Fluid Level Switch Sense circuit for a short to voltage. Perform ABS VERIFICATION TEST - VER 1. No → Go To 6	All
6	Turn the ignition off. Disconnect the Brake Fluid Level Switch connector. **Check connector - Clean/repair as necessary.** Disconnect the CAB connector. **Check connector - Clean/repair as necessary.** Measure the resistance of the Brake Fluid Level Switch Sense and Ground circuits. Is the resistance below 5 ohms for both circuits? Yes → Go To 7 No → Repair the Brake Fluid Level Switch Sense or Ground circuit for an open. Perform ABS VERIFICATION TEST - VER 1.	All
7	If there are no possible causes remaining, view repair. Repair Replace the CAB. Perform ABS VERIFICATION TEST - VER 1.	All

BRAKE FLUID LEVEL SWITCH — Continued

TEST	ACTION	APPLICABILITY
8	Turn the ignition off. Disconnect the Brake Fluid Level Switch connector **Note: Check connector - Clean/repair as necessary.** Disconnect the CAB connector. **Check connector - Clean/repair as necessary.** Turn the ignition on. Using a 12-volt test light connected to ground, check the Brake Fluid Level Switch Sense circuit. Is the test light on? Yes → Repair Brake Fluid Level Switch Sense Circuit for a Short to Ground. Perform ABS VERIFICATION TEST - VER 1. No → Go To 9	All
9	Turn the ignition off. Disconnect the Brake Fluid Level Switch connector **Note: Check connector - Clean/repair as necessary.** Disconnect the CAB connector. **Check connector - Clean/repair as necessary.** Measure the resistance between the Brake Fluid Level Switch Sense and Ground circuits. Is the resistance below 5.0 ohms? Yes → Repair Brake Fluid Level Switch Sense and Ground circuits shorted together. Perform ABS VERIFICATION TEST - VER 1. No → Go To 10	All
10	If there are no possible causes remaining, view repair. Repair Replace the CAB. Perform ABS VERIFICATION TEST - VER 1.	All

Symptom:
CAB POWER FEED CIRCUIT

When Monitored and Set Condition:

CAB POWER FEED CIRCUIT

When Monitored: Ignition on. The CAB monitors the Fused B(+) circuit at all times for proper system voltage.

Set Condition: If the Fused B(+) voltage is missing when the CAB detects that an internal main driver is not ″on″, the Diagnostic Trouble Code (DTC) is set.

POSSIBLE CAUSES
INTERMITTENT DTC
BLOWN FUSE - FUSED B(+) CIRCUIT
NO B+ SUPPLY TO FUSE
FUSED B(+) CIRCUIT OPEN
B(+) CIRCUIT INTERMITTENTLY SHORTED TO GROUND
B(+) CIRCUIT SHORTED TO GROUND
CAB - FUSED B(+) CIRCUIT OPEN
CAB - FUSED B(+) CIRCUIT SHORTED TO GROUND

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, erase DTC's. Turn the ignition off. Turn the ignition on. Drive the vehicle above 25 km/h (15 mph) for at least 10 seconds. Stop the vehicle. With the DRBIII®, read DTC's. Does the DRBIII® display CAB Power Feed Circuit DTC present right now? Yes → Go To 2 No → Go To 10	All
2	Turn the ignition off. Remove and Inspect the ABS Fuse 19 in the Junction Block. Is the Fuse blown? Yes → Go To 3 No → Go To 7	All

CAB POWER FEED CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Visually inspect the B(+) Circuit in the wiring harness from the Junction Block to the CAB. Look for any sign of an intermittent short to ground. Is the wiring harness OK? Yes → Go To 4 No → Repair the Fused B(+) Circuit Shorted to Ground. Perform ABS VERIFICATION TEST - VER 1.	All
4	Turn the ignition off. Remove the ABS Fuse 19 from the Junction Block. Disconnect the CAB harness connector. **Note: Check connector - Clean/repair as necessary.** Using a test light connected to 12 volts, probe the Fused B(+) Circuit. Is the test light on? Yes → Repair the Fused B(+) Circuit Shorted to Ground. Perform ABS VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off. Remove the ABS Fuse 19 from the Junction Block. The CAB must be connected for the results of this test to be valid. Using a test light connected to 12 volts, probe the Fused B(+) Circuit at the Junction Block fuse terminal. Is the test light on? Yes → Replace the CAB. Perform ABS VERIFICATION TEST - VER 1. No → Go To 6	All
6	Turn the ignition off. If there are no potential causes remaining, view repair. Continue Replace the Fuse. Perform ABS VERIFICATION TEST - VER 1.	All
7	Remove the ABS Fuse 19 from the Junction Block. Turn the ignition on. Measure the voltage of the Fused B+ supply to Fuse 19 in the Junction Block. Is the voltage above 10 volts? Yes → Go To 8 No → Repair the B+ Supply circuit for an open. Perform ABS VERIFICATION TEST - VER 1.	All
8	Turn the ignition off. Remove the ABS Fuse 19 from the Junction Block. Disconnect the CAB harness connector. **Note: Check connector - Clean/repair as necessary.** Measure the resistance of the Fused B(+) circuit between the Junction Block Fuse terminal 19 and the CAB connector. Is the resistance below 5 ohms? Yes → Go To 9 No → Repair Fused B(+) Circuit Open. Perform ABS VERIFICATION TEST - VER 1.	All

CAB POWER FEED CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
9	If there are no potential causes remaining, view repair. Repair Replace the CAB. Perform ABS VERIFICATION TEST - VER 1.	All
10	Turn the ignition off. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Refer to any Hotline letters or Technical Service Bulletins that may apply. Were any problems found? Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
CLUSTER FAULT

When Monitored and Set Condition:

CLUSTER FAULT

When Monitored: Ignition on, every time a message is sent from the instrument cluster.

Set Condition: When the message from the instrument cluster, via the PCI Bus, informs the CAB that it cannot turn on the ABS Warning Indicator or the Red Baake Warning Indicator.

POSSIBLE CAUSES
CLUSTER FAULT DTC CONDITION PRESENT
CAB-- INTERNAL FAULT
INTERMITTENT DTC

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's in the Instrument Cluster, not the CAB module. Are any ABS or brake system-related DTCs present? Yes → Refer to the Cluster category for the related symptom(s). Perform ABS VERIFICATION TEST - VER 1. No → Go To 2	All
2	With the DRB, erase DTC's. Turn the ignition on and wait approximately 1 minute. With the DRB, read DTC's. Did this DTC reset? Yes → Replace the Controller Anti-Lock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Refer to any Hotline letters or Technical Service Bulletins that may apply. Were any problems found? Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
CONTROLLER FAILURE

When Monitored and Set Condition:

CONTROLLER FAILURE

When Monitored: Ignition on. The CAB monitors its internal microprocessors for correct operation.

Set Condition: If the CAB detects an internal fault, the DTC is set.

POSSIBLE CAUSES
GROUND AND POWER CONNECTIONS
GROUND CIRCUIT HIGH RESISTANCE
GROUND CIRCUIT INTERFERENCE
CAB - INTERNAL FAILURE

TEST	ACTION	APPLICABILITY
1	Inspect for non-factory wiring that may interfere with CAB power or ground circuits. Disconnect the CAB harness connector. Inspect the CAB wiring harness for incorrect routing and damage. Inspect the CAB harness and component connectors for corrosion and damage. Were any concerns found? Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the CAB harness connector. **Note: Check connector - Clean/repair as necessary.** Measure the resistance of the CAB ground circuits to body ground. Is the resistance below 1.0 ohm? Yes → Go To 3 No → Repair the Ground circuit high resistance. Perform ABS VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Disconnect the CAB harness connector. **Note: Check connector - Clean/repair as necessary.** Turn the ignition on. Turn on all accessories. Measure the voltage of the Ground circuit. Is the voltage below 1.0 volts? Yes → Go To 4 No → Repair as necessary. Unsplice any accessories connected to the CAB ground circuit. Reroute and shield any high voltage cables away from the CAB ground circuit. Perform ABS VERIFICATION TEST - VER 1.	All

CONTROLLER FAILURE — Continued

TEST	ACTION	APPLICABILITY
4	If there are no possible causes remaining, view repair. Repair Replace the CAB. Perform ABS VERIFICATION TEST - VER 1.	All

Symptom:
G-SWITCH NOT PROCESSABLE

When Monitored and Set Condition:

G-SWITCH NOT PROCESSABLE

When Monitored: Ignition on. The CAB sends a test signal to its internal G-Sensor and monitors the internal sense circuits.

Set Condition: If the sense circuits are shorted or open for 2 minutes while driving or an otherwise improper signal is detected at any time, the Diagnostic Trouble Code (DTC) is set.

POSSIBLE CAUSES
CAB - INTERNAL FAILURE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, record and erase DTC's. With the DRBIII®, read DTCs. Does the DRBIII® display G-SWITCH NOT PROCESSABLE? Yes → Replace the CAB. Perform ABS VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
LEFT FRONT SENSOR CIRCUIT FAILURE

When Monitored and Set Condition:

LEFT FRONT SENSOR CIRCUIT FAILURE

When Monitored: Ignition on. The CAB monitors the wheel speed circuit every 7 milliseconds (ms).

Set Condition: If the CAB detects an open or shorted wheel speed sensor circuit, the Diagnostic Trouble Code (DTC) will set.

POSSIBLE CAUSES
LEFT FRONT WHEEL SPEED SENSOR OR CONNECTOR DAMAGE
LEFT FRONT WHEEL SPEED SENSOR CIRCUITS SHORTED OR OPEN
CAB--NO OUTPUT
INTERMITTENT CIRCUIT DTC
LEFT FRONT WHEEL SPEED SENSOR -- NO OUTPUT
CAB - UNABLE TO READ LEFT FRONT WHEEL SPEED SENSOR SIGNAL

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, record and erase DTC's. Turn the ignition off. Turn the ignition on. With the DRBIII®, read DTC's. Does the DRBIII® display "Left Front Wheel Speed Sensor Circuit Failure" DTC present right now? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition off. Inspect the Left Front Wheel Speed Sensor and Connector. Is the Sensor or Connector Damaged? Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Go To 3	All

LEFT FRONT SENSOR CIRCUIT FAILURE — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Left Front Wheel Speed Sensor connector. **Note: Check connector - Clean/repair as necessary.** Disconnect the CAB connector. **Note: Check connector - Clean/repair as necessary.** Turn the ignition on. Check the Left Front Wheel Speed Sensor 12 volt Supply and Signal circuits for a short to battery, ground, to each other and for open. For the purposes of this test, a short to ground must be below 15k ohms. Was any circuit short or open found? Yes → Repair Left Front Wheel Speed Sensor circuit short or open. Perform ABS VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn ignition off. Make sure the CAB is not disconnected. Disconnect the Left Front Wheel Speed Sensor connector. **Note: Check connector - Clean/repair as necessary.** Turn ignition on. Measure the voltage across the Left Front Wheel Speed Sensor 12 Volt Supply and Signal circuits at the Left Front Wheel Speed Sensor connector. Is the voltage above 10 volts? Yes → Go To 5 No → Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.	All
5	Turn ignition off. Disconnect the CAB harness connector. Remove the harness strain relief to access the wires in the CAB connector. Using a DC voltmeter and special tool 6801, backprobe the Wheel Speed Sensor 12 volt Supply and Signal circuits at the CAB. Reconnect the CAB. Turn ignition on. Slowly rotate the left front wheel while observing voltmeter reading. Does the voltage change from approximately 1.6 volts to 0.8 volts as the wheel is rotated? Yes → Replace the CAB. Perform ABS VERIFICATION TEST - VER 1. No → Replace the Left Front Wheel Speed Sensor. Perform ABS VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Refer to any Hotline letters or Technical Service Bulletins that may apply. Were any problems found? Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
LEFT FRONT SENSOR SIGNAL FAILURE

When Monitored and Set Condition:

LEFT FRONT SENSOR SIGNAL FAILURE

When Monitored: Wheel speed comparison is checked at drive off or every 7 milliseconds (ms). Sensor circuit continuity is checked every 7 milliseconds. Wheel speed phase length supervision is checked every 7 milliseconds.

Set Condition: If, during an ABS stop, the CAB commands any valve solenoid on for an extended length of time, and does not see a corresponding wheel speed change, the Diagnostic Trouble Code (DTC) is set. The DTC can also set if the signal is missing or erratic.

POSSIBLE CAUSES
LEFT FRONT WHEEL SPEED SENSOR OR CONNECTOR DAMAGED
TONE WHEEL DAMAGED
LEFT FRONT WHEEL SPEED SENSOR AIR GAP OUT OF SPECIFICATION
LEFT FRONT WHEEL BEARING OUT OF SPECIFICATION
LEFT FRONT WHEEL SPEED SENSOR INOPERATIVE
CAB - WON'T RESPOND TO LEFT FRONT WHEEL SPEED SENSOR SIGNAL
INTERMITTENT SIGNAL DTC

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. Using the DRBIII®, monitor the Left Front Wheel Speed Sensor while an assistant drives the vehicle. With an assistant to drive, use the DRBIII® to monitor all wheel speed sensors. Slowly accelerate as straight as possible from a stop to 24 km/h (15 mph). Is Left Front WSS Signal 0 km/h (0 mph) or differing from others by more than 5 km/h (3 mph)? Yes → Go To 2 No → Go To 7	All
2	Turn the ignition off. Inspect the Left Front Wheel Speed Sensor and Connector. Is the Sensor or Connector Damaged? Yes → Repair as necessary. The CAB must sense all four wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator. Perform ABS VERIFICATION TEST - VER 1. No → Go To 3	All

LEFT FRONT SENSOR SIGNAL FAILURE — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Inspect the Tone Wheel for damaged or missing teeth, cracks, or looseness. **Note: The Tone Wheel Teeth should be perfectly square, not bent or nicked.** Is the Tone Wheel OK? Yes → Go To 4 No → Replace the Tone Wheel. The CAB must sense all four wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator. Perform ABS VERIFICATION TEST - VER 1.	All
4	Turn the ignition off. Using a Feeler Gauge, measure the Wheel Speed Sensor Air Gap. **NOTE: The Air Gap should be checked in at least four places on the Tone Wheel.** Is the Air Gap between 0.42 mm - 1.71 mm (0.017″ - 0.068″) ? Yes → Go To 5 No → Repair as necessary. The CAB must sense all four wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator. Perform ABS VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Inspect the wheel bearings for excessive runout or clearance. **Note: Refer to the appropriate service information, if necessary, for procedures or specifications.** Is the bearing clearance OK ? Yes → Go To 6 No → Repair as necessary. The CAB must sense all four wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator. Perform ABS VERIFICATION TEST - VER 1.	All
6	Turn ignition off. Disconnect the CAB harness connector. Remove the harness strain relief to access the wires in the CAB connector. Using a DC voltmeter and special tool 6801, backprobe the Wheel Speed Sensor 12 volt Supply and Signal circuits at the CAB. Reconnect the CAB. Turn the ignition on. Slowly rotate the left front wheel while observing voltmeter reading. Does the voltage change from approximately 1.6 volts to 0.8 volts as the wheel is rotated? Yes → Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1. No → Replace the Left Front Wheel Speed Sensor in accordance with the Service Information. The CAB must sense all four wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator. Perform ABS VERIFICATION TEST - VER 1.	All

LEFT FRONT SENSOR SIGNAL FAILURE — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off. Visually inspect wheel speed sensor. Visually inspect tone wheel. Visually inspect wiring harness. Visually inspect brakes for locking up due to lining contamination or overheating. Inspect all Components for defects which may cause a Signal DTC to set. Is any Component Damaged? Yes → Repair as necessary. The CAB must sense all four wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator. Perform ABS VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
LEFT REAR SENSOR CIRCUIT FAILURE

When Monitored and Set Condition:

LEFT REAR SENSOR CIRCUIT FAILURE

When Monitored: Ignition on. The CAB monitors the wheel speed circuit every 7 milliseconds (ms).

Set Condition: If the CAB detects an open or shorted wheel speed sensor circuit, the Diagnostic Trouble Code (DTC) will set.

POSSIBLE CAUSES
LEFT REAR WHEEL SPEED SENSOR OR CONNECTOR DAMAGE
LEFT REAR WHEEL SPEED SENSOR CIRCUITS SHORTED OR OPEN
CAB-NO OUTPUT
LEFT REAR WHEEL SPEED SENSOR -- NO OUTPUT
CAB - UNABLE TO READ LEFT REAR WHEEL SPEED SENSOR SIGNAL
INTERMITTENT CIRCUIT DTC

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, record and erase DTC's. Turn the ignition off. Turn the ignition on. With the DRBIII®, read DTC's. Does the DRBIII® display Left Rear Wheel Speed Sensor Circuit Failure DTC present right now? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition off. Inspect the Left Rear Wheel Speed Sensor and Connector. Is the Sensor or Connector Damaged? Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Go To 3	All

LEFT REAR SENSOR CIRCUIT FAILURE — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Left Rear Wheel Speed Sensor connector. **Note: Check connector - Clean/repair as necessary.** Disconnect the CAB connector. **Note: Check connector - Clean/repair as necessary.** Turn the ignition on. Check the Left Rear Wheel Speed Sensor 12 volt Supply and Signal circuits for a short to battery, ground, to each other and for open. For the purposes of this test, a short to ground must be below 15k ohms. Was any circuit short or open found? Yes → Repair Left Rear Wheel Speed Sensor circuit short or open. Perform ABS VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn ignition off. Disconnect the Left Rear Wheel Speed Sensor connector. Turn ignition on. Measure the voltage across the Left Rear Wheel Speed Sensor 12 Volt Supply and Signal circuits at the Left Rear Wheel Speed Sensor connector. Is the voltage above 10 volts? Yes → Go To 5 No → Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.	All
5	Turn ignition off. Disconnect the CAB harness connector. Remove the harness strain relief to access the wires in the CAB connector. Using a DC voltmeter and special tool 6801, backprobe the Wheel Speed Sensor 12 volt Supply and Signal circuits at the CAB. Reconnect the CAB. Turn ignition on. Slowly rotate the left rear wheel while observing voltmeter reading. Does the voltage change from approximately 1.6 volts to 0.8 volts as the wheel is rotated? Yes → Replace the Controller Anti-Lock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1. No → Replace the Left Rear Wheel Speed Sensor. Perform ABS VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Refer to any Hotline letters or Technical Service Bulletins that may apply. Were any problems found? Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
LEFT REAR SENSOR SIGNAL FAILURE

When Monitored and Set Condition:

LEFT REAR SENSOR SIGNAL FAILURE

When Monitored: Wheel speed comparison is checked at drive off or every 7 milliseconds (ms). Wheel speed circuit continuity is checked every 7 milliseconds. Wheel speed phase length supervision is checked every 7 milliseconds.

Set Condition: If, during an ABS stop, the CAB commands any valve solenoid on for an extended length of time, and does not see a corresponding wheel speed change, the Diagnostic Trouble Code (DTC) is set. The DTC can also set if the signal is missing or erratic.

POSSIBLE CAUSES
LEFT REAR WHEEL SPEED SENSOR OR CONNECTOR DAMAGED
TONE WHEEL DAMAGED
LEFT REAR WHEEL SPEED SENSOR AIR GAP OUT OF SPECIFICATION
WHEEL BEARINGS OUT OF SPECIFICATION
LEFT REAR WHEEL SPEED SENSOR INOPERATIVE
CAB - WON'T RESPOND TO WHEEL SPEED SENSOR SIGNAL
INTERMITTENT SIGNAL DTC

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. While an assistant drives, use the DRBIII® to monitor all Wheel Speed Sensors. Slowly accelerate as straight as possible from a stop to 24 Km/h (15 Mph). With the DRBIII®, monitor all wheel speed sensors. Is Left Rear WSS Signal 0 km/h (0 mph) or differing from others by more than 5 km/h (3 mph)? Yes → Go To 2 No → Go To 7	All
2	Turn the ignition off. Inspect the Left Rear Wheel Speed Sensor and Connector. Is the Sensor or Connector damaged? Yes → Repair as necessary. The CAB must sense all four wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator. Perform ABS VERIFICATION TEST - VER 1. No → Go To 3	All

LEFT REAR SENSOR SIGNAL FAILURE — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Inspect the Tone Wheel for damaged or missing teeth, cracks, or looseness. **Note: The Tone Wheel Teeth should be perfectly square, not bent or nicked.** Is the Tone Wheel OK? Yes → Go To 4 No → Replace the Tone Wheel. The CAB must sense all four wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator. Perform ABS VERIFICATION TEST - VER 1.	All
4	Turn the ignition off. Using a Feeler Gauge, measure the Wheel Speed Sensor Air Gap. **NOTE: The Air Gap should be checked in at least four places on the Tone Wheel.** Is the Air Gap between 0.42 mm - 1.71 mm (0.017″ - 0.068″) ? Yes → Go To 5 No → Repair as necessary. The CAB must sense all four wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator. Perform ABS VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Inspect the wheel bearings at the affected wheel for excessive runout or clearance. **Note: Refer to the appropriate service information, if necessary, for procedures or specifications.** Is the bearing clearance OK ? Yes → Go To 6 No → Repair as necessary. The CAB must sense all four wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator. Perform ABS VERIFICATION TEST - VER 1.	All
6	Turn ignition off. Disconnect the CAB harness connector. Remove the harness strain relief to access the wires in the CAB connector. With a voltmeter and special tool 6801, backprobe the Wheel Speed Sensor 12 volt Supply and Signal circuits for the affected wheel at the CAB. Reconnect the CAB. Turn the ignition on. Slowly rotate the left rear wheel while observing the voltmeter reading. Does the voltage change from approximately 1.6 volts to 0.8 volts as the wheel is rotated? Yes → Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1. No → Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information. The CAB must sense all four wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator. Perform ABS VERIFICATION TEST - VER 1.	All

LEFT REAR SENSOR SIGNAL FAILURE — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off. Visually inspect wheel speed sensor. Visually inspect tone wheel. Visually inspect wiring harness. Visually inspect brakes for locking up due to lining contamination or overheating. Inspect all Components for defects which may cause a Signal DTC to set. Is any Component Damaged? Yes → Repair as necessary. The CAB must sense all four wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator. Perform ABS VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
PCI BUS COMMUNICATION

When Monitored and Set Condition:

PCI BUS COMMUNICATION

When Monitored: Ignition ON, every 7 ms.

Set Condition: When the CAB does not receive a message from the instrument cluster for 10 seconds.

POSSIBLE CAUSES
CHECK COMMUNICATION TO MIC
CAB-- INTERNAL FAULT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, attempt to communicate with the MIC Was the DRB able to I/D or communicate with the MIC? Yes → Go To 2 No → Refer to the Communication category and perform the symptom Bus +/- Signals Open from the Controller Anti-Lock Brake. Perform ABS VERIFICATION TEST - VER 1.	All
2	With the DRB, erase DTC's. Turn the ignition on and wait approximately 1 minute. With the DRB, read DTC's. Did this DTC reappear? Yes → Replace the Controller Anti-Lock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
PUMP MOTOR CIRCUIT NOT WORKING PROPERLY

When Monitored and Set Condition:

PUMP MOTOR CIRCUIT NOT WORKING PROPERLY

When Monitored: Ignition on. The CAB commands the pump on at 20 km/h (12 mph) to check its operation, if the brake switch is not applied. If the brake is applied, the test will run at 40 km/h (25 mph). The CAB monitors pump voltage every 7 milliseconds.

Set Condition: The DTC is stored when the CAB detects: 1) Improper voltage decay after the pump was turned off. 2) Pump not energized by the CAB, but voltage is present for 3.5 seconds. 3) Pump is turned on by the CAB, but without sufficient voltage to operate it.

POSSIBLE CAUSES
CAB - PUMP MOTOR RUNNING CONTINUOUSLY
ABS PUMP MOTOR INTERMITTENT DTC
FUSED B(+) CIRCUIT INTERMITTENTLY SHORTED TO GROUND
FUSED B(+) CIRCUIT SHORTED TO GROUND
CAB - FUSED B(+) CIRCUIT SHORTED TO GROUND
FUSE BLOWN - PUMP MOTOR CIRCUIT
NO B+ SUPPLY TO FUSE
ABS PUMP MOTOR INOPERATIVE
FUSED B(+) CIRCUIT OPEN
GROUND CIRCUIT OPEN
GROUND CIRCUIT HIGH RESISTANCE
CAB - INTERNAL FAULT

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Reconnect all connectors. Turn the ignition on. Monitor the pump motor for continuous operation. Is the pump motor running continuously? Yes → Replace the Controller Anti-Lock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1. No → Go To 2	All

PUMP MOTOR CIRCUIT NOT WORKING PROPERLY — Continued

TEST	ACTION	APPLICABILITY
2	Turn the ignition on. With the DRBIII®, read DTC's. With the DRBIII®, erase DTC's. Turn the ignition off. Turn the ignition on. With the DRBIII®, actuate the ABS pump motor. Did the Pump Motor operate when actuated? No → Go To 3 Yes → Go To 14	All
3	Turn the ignition off. Remove and inspect the ABS Pump fuse #4 in the PDC. Is the Fuse blown? Yes → Go To 4 No → Go To 8	All
4	Turn the ignition off. Make sure the Pump Motor connector is secure. Visually inspect the Fused B(+) Circuit in the wiring harness from the PDC to the CAB. Look for any sign of an Intermittent Short to Ground. Is the wiring harness OK? Yes → Go To 5 No → Repair the Fused B(+) Circuit shorted to ground. The CAB must sense all four wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator. Perform ABS VERIFICATION TEST - VER 1.	All
5	Turn the ignition off. Remove the ABS PUMP Fuse # 4 from the Power Distribution Center (PDC). Disconnect the CAB connector. Make sure the Pump Motor connector is secure. **Note: Check connector - Clean/repair as necessary.** Using a test light connected to 12 volts, probe the Fused B (+) Circuit. Is the test light on? Yes → Repair the Fused B(+) circuit short to ground. The CAB must sense all four wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator. Perform ABS VERIFICATION TEST - VER 1. No → Go To 6	All
6	Turn the ignition off. Make sure the Pump Motor connector is secure. Remove the ABS PUMP Fuse 4 from the PDC. The CAB must be connected for the results of this test to be valid. Using a test light connected to 12 volts, probe the Fused B (+) circuit in the PDC. Is the test light on? Yes → Replace the Controller Anti-Lock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1. No → Go To 7	All

PUMP MOTOR CIRCUIT NOT WORKING PROPERLY — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off. Make sure the Pump Motor connector is secure If there are no potential causes remaining, replace the Fuse. If there are no possible causes remaining, view repair. Repair Replace the ABS Pump Motor Fuse. The CAB must sense all four wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator. Perform ABS VERIFICATION TEST - VER 1.	All
8	Turn the ignition off. Remove the ABS PUMP Fuse #4 from the Power Distribution Center (PDC). Disconnect the CAB connector. **Note: Check connector - Clean/repair as necessary.** Measure the resistance of the Fused B (+) circuit between the PDC Fuse Terminal and the CAB connector. Is the resistance below 10 ohms? Yes → Go To 9 No → Repair the Fused B(+) circuit for an open. Make sure the Pump Motor connector is secure. The CAB must sense all four wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator. Perform ABS VERIFICATION TEST - VER 1.	All
9	Turn the ignition on. Using a 12-volt test light connected to ground, check the B+ supply to Fuse 4 in the PDC. Is the B+ supply OK? Yes → Go To 10 No → Repair the B+ supply for an open. Make sure the Pump Motor connector is secure. The CAB must sense all four wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator. Perform ABS VERIFICATION TEST - VER 1.	All
10	Turn the ignition off. Disconnect Pump Motor Connector. Connect a 10 gauge jumper wire between pump motor Fused B (+) circuit and a 40 Amp Fused B (+) circuit. Connect a 10 gauge jumper wire between pump motor ground circuit and a known good body ground. Monitor Pump Motor operation. Is the pump motor running? Yes → Go To 11 No → Replace the ABS Pump Motor/Hydraulic Control Unit assembly. Make sure the Pump Motor connector is secure. The CAB must sense all four wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator. Perform ABS VERIFICATION TEST - VER 1.	All

PUMP MOTOR CIRCUIT NOT WORKING PROPERLY — Continued

TEST	ACTION	APPLICABILITY
11	Turn the ignition off. Disconnect CAB Connector. **Note: Check connector - Clean/repair as necessary.** Measure the resistance of the CAB ground circuits. Is the resistance below 1.0 ohm? Yes → Go To 12 No → Repair the ground circuit for an open. Make sure the Pump Motor connector is secure. The CAB must sense all four wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator. Perform ABS VERIFICATION TEST - VER 1.	All
12	Make sure the Pump Motor connector is secure. Turn the ignition on. With the DRBIII®, enable pump motor actuation. **NOTE: Pump motor will not operate, but voltage will be applied.** Measure the voltage drop across the ABS ground circuit connection, with pump motor actuation enabled. Is the voltage below 0.1 volt? Yes → Go To 13 No → Repair the Ground circuit for an open. The CAB must sense all four wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator. Perform ABS VERIFICATION TEST - VER 1.	All
13	If there are no possible causes remaining, view repair. Repair Replace the Controller Anti-Lock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.	All
14	Turn the ignition off. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Make sure the Pump Motor connecter is secure. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Refer to any Hotline letters or Technical Service Bulletins that may apply. Were any problems found? Yes → Repair as necessary. The CAB must sense all four wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator. Perform ABS VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:

RIGHT FRONT SENSOR CIRCUIT FAILURE

When Monitored and Set Condition:

RIGHT FRONT SENSOR CIRCUIT FAILURE

When Monitored: Ignition on. The CAB monitors the wheel speed circuit every 7 milliseconds (ms).

Set Condition: If the CAB detects an open or shorted wheel speed sensor circuit, the Diagnostic Trouble Code (DTC) will set.

POSSIBLE CAUSES
RIGHT FRONT WHEEL SPEED SENSOR OR CONNECTOR DAMAGE
RIGHT FRONT WHEEL SPEED SENSOR CIRCUITS SHORTED OR OPEN
CAB-NO OUTPUT
RIGHT FRONT WHEEL SPEED SENSOR -- NO OUTPUT
CAB - UNABLE TO READ RIGHT FRONT WHEEL SPEED SENSOR SIGNAL
INTERMITTENT CIRCUIT DTC

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, record and erase DTC's. Turn the ignition off. Turn the ignition on. With the DRBIII®, read DTC's. Does the DRBIII® display Right Front Wheel Speed Sensor Circuit Failure DTC present right now? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition off. Inspect the Right Front Wheel Speed Sensor and Connector. Is the Sensor or Connector Damaged? Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Go To 3	All

RIGHT FRONT SENSOR CIRCUIT FAILURE — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the Right Front Wheel Speed Sensor connector. **Note: Check connector - Clean/repair as necessary.** Disconnect the CAB connector. **Note: Check connector - Clean/repair as necessary.** Turn the ignition on. Check the Right Front Wheel Speed Sensor 12 volt Supply and Signal circuits for a short to battery, ground, to each other and for open. For the purposes of this test, a short to ground must be below 15k ohms. Was any circuit short or open found? Yes → Repair Right Front Wheel Speed Sensor circuit short or open. Perform ABS VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn ignition off. Make sure the CAB is not disconnected. Disconnect the Left Front Wheel Speed Sensor connector. Turn ignition on. Measure the voltage across the Right Front Wheel Speed Sensor 12 Volt Supply and Signal circuits at the Right Front Wheel Speed Sensor connector. Is the voltage above 10 volts? Yes → Go To 5 No → Replace the Controller Antilock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.	All
5	Turn ignition off. Disconnect the CAB harness connector. Remove the harness strain relief to access the wires in the CAB connector. Using a DC voltmeter and special tool 6801, backprobe the Wheel Speed Sensor 12 volt Supply and Signal circuits at the CAB. Reconnect the CAB. Turn ignition on. Slowly rotate the right front wheel while observing voltmeter reading. Does the voltage change from approximately 1.6 volts to 0.8 volts as the wheel is rotated? Yes → Replace the CAB. Perform ABS VERIFICATION TEST - VER 1. No → Replace the Right Front Wheel Speed Sensor. Perform ABS VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Refer to any Hotline letters or Technical Service Bulletins that may apply. Were any problems found? Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
SYSTEM OVERVOLTAGE

When Monitored and Set Condition:

SYSTEM OVERVOLTAGE

When Monitored: Ignition on. The CAB monitors the Fused B(+) circuit at all times for proper system voltage.

Set Condition: If the voltage is above 16.5 volts for greater than 420 milliseconds (ms), the Diagnostic Trouble Code (DTC) is set.

POSSIBLE CAUSES
BATTERY OVERCHARGED
INTERMITTENT DTC
FUSED IGNITION SWITCH OUTPUT HIGH
GROUND CIRCUIT OPEN
CAB - INTERNAL FAULT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, erase DTC's. Turn the ignition off. Turn the ignition on. Start the engine. With the DRBIII®, read DTC's. Does the DRBIII® display System Overvoltage DTC? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition off. Inspect for battery charger connected to battery. Is a battery charger connected to the battery? Yes → Charge battery to proper level. Disconnect the battery charger. Clear DTC's. Perform ABS VERIFICATION TEST - VER 1. No → Go To 3	All

SYSTEM OVERVOLTAGE — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the CAB connector. **Note: Check connector - Clean/repair as necessary.** Start the engine. Raise engine speed above 1,800 RPM. Measure the battery voltage. Is the voltage above 16.5 volts ? Yes → Refer to appropriate service information for charging system testing and repair. Perform ABS VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off. Disconnect the CAB connector. **Note: Check connector - Clean/repair as necessary.** Measure the resistance of the ground circuits. Is the resistance below 1.0 ohm? Yes → Go To 5 No → Repair the Ground circuit for an open. Perform ABS VERIFICATION TEST - VER 1.	All
5	If there are no potential causes remaining, view repair. Repair Replace the Controller Anti-Lock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Refer to any Hotline letters or Technical Service Bulletins that may apply. Were any problems found? Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
SYSTEM UNDERVOLTAGE

When Monitored and Set Condition:

SYSTEM UNDERVOLTAGE

When Monitored: Ignition on. The CAB monitors the Fused Ignition Switch Output circuit voltage above 10 km/h (6 mph) every 7 milliseconds for proper system voltage.

Set Condition: If the voltage is below 9.5 volts, the Diagnostic Trouble Code (DTC) is set.

POSSIBLE CAUSES
BATTERY VOLTAGE LOW
INTERMITTENT DTC
FUSED IGNITION SWITCH OUTPUT CIRCUIT HIGH RESISTANCE
GROUND CIRCUIT OPEN
CAB - INTERNAL FAULT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, erase DTC's. Turn the ignition off. Turn the ignition on. Start the engine. Drive the vehicle above 16 km/h (10 mph) for at least 20 seconds. Stop the vehicle With the DRBIII®, read DTC's. Does the DRBIII® display System Undervoltage DTC? Yes → Go To 2 No → Go To 6	All
2	Engine Running. Measure the battery voltage. Is the battery voltage below 10 volts? Yes → Refer to appropriate service information for charging system testing and repair. Perform ABS VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the CAB connector. **Note: Check connector - Clean/repair as necessary.** Measure the resistance of the ground circuits. Is the resistance below 1.0 ohm? Yes → Go To 4 No → Repair the Ground circuit for an open. Perform ABS VERIFICATION TEST - VER 1.	All

SYSTEM UNDERVOLTAGE — Continued

TEST	ACTION	APPLICABILITY
4	Disconnect the CAB harness connector. Turn the ignition on. Measure the voltage of the Fused Ignition Switch circuit. Is the voltage above 10 volts? Yes → Go To 5 No → Repair the Fused Ignition Switch Output Circuit for high resistance Perform ABS VERIFICATION TEST - VER 1.	All
5	If there are no potential causes remaining, view repair. Repair Replace the Controller Antilock Brake. Perform ABS VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Refer to any Hotline letters or Technical Service Bulletins that may apply. Were any problems found? Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Test Complete.	All

Verification Tests

ABS VERIFICATION TEST - VER 1	APPLICABILITY
1. Turn the ignition off. 2. Connect all previously disconnected components and connectors. 3. Ensure all accessories are turned off and the battery is fully charged. 4. Ensure that the Ignition is on, and with the DRBIII, erase all Diagnostic Trouble Codes from ALL modules. Start the engine and allow it to run for 2 minutes and fully operate the system that was malfunctioning. 5. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the DRBIII, read DTC's from ALL modules. 6. If any Diagnostic Trouble Codes are present, return to Symptom list and troubleshoot new or recurring symptom. **7. NOTE: For Sensor Signal and Pump Motor faults, the CAB must sense all 4 wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator.** 8. If there are no DTC's present after turning ignition on, road test the vehicle for at least 5 minutes. Perform several antilock braking stops. **9. Caution: Ensure braking capability is available before road testing.** 10. Again, with the DRBIII® read DTC's. If any DTC's are present, return to Symptom list. 11. If there are no Diagnostic Trouble Codes (DTC's) present, and the customer's concern can no longer be duplicated, the repair is complete. Are any DTC's present or is the original concern still present? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

ADJUSTABLE PEDALS VERIFICATION TEST - VER 1	APPLICABILITY
1. If the Adjustable Pedals Module was replaced, program two pedal positions if equipped with memory function. 2. Activate the Adjustable Pedals through the full range of movement. 3. Verify that the Adjustable Pedals system is disabled with the vehicle in Reverse. 4. Verify that the Adjustable Pedals system is disabled with Speed Control activated. 5. With the DRBIII®, erase DTCs. 6. With the DRBIII®, read DTCs. Are any DTC's present or is the original complaint still present? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All

TABLE OF CONTENTS

TABLE OF CONTENTS - Continued

1.0 INTRODUCTION

The procedures contained in this manual include all of the specifications, instructions, and graphics needed to diagnose 45RFE/545RFE Electronic Automatic Transmission (EATX) problems. The diagnostics in this manual are based on the failure condition or symptom being present at the time of diagnosis.

When repairs are required, refer to the appropriate volume of the service manual for the proper removal and repair procedure.

Diagnostic procedures change every year. New diagnostic systems may be added and/or carryover systems may be enhanced. READ THIS MANUAL BEFORE TRYING TO DIAGNOSE A VEHICLE TROUBLE CODE. It is recommended that you review the entire manual to become familiar with all new and changed diagnostic procedures.

1.1 SYSTEM COVERAGE

This diagnostic procedures manual covers all 2002 Model Year WJ/WG equipped with a 45RFE/545RFE Automatic Transmission.

1.2 SIX -STEP TROUBLESHOOTING PROCEDURE

Diagnosis of the 45RFE/545RFE electronic transmission is done in six basic steps:

- Verification of complaint
- Verification of any related symptoms
- Symptom analysis
- Problem isolation
- Repair of isolated problem
- Verification of proper operation

2.0 IDENTIFICATION OF SYSTEM

The 45RFE/545RFE Transmission family can be identified by confirming the presence of a 23 pin electrical connector on the left hand side of the transmission oriented vertically near the manual lever.

3.0 SYSTEM DESCRIPTION AND FUNCTIONAL OPERATION

3.1 GENERAL DESCRIPTION

The 45RFE/545RFE electronic transmission is a conventional transmission in that it uses hydraulically applied clutches to shift a planetary gear train. However, the electronic control system replaces many of the mechanical and hydraulic components used in conventional transmission valve bodies.

The 45RFE/545RFE electronic transmission is a fully electronically controlled transmission. The Transmission Control Module (TCM) is similar to (but not the same as) the one used in the 41TE and 42LE transmissions, therefore many similarities exist in function and diagnosis.

The 45RFE/545RFE has an overrunning clutch (used in 1st gear), an electronically controlled torque converter clutch, 3 planetary gearsets, and six clutch packs. The clutches are called 2nd Clutch (2C), 4th Clutch (4C), Low/Reverse Clutch (LR), Reverse Clutch (RC), Underdrive Clutch (UD), and Overdrive Clutch (OD).

Although the 45RFE is considered a 4 speed transmission, it really has 5 forward gear ratios., the 545RFE is considered a 5 speed transmission, it really has 6 forward gear ratios. 2nd gear (1.67:1) and 2nd prime (1.50:1) gear are so close in ratio that they are not considered to be different gear ratios, although both are used as 2nd gear under certain conditions. During most upshift and downshift maneuvers, 2nd gear will be used. 2nd prime gear is only used for a high speed 4-2 downshift. The 545RFE transmission is essentially a software change to the TCM that allows an additional overdrive ratio of (.667:1). The gear ratio of 4th Prime is achieved by applying the 2C and OD clutches. The 4th Prime is used above 52 MPH. All gear ratios in the 45RFE/545RFE are achieved by applying two elements (clutches). During a shift, one element is released and another is applied, resulting in a different ratio. This is called a clutch to clutch shift. In order to perform a 4-2 downshift, two elements would have to be released and two different elements applied. The 2nd prime gear ratio allows a clutch to clutch 4-2' (2nd prime) downshift.

The oil pump in the 45RFE/545RFE is a dual stage positive displacement gear type pump. At idle and low engine speeds, both stages are working. Once the engine speed reaches a point where one side of the pump can supply the necessary system requirements, the second stage is vented. This pump configuration gives the pressure and flow of a large displacement pump at low speeds, and the economy of a small displacement pump at higher engine speeds. The oil pump housing also contains some of the valves that are found in the valve body in a 41TE or 42LE transmission. The Converter Clutch Switch Valve, Converter Clutch Regulator Valve, Torque Converter Limit Valve, and the Pressure Regulator Valve, are all found in the oil pump housing.

The electronic control system consists of a Transmission Control Module (TCM), a Transmission Range Sensor (TRS), an Input Speed Sensor (ISS), an Output Speed Sensor (OSS), a Line Pressure Sensor (LPS), a Transmission Temperature Sensor (TTS), five pressure switches, and seven solenoids. Each clutch pack has a corresponding solenoid and pressure switch except for the reverse clutch which is controlled by the manual valve. The other two solenoids are called the Multi Select (MS) solenoid and the Pressure Control Solenoid (PCS).

The MS solenoid is used to control the LR clutch during P-R and N-R garage shifts and to control the OD clutch when the Manual Valve is in the ″D″ position as reported by the TRS. If the manual valve is slightly out of position, the TRS will indicate a temporary zone (T3 or T4). In this case the OD clutch will be controlled by the OD solenoid. Note that if the TRS indicates a temporary zone, this is a valid PRNDL code and will not set a DTC P0706(28). If the PRNDL code consistently indicates a temporary zone while the shift lever is in the ″D″ position, this would indicate some sort of mechanical problem in the shift linkage as opposed to an electrical TRS problem. Note: vehicle operation in the T3 temporary zone can set a DTC P1715(65).

3.2 FUNCTIONAL OPERATION

The 45RFE/545RFE electronic transmission has a fully adaptive control system. The system performs its functions based on continuous real-time sensor feedback information. The control system automatically adapts to changes in engine performance and friction element variations to provide consistent shift quality. The control system ensures that clutch operation during upshifting and downshifting is more responsive without increased harshness.

The Transmission Control Module (TCM) continuously checks for electrical problems, mechanical problems, and some hydraulic problems. When a problem is sensed, the TCM stores a diagnostic trouble code (DTC). Some of these codes cause the transmission to go into ″limp-in″ or ″default″ mode. The 45RFE/545RFE has three default modes:

(I) Immediate shutdown - The TCM de-energizes the transmission control relay. This causes the transmission system to immediately default to third gear if shift lever is in the ″D″ position, or 2nd gear if it is in the ″2″ or ″L″ positions. Park, Neutral, and Reverse are still available.

(O) Orderly Shutdown - If the TCM recognizes a problem that does not require an immediate shutdown, the transmission will maintain the current gear and the transmission control relay will remain energized until de-energizing it will not overspeed the engine. When the vehicle speed reaches a reasonable level the TCM de-energizes the transmission control relay. This causes the transmission system to immediately default to third gear if shift lever is in the ″D″ position, or 2nd gear if it is in the ″2″ or ″L″ positions. Park, Neutral, and Reverse are still available.

(L) Logical Shutdown with Recovery - The TCM does not de-energize the Transmission Control Relay. Instead, the transmission will utilize 1st and 3rd gears while in ″D″, and will use 2nd while in ″2″ or ″L″. All transmission operation in this mode will be at a preset line pressure (open loop). The transmission will resume normal operation (recover) if the detected problem goes away. Three recoveries are permitted in a given key, after the fourth occurrence the operation described above will be maintained.

Once the DRBIII® is in the ″EATX″ portion of the diagnostic program, it constantly monitors the TCM to see if the system is in limp-in mode. If the transmission is in limp-in mode, the DRBIII® will flash the red LED.

3.2.1 TRANSMISSION OPERATION AND SHIFT SCHEDULING AT VARIOUS OIL TEMPERATURES

The transmission covered in this manual has unique shift schedules depending on the temperature of the transmission oil. The shift schedule is modified to extend the life of the transmission while operating under extreme conditions.

The oil temperature is measured with a Temperature Sensor on the 45RFE/545RFE transmission. The Temperature Sensor is an integral component of the Transmission Range Sensor (TRS). If the Temperature Sensor is faulty, (DTC P-1799) the transmission will default to a ″calculated″ oil temperature. Oil temperature will then be calculated using engine coolant temperature, battery/ambient temperature, and engine off time from the Body Control Module (BCM). These inputs are received from the communication bus periodically and are used to initialize the oil temperature at start up. Once the engine is started, the TCM updates the transmission oil temperature based on torque converter slip speed, vehicle speed, gear, and engine coolant temperature to determine an estimated oil temperature during vehicle operation. Vehicles using ″calculated oil temperature″ track oil temperature reasonably accurately during normal operation. However, if a transmission is overfilled, a transmission oil cooler becomes restricted, or if a customer drives aggressively in low gear, the calculated oil temperature will be inaccurate. Consequently the shift schedule selected may be inappropriate for the current conditions. The key highlights of the various shift schedules are as follows:

Extreme Cold: Oil temperature below -27°C (-16°F)

Goes to ″Super Cold″ schedule when temp rises above -24°C (-12°F) oil temperature
Park, Reverse, Neutral and 1st and 3rd gear only
No Torque Converter Clutch engagement

Super Cold: Oil temperature between -27°C (-16°F) and -17°C (0°F)

Goes to ″Cold″ schedule above -12°C (10°F) oil temperature
Delayed 2-3 upshift
Delayed 3-4 upshift
Early 4-3 coastdown shift
Early 3-2 coastdown shift
No 3-1 coastdown or kickdown
High speed 4-2, 3-2, 2-1 kickdown shifts are prevented
No Torque Converter Clutch engagement

Cold: Oil temperature between -17°C (0°F) and 2°C (36°F)

Goes to ″Warm″ schedule when temp rises above 4.4°C (40°F) oil temperature
Shifts at higher throttle openings will be early
High speed 4-2, 3-2, 2-1 kickdown shifts are prevented
Delayed 3-4 upshift
Early 4-3 coastdown shift
Torque Converter Clutch engagement allowed with sump temp greater than 18°C (65°F)

Warm: Oil temperature between 2°C (36°F) and 27°C (80°F)

Normal operation (upshifts, kickdowns, and coastdowns)
No Torque Converter Clutch engagement

Hot (Normal operation): Oil temperature between 27°C (80°F) and 115°C (240°F)

Goes to ″Overheat″ schedule above 115°C (240°F) oil temperature
Reverts to ″Hot″ when temp falls below 110°C (230°F)
Normal operation (upshifts, kickdowns, and coastdowns)
Normal Torque Converter Clutch engagement operation

Overheat: Oil temperature above 115°C (240°F) or engine coolant temperature above 118°C (244°F)

Reverts to ″Hot″ when temp falls below 110°C (230°F) oil temp or ″Overheat″ above 115°C (240°F) oil temp.
Delayed 2-3 upshift 40-51 km/h (25-32 MPH)
Delayed 3-4 upshift 66-77 km/h (41-48 MPH)
3rd gear FEMCC from 48-77 km/h (30-48 MPH)
3rd gear PEMCC from 43-50 km/h (27-31 MPH)
A DTC P0218 High Temperature Operation Activated will be set in the TCM.

Causes for operation in the wrong temperature shift schedule:

Extreme Cold or Cold shift schedule at start up:
Temperature Sensor or circuitry.

Overheat shift schedule after extended operation:
Operation in city traffic or stop and go traffic
Engine idle speed too high - Stuck AIS motor
Aggressive driving in low gear
Long idle time in drive position
Trailer towing in OD gear position (use ″3″ position if frequent shifting occurs)
Cooling system failure causing engine to operate over 110°C (230°F)
Engine coolant temperature stays low too long - If engine coolant temperature drops below 66°C (150°F), the transmission will disengage EMCC. Extended operation with the EMCC disengaged will cause the transmission to overheat.
Brake switch or circuitry - The TCM disengages the TCC when it receives a signal from the PCM that the brake has been depressed. A problem with the brake switch or circuitry will cause the EMCC to disengage. Extended operation with the EMCC disengaged will cause the transmission to overheat.
Transmission fluid overfilled
Transmission cooler or cooler lines restricted
Engine cooling fan inoperative
Temperature Sensor or circuitry.

3.2.2 LINE PRESSURE CONTROL

Proper control of the transmission line pressure is essential for proper operation. The 45RFE/545RFE normally uses closed loop line pressure control, where actual line pressure (reported by the line pressure sensor) is continuously monitored. The TCM determines the desired (target) line pressure which is required, and adjusts the Pressure Control Solenoid (PCS) until the actual line pressure matches the desired line pressure value. In the event of a line pressure sensor failure DTC P0932(CA), the TCM changes to an open loop control at an essentially constant line pressure.

Proper diagnosis of line pressure systems is facilitated by the use of a special tool (T-fitting - Miller #8259) which allows the use of a mechanical pressure gauge to compare the line pressure sensor reading on the DRBIII® to the gauge pressure. Technicians should compare the mechanical gauge reading with the ″actual″ and ″desired″ line pressure reading on the DRBIII®. All three readings should closely match in pressure. Because the mechanical and actual line pressure may not match the desired at low engine speeds (due to low pump output RPM), line pressure should always be checked at 1500 - 2000 RPM.

Typical Line Pressure problems include:

- Mechanical and "actual" readings both less than desired
  - If the mechanical and "actual" readings do not increase significantly as engine speed is raised above 2000 RPM, the pressure control solenoid is usually at fault. The pressure control solenoid is usually accompanied by DTC's P0867(C8) and P0868(C9). The PCS is located in the Transmission Solenoid/TRS assembly.
  - If the mechanical and "actual" readings vary with engine speed (above 2000 RPM), the fault is often a sticking main regulator valve. This valve is located in the transmission pump assembly.
- "Actual" reading on the DRBIII® differs from the Mechanical Pressure reading (higher or lower) by more than 69 kPa (10 PSI). This is sometimes accompanied by a DTC P0869(CB). The fault is usually in the Line Pressure Sensor or the Line Pressure Sensor Wiring.
- All three readings match, but the "actual" reading exhibits momentary intermittent pressure increases to 1724 kPa (250 PSI). The line Pressure Sensor is usually the problem. This will cause erratic shift quality (particularly a harsh 3-1 coast down shift), repair by replacing the Line Pressure Sensor.

3.2.3 DRIVE LEARN PROCEDURE

Procedure To Learn A Smooth 1st Neutral To Drive Shift:

Perform this procedure only if the complaint is for a delayed or harsh shift the first time the transmission is put into gear after the vehicle is allowed to set with the engine not running for at least 10 minutes. Use the following steps to have the TCM learn the 1st N-1 UD CVI.

NOTE: The transmission oil temperature must be between 80 - 110°F (27 - 43°C).

1. Start the engine only when the engine and ignition have been off for at least ten (10) minutes.
2. With the vehicle at a stop and the service brake applied, record the UD CVI while performing a Neutral to Drive shift. During the shift, the UD CVI will temporarily show a different value which is the 1st N-1 UD CVI. The 1st N-1 UD CVI account for air entrapment in the UD clutch that may occur after the engine has been off for a period of time.
3. Repeat steps 1 and 2 until the recorded 1st N-1 UD CVI value stabilizes.

NOTE: It is important that this procedure be performed when the transmission temperature is between 80 - 110°F (27 - 43°C). If this procedure takes too long to complete fully for the allowed transmission oil temperature, the vehicle may be returned to the customer with an explanation that the shift will improve daily during normal vehicle usage. The TCM also learns at higher oil temperatures, but these values (line pressure correction values) are not available for viewing on the DRBIII®.

Procedure To Learn A Smooth Neutral To Drive Garage Shift:

Perform this procedure if the complaint is for a delayed or harsh shift when the transmission is put into gear after the vehicle has had its first shift. Use the following steps to have the TCM learn the N-1 UD CVI.

NOTE: The transmission oil temperature must between 80 - 110°F (27 - 43°C) to learn the UD CVI. Additional learning occurs at temperatures as low as 0°F and as high as 200°F. This procedure may be performed at any temperature that experiences poor shift quality. Although the UD CVI may not change, shift quality should improve.

1. Start the vehicle engine and shift to drive.
2. Move the vehicle forward to a speed of at least 16 km/h (10 MPH) and come to a stop. This ensures no air is present in the UD hydraulic circuit.
3. Perform repeated N-1 shifts at a stop while pausing in Neutral for at least 2-3 seconds and monitor UD CVI volume until the value stabilizes. The value will change during the N-D shift. This is normal since the UD value is different for the N-1 shift then the normal value shown which is used for 4-3 coastdown and kickdowns. Perform repeated shifts in this temperature range until the UD CVI value stabilizes and the N-1 shifts become smooth.
4. This procedure may be performed at any temperature that experiences poor N-1 shift quality. Although the UD CVI may not changes, shift quality should improve.

Procedure To Learn The 1st 2-3 Shift After A Restart Or Shift To Reverse:

Use the following steps to have the TCM learn the 1st 2-3 shift OD CVI.

NOTE: The transmission oil temperature must be above 80°F (27°C).

1. With the vehicle engine running, select reverse gear for over 2 seconds.
2. Shift the transmission to Drive and accelerate the vehicle from a stop at a steady 15 degree throttle opening and perform a 2-3 shift while noting the OD CVI. During the shift, a different value may appear on the screen, which is the 1st 2-3 OD CVI.
3. Repeat steps 1 and 2 until the 1st 2-3 upshift becomes smooth and the 1st 2-3 OD CVI stabilizes.

Procedure To Learn A Smooth 2-3 And 3-4 Upshift:

Use the following steps to have the TCM learn the OD and 4C CVI's.

NOTE: The transmission oil temperature must be above 110°F (43°C).

1. Accelerate the vehicle from a stop at a steady 15 degree throttle opening and perform multiple 1-2, 2-3, and 3-4 upshifts. The 2nd 2-3 shift following a restart or shift to reverse will be shown during the shift as a value between the 1st 2-3 OD CVI and the normal OD CVI. Updates to the normal OD CVI will occur after the 2nd shift into 3rd gear, following a restart or shift to reverse.
2. Repeat step 1 until the 2-3 and 3-4 shifts become smooth and the OD and 4C CVI become stable.

Procedure To Learn A Smooth 4-3 Coastdown And Part Throttle 4-3 Kickdown:

Use the following steps to have the TCM learn the UD shift volume.

NOTE: The transmission oil temperature must be above 110°F (43°C).

1. At a vehicle speed between 64 - 97 Km/H (40 - 60 MPH), perform repeated 4-3 kickdown shifts.
2. Repeat step 1 until the UD volume becomes somewhat stable and the shift becomes smooth.

Procedure To Learn A Smooth 1-2 Upshift and 3-2 Kickdown:

Use the following steps to have the TCM learn the 2C shift volume.

NOTE: The transmission oil temperature must be above 110°F (43°C).

1. With a vehicle speed below 48 Km/H (30 MPH) and the transmission in 3rd gear, perform multiple 3-2 kickdowns.
2. Repeat step 1 until the 3-2 kickdowns become smooth and the 2C CVI becomes stable.

Procedure To Learn A Smooth Manual 2-1 Pulldown Shift As Well As A Neutral To Reverse Shift:

Use the following steps to have the TCM learn the LR volume.

NOTE: The transmission oil temperature must be above 110°F (43°C).

1. With the vehicle speed around 40 - 48 Km/H (25 - 30 MPH) in Manual 2nd, perform manual pulldowns to Low or 1st gear at closed throttle.
2. Repeat step 1 until the LR CVI become stable and the manual 2-1 becomes smooth.

Procedure To Learn A Smooth Neutral To Reverse Shift:

Perform the following shifts.

NOTE: The transmission oil temperature must be above 110°F (43°C).

1. With the vehicle at a stop, perform Neutral to Reverse shifts until the shift is smooth. An unlearned Neutral to Reverse shift may be harsh or exhibit a double bump. If any of the shifts are still not smooth after the clutch volume stabilizes, an internal transmission problem may be present.

Procedure To Learn A Smooth 4-5 Upshift for 545RFE:

Use the following steps to have the TCM learn the 2CA CVI.

NOTE: The transmission oil temperature must be above 110°F (43°C).

1. Accelerate the vehicle through 88 Km/H (55mph) at a steady 10-15 degree throttle opening and perform multiple 4-5 upshifts.
2. Repeat step 1 until the 4-5 shift become smooth and the 2C(A) CVI become stable. There is a separate 2C volume used and learned for 4-5 shifts, 2C(A). It is independent of the 2C CVI learned on 3-2 kickdowns.

3.3 DIAGNOSTIC TROUBLE CODES

Diagnostic trouble codes (DTC's) are codes stored by the Transmission Control Module (TCM) that help us diagnose Transmission problems. They are viewed using the DRBIII® scan tool.

Always begin by performing a visual inspection of the wiring, connectors, cooler lines and the transmission. Any obvious wiring problems or leaks should be repaired prior to performing any diagnostic test procedures. Some engine driveability problems can be misinterpreted as a transmission problem. Ensure that the engine is running properly and that no PCM DTC's are present that could cause a transmission complaint.

If there is a communication bus problem, trouble codes will not be accessible until the problem is fixed. The DRBIII® will display an appropriate message. The following is a possible list of causes for a bus problem:

- open or short to ground/battery in PCI bus circuit (pin 43).
- internal failure of any module or component on the bus

Each diagnostic trouble code is diagnosed by following a specific testing sequence. The diagnostic test procedures contain step-by-step instructions for determining the cause of a transmission diagnostic trouble code. Possible sources of the code are checked and eliminated one by one. It is not necessary to perform all of the tests in this book to diagnose an individual code. These tests are based on the problem being present at the time that the test is run.

If the TCM records a DTC that will adversely affect vehicle emissions, it will request (via the communication bus) that the PCM illuminate the Malfunction Indicator Lamp (MIL). Although these DTC's will be stored in the TCM immediately as a 1 trip failure, it may take up to five minutes of accumulated trouble confirmation to set the DTC and illuminate the MIL. Three consecutive successful OBDII/EUROIII trips or clearing the DTC's with a diagnostic tool (DRBIII® or equivalent) is required to extinguish the MIL. When the TCM requests that the PCM illuminate the MIL, the PCM sets a DTC ($89) to alert the technician that there are DTC's in the TCM. This must also be erased in the PCM in order to extinguish the MIL.

3.3.1 HARD CODE

Any Diagnostic Trouble Code (DTC) that is set whenever the system or component is monitored is a HARD code. This means that the problem is there every time the TCM checks that system or component. Some codes will set immediately at start up and others will require a road test under specific conditions. It must be determined if a code is repeatable (Hard) or intermittent before attempting diagnosis.

3.3.2 ONE TRIP FAILURES

A One Trip Failure, when read from the TCM, is a hard OBDII/EUROIII code that has not matured to the full 5 minutes. This applies only to codes that will turn on the MIL after 5 minutes of substituted gear operation.

3.3.3 INTERMITTENT CODE

A diagnostic trouble code that is not there every time the TCM checks the circuit or function is an ″intermittent″ code. Some intermittent codes, such as codes P0932(CA), P0891(14), P0888(15), P0725(18), P1694(19), P0841(81), P0846(82), P0871(84), P0988(88), P0876(90), P0750(C1), P0755(C2), P0760(C3), P0770(C4), P0765(C5), P2706(C6), P1793(48), P0715(56), P0720(57), P1794(58), and P1799(74) are caused by wiring or connector problems. However intermittent codes P0731(51), P0732(52), P0733(53), P0734(54), P0736(50), P0735(59), P1736(55) (Speed ratio codes) are usually caused by intermittent hydraulic seal leakage in the clutch and/or accumulator circuits. Intermittent speed ratio codes can be set by intermittent speed sensor circuitry or by line noise being induced onto one or both of the speed sensor signal circuits. Problems that come and go like this are the most difficult to diagnose, they must be looked for under the specific conditions that cause them.

3.3.4 STARTS SINCE SET COUNTER

The Starts Since Set counter counts the number of times the vehicle has started since the most recent DTC was set. The counter will count up to 255 starts. Note that this counter only applies to the last code set.

When there are no diagnostic trouble codes stored in memory, the DRBIII® will display ″NO DTC's PRESENT″ and the reset counter will show ″STARTS SINCE CLEAR″ = XXX.

The number of starts helps determine if the diagnostic trouble code is hard or intermittent.

- If the number of starts is less than 3, the code is usually a hard code.
- If the number of starts is greater than 3, it is considered an intermittent code. This means that the engine has been started most of the time without the code recurring.

3.3.5 TROUBLE CODE ERASURE

A Diagnostic trouble code will be cleared from TCM memory if it has not reset for 40 warm-up cycles.

A warm-up cycle is defined as ″sufficient vehicle operation such that the coolant temperature has risen by at least 22°C (40°F) from engine starting and reaches a minimum temperature of 71°C (160°F). The Malfunction Indicator Lamp (MIL) will turn off after 3 good trips or when the DTC's are cleared from the TCM.

3.3.6 LIST OF DIAGNOSTIC TROUBLE CODES (DTC) (Detailed descriptions follow list)

The TCM may report any of the following DTC's.

DTC	P-Code	Name of Code	Limp-in	MIL
11	P0613	Internal TCM	Yes	Yes
12	P1684	Battery was disconnected	No	No
13	P0613	Internal TCM	Yes	Yes
14	P0891	Relay output always on	Yes	Yes
15	P0888	Relay output always off	Yes	Yes
16	P0605	Internal TCM	Yes	Yes
17	P0604	Internal TCM	Yes	Yes
18	P0725	Engine speed sensor circuit	Yes	Yes
19	P1694	Bus communication with engine module	No	No
28	P0706	Check shifter signal	No	No
29	P0120	Throttle position sensor signal circuit	No	No
35	P0944	Loss of prime	No	No
36	P1790	Fault immediately after shift	No	No
37	P1775	Solenoid switch valve latched in TCC position	No	Yes
38	P0740	Torque converter clutch control circuit	No	Yes
45	P0613	Internal TCM	No	No
47	P1776	Solenoid switch valve latched in L-R position	Yes	Yes
48	P1793	TRD link communication error	No	No
50	P0736	Gear ratio error in reverse	Yes	Yes
51	P0731	Gear ratio error in 1st	Yes	Yes
52	P0732	Gear ratio error in 2nd	Yes	Yes
53	P0733	Gear ratio error in 3rd	Yes	Yes
54	P0734	Gear ratio error in 4th	Yes	Yes
55	P1736	Gear ratio error in 2nd Prime	Yes	Yes
56	P0715	Input speed sensor error	Yes	Yes
57	P0720	Output speed sensor error	Yes	Yes
58	P1794	Speed sensor ground error	Yes	Yes
59	P0735	Gear ratio error in 4th Prime	Yes	Yes
60	P2700	Inadequate Element Volume LR	No	No
61	P2701	Inadequate Element Volume 2C	No	No
62	P2702	Inadequate Element Volume OD	No	No
63	P2703	Inadequate Element Volume UD	No	No
64	P2704	Inadequate Element Volume 4C	No	No
65	P1715	Restricted Port in T3 Range	No	No
74	P1799	Calculated Oil temperature in use	No	No
75	P0218	High temperature operation activated	No	No
76	P0884	Power up at speed	No	No
80	P0890	Switched battery	Yes	Yes
81	P0841	L-R pressure switch sense circuit	Yes	Yes
82	P0846	2C pressure switch sense circuit	Yes	Yes
84	P0871	OD pressure switch sense circuit	Yes	Yes
88	P0988	4C pressure switch sense circuit	Yes	Yes
90	P0876	UD pressure switch sense circuit	Yes	Yes
A2	P0845	2C hydraulic pressure test failure	Yes	Yes
A4	P0870	OD hydraulic pressure test failure	Yes	Yes
A8	P0987	4C hydraulic pressure test failure	Yes	Yes
B0	P0875	UD hydraulic pressure test failure	Yes	Yes
C1	P0750	L-R solenoid circuit	Yes	Yes

The TCM may report any of the following DTC's.				
DTC	**P-Code**	**Name of Code**	**Limp-in**	**MIL**
C2	P0755	2C solenoid circuit	Yes	Yes
C3	P0760	OD solenoid circuit	Yes	Yes
C4	P0770	4C solenoid circuit	Yes	Yes
C5	P0765	UD solenoid circuit	Yes	Yes
C6	P2706	MS solenoid circuit	Yes	Yes
C8	P0867	Line pressure fault	No	No
C9	P0868	Line pressure low	No	No
CA	P0932	Line pressure sensor fault	No	No
CB	P0869	Line pressure high	No	No
Yes (underlined) indicates that this DTC can take up to five minutes of problem identification before illuminating the MIL.				

3.3.7 DTC DESCRIPTIONS

Name of code: P0604, P0605, P0613(11, 13, 16, 17 or 45) - Internal Controller
When monitored: Whenever the key is in the Run or Run/Start position.
Set condition: This code is set whenever Transmission Control Module (TCM) senses an internal error
Theory of operation: The TCM is constantly monitoring it's internal processor. If an internal problem is detected, this DTC will be set. This DTC can also be set by a bad ground to the TCM and/or Trans Control Relay. In fact, this DTC is rarely set due to a TCM error, it is usually set by a poor ground.
Transmission Effects: The MIL will illuminate (this DTC can take up to five minutes of problem identification before illuminating the MIL) and the transmission system will default to the Immediate Shutdown routine.
Possible causes:

> TCM ground circuit. (check main ground attachment to engine block)

> Relay ground circuit. (check main ground attachment to engine block)

> TCM

Name of code: P1684(12) - Battery was Disconnected (Info Only)
When monitored: Whenever the key is in the Run or Run/Start position.
Set condition: This code is set whenever Transmission Control Module (TCM) is disconnected from battery power (B+) or ground. It will also be set during the DRBIII® Quick Battery Disconnect procedure.
Theory of operation: A battery backed RAM (Random Access Memory) is used to maintain some learned values. When the battery B(+) is disconnected, the memory is lost. When the B(+) is restored, this memory loss is detected by the TCM. The code is set and the learned values are initialized to known constants or previously learned values from EEPROM (Electronic Erasable Programmable Read Only Memory). This results in the reinitialization of some parameters.
Transmission Effects: Loss of trouble code data. The Transmission system will default to the Immediate shutdown routine if power is lost while operating the vehicle. Normal operation is resumed if the power is restored during the same key start.
Possible causes:

> Battery voltage removed from TCM (Fused B+)

> TCM disconnected

> Dead Battery

> Low battery voltage during cranking

> Quick Battery Disconnect by DRBIII® or MDS

> Bad TCM ground circuit.

Name of code: P0891(14) - Relay Always On
When monitored: When ignition key is turned from ″off″ position to ″run″ position and/or ignition key is turned from ″crank″ position to ″run″ position.
Set condition: This code is set if the Transmission Control Module (TCM) senses greater than 3 volts at the Trans Control Relay Output terminal(s) of the TCM prior to the TCM energizing the relay.
Theory of operation: The transmission control relay is used to supply power to the solenoids and pressure switches when the transmission is in normal operating mode. The relay output is fed back to the TCM through pins 16, 17, and 36. It is referred to as ″Transmission Control Relay Output″. This circuit does not supply power to the TCM, it is only a sense circuit. When the relay is off, no power is supplied to the solenoids and pressure switches, and the transmission is in ″limp-in″ or ″default″ mode.

Transmission Effects: The MIL will illuminate (this DTC can take up to five minutes of problem identification before illuminating the MIL) and the transmission system will default to the Immediate Shutdown routine.

Possible causes:

> Short to voltage in the Transmission Solenoid/TRS Assembly (internal into any solenoid control circuit)

> Short to voltage on any solenoid control circuit

> Relay contacts stuck together.

> Short to voltage in Transmission Control Relay output circuit(s).

> Short to voltage in Transmission Relay Control circuit.

> Short to voltage on any pressure switch sense circuit.

> TCM connector problems.

> TCM.

Name of code: P0888(15) - Relay Output Always Off

When monitored: Continuously

Set condition: This code is set when less than 3 volts are present at any transmission control relay output (pins 16,17 or 36) circuits at the Transmission Control Module (TCM) when the TCM is energizing the relay.

Theory of operation: The Transmission Control Relay is used to supply power to the solenoids and pressure switches when the transmission is in normal operating mode. The relay output is fed back to the TCM through pins 16, 17, and 36. It is referred to as ″Transmission Control Relay Output″. This circuit does not supply power to the TCM, it is only a sense circuit. When the relay is off, no power is supplied to the solenoids and pressure switches, and the transmission is in ″limp-in″ or ″default″ mode.

After a controller reset (ignition key turned to the ″run″ position or after cranking engine), the controller energizes the relay. Prior to this the TCM verifies that the contacts are open by checking for no voltage at the switched battery terminals. After the relay is energized, the TCM monitors the terminals to verify that the voltage is greater than 3 volts.

Transmission Effects: The MIL will illuminate (this DTC can take up to five minutes of problem identification before illuminating the MIL) and the transmission system will default to the Immediate Shutdown routine.

Possible causes:

> Transmission Control Relay (intermittent relay function caused by oxidized or contaminated relay contacts)

> Short to ground or open circuit in the transmission control relay output circuit(s)

> Short to ground or open circuit in the Transmission Solenoid/TRS assembly

> TCM connector problem

> Relay connector problem

> Relay Ground circuit

> TCM Ground circuit(s)

> TCM

Name of code: P0725(18) - Engine Speed Sensor Circuit

When monitored: Continuously with engine running.

Set condition: This code is set when the engine speed calculated by the Transmission Control Module (TCM) is less than 390 RPM, while the engine speed broadcast by the PCM is greater than 383 RPM. The DTC also sets if the calculated engine speed is greater than 8000 RPM for more that 2.0 seconds. Theory of operation: The TCM uses the crank sensor signal to calculate engine RPM. The TCM uses RPM data from the PCM which is broadcast over the communication bus to determine if the engine is running. The TCM continuously compares calculated engine speed to the engine RPM reported on the bus, by the PCM, so that loss of crankshaft position sensor signal to the TCM will not be misinterpreted as engine not running.

Transmission Effects: The MIL will illuminate (this DTC can take up to five minutes of problem identification before illuminating the MIL) and the transmission system will default to the Logical Shutdown routine.

Possible causes:

> Open or short in engine speed sensor circuit. (Crank sensor signal)

> TCM connector problems (Crank sensor signal or sensor ground terminals)

> Open or short in sensor ground circuit

> Low engine idle speed

> TCM

> PCM.

Name of code: P1694(19) - Bus Communication with Engine Module

When monitored: Continuously with key on.

Set condition: If no bus messages are received from the Powertrain Control Module (PCM) for 10 seconds.

Theory of operation: The TCM communicates with the PCM using the communication bus. It relies on certain information to function properly. The TCM continuously monitors the bus to check for messages broadcast from the PCM.

Transmission Effects: Delayed 3-4 shifts. No EMCC and early 3-4 shifts for a few minutes after engine is started. Generally poor shift quality.

Possible causes:

> Open or shorted bus circuit

> TCM

> PCM

Name of code: P0706(28) - Check Shifter Signal

When Monitored: Continuously with the key on.

Set Condition: Any occurrences of an invalid PRNDL code which lasts for more than 0.028 second.

Theory of Operation: The C1 through C5 (TRS T1, TRS T2, TRS T3, TRS T41, and TRS T42) sense circuits communicate the shift lever position to the TCM. Each circuit is terminated at the transmission with a switch. Each switch can be either open or closed, depending on the shift lever position. The TCM can decode this information and determine the shift lever position. Each shift lever position has it own unique combination of closed and open switches. This is called a PRNDL code. There are 5 switches, therefore: there are many possible combinations of open and closed switches (codes). There are 12 valid codes, two for neutral, one for each other gear position (5), and five temporary (transition zone) codes. The remainder of the codes should **never occur,** these are called invalid codes.

Transmission Effects and possible causes: (This code alone will not illuminate the MIL)

> Excessive metal debris in the tranmsission oil pan

> Worn Code Plate. Check for heavy wearing by TRS switch contacts

> Intermittent C1 through C5 (T1, T2, T3, T41 or T42) circuits. Check for corrosion, terminal push-outs or spread terminals at 60-way TCM connector and/or 23-way transmission connector.

> TRS connector not plugged in, or unplugged with the key on.

> TRS C1 through C5 (T1, T2, T3, T41, or T42) circuit(s) are either open, shorted to ground, or shorted to 12 volts.

> TRS

> TCM

SHIFT LEVER ERROR CODES REPORTED BY THE DRBIII®

ERROR CODE	SWITCH STUCK	POSITION
1	T41/C1 STUCK	OPEN
2	T41/C1 STUCK	CLOSED
3	T42/C2 STUCK	OPEN
4	T42/C2 STUCK	CLOSED
5	T3/C3 STUCK	OPEN
6	T3/C3 STUCK	CLOSED
7	T1/C4 STUCK	OPEN

80b3845e

Name of code: P0120(29) - Throttle Position Signal

When monitored: Whenever the engine is running.

Set condition: This code is set if the throttle angle goes out of range or changes erratically i.e. faster than the throttle body motion should occur.

Theory of operation: The Transmission Control Module (TCM) receives the throttle position signal from the Throttle Position Sensor (TPS). The TPS has a 5-volt pull up supplied from the Powertrain Control Module (PCM). The signal is checked for out-of-range as well as intermittent (excessive signal changes).

Transmission Effects: The MIL will illuminate, the transmission system will not go into limp-in mode. The TCM will use a ″calculated throttle angle″ supplied by the PCM over the communication bus. If the communication bus is unavailable, the TCM will use a default throttle angle of 24(degrees for the key start in which the code was set. The TCM will try to use the TPS signal again on the next key start. The vehicle may experience extremely erratic transmission shifting just prior to setting the code. If the intermittent does not last long enough to set the code, the customer will say that the transmission violently hunts between gears.

Possible causes:

> Open or shorted TPS signal and/or ground circuits

> TCM connector problems

> Failed TPS or TPS connector (Check PCM DTC's)

> PCM

> TCM

Name of code: P0944(35) - Loss Of Prime

When monitored: If the transmission is slipping in any forward gear and all the pressure switches are indicating no pressure, a loss of prime test is run.

Set condition: If the transmission begins to slip in any forward gear, and all pressure switches are open, a loss of prime test begins. All available elements are momentarily turned on by the Transmission Control Module (TCM) to see if pump prime exists. The code is set if none of the pressure switches respond. The TCM will continue to run the loss of prime test until pump pressure returns. Note: Loss of Prime test is not run when transmission temperature is ″Super Cold″.

Theory of operation: The loss of prime test is used to prevent transmission defaults, which can be caused by a lack of pump prime.

Transmission Effects: Vehicle will not move or transmission slips. Normal operation will continue if pump prime returns.

Possible causes:

> Low transmission fluid level

> Transmission fluid filter improperly installed (Seal installed onto filter neck instead of into pump bore, seal not fully seated against pump bore housing, filter neck not engaged into pump, bolts loose or O-ring missing or damaged)

> Transmission fluid filter clogged, damaged or cracked

> Transmission has massive hydraulic leak (valve body pipe plugs missing, etc.)

> Transmission oil pump

> Transmission oil pump drive is sheared or damaged

> PRNDL indicates a valid OD code in the hydraulic reverse position

Name of code: P1790(36) - Fault Immediately After Shift

When monitored: When a speed ratio error DTC (50 through 55) is stored.

Set condition: This code is set if the associated speed ratio code is stored within 1.3 seconds after a shift.

Theory of operation: This code will only be stored along with a 50 series code. If this code is set, it indicates a probable hydraulic (line pressure) or mechanical problem exists. When this code is set, diagnosing the transmission should be based on the associated speed ratio code and mechanical causes should be considered first.

Transmission Effects: None

Possible causes:

> Mechanical causes as listed under associated speed ratio code.

> Inadequate line pressure

> Cut or damaged clutch piston seals

Name of code: P1775(37) - Solenoid Switch Valve Latched in TCC Position

When monitored: During an attempted shift into 1st gear.

Set condition: This code is set if 6 unsuccessful attempts are made to get into 1st gear, with transmission temp above 27°C (80°F), in one given key start.

Theory of operation: The solenoid switch valve (SSV) controls the direction of the transmission fluid when the L-R solenoid is energized. The SSV will be in the downshifted position in 1st gear, thus directing the fluid to the L-R clutch circuit. In 2nd, 3rd, and 4th, it will be in the upshifted position and directs the fluid into the torque converter clutch (TCC). When shifting into 1st gear, a special hydraulic sequence is performed to ensure SSV movement into the downshifted position. The L-R pressure switch is monitored to confirm SSV movement. If movement is not confirmed (the L-R pressure switch does not close), EMCC is inhibited until SSV operation is confirmed.

Transmission Effects: Transmission will have 1st gear, and no EMCC operation. The MIL will illuminate after 5 minutes of no EMCC operation.

Possible causes:

> Valve body - Solenoid Switch Valve stuck in TCC position

> L-R solenoid armature or plunger broken (should also set DTC P0841 (81) and often sets P0740 (38)

> Solenoid malfunction - may also set code P0841(81)

> L-R Pressure Switch Sense circuit shorted to battery

> High idle speed

> PRNDL indicates a valid OD code in the hydraulic reverse position

Name of code: P0740(38) - Torque Converter Clutch Control Circuit

When monitored: During Electronically Modulated Converter Clutch (EMCC) Operation

Set condition: The code will be set if one of the following events happens three times in a given key start, at a throttle angle less than 30° a) With the transmission in EMCC, the TCC/L-R solenoid achieves the maximum duty cycle and is still unable to pull the engine speed within 60 RPM of input speed. b) With the transmission in FEMCC, the TCC RPM (Engine speed - Input speed) is more than 100 RPM for 7.2 seconds.

Theory of operation: When in 2nd, 2nd Prime, 3rd, or 4th gear, the torque converter clutch (TCC) can be engaged when certain conditions are met. The TCC piston is electronically modulated by increasing the duty cycle of the L-R solenoid until the torque converter slip difference (difference between engine and transmission input speed) is within 60 RPM. Then the L-R solenoid is fully energized (FEMCC / 100 duty cycle). Torque converter slip is monitored in FEMCC to ensure adequate clutch capacity.

Transmission Effects: EMCC will still be available after code is set. MIL will illuminate after 5 minutes of accumulated slip in FEMCC. The transmission will attempt normal operation (no limp-in) even after the MIL is illuminated.

Possible causes:

> Cut converter hub O-ring and/or failed torque converter - both should be replaced during a rebuild with code P0740(38) present.

> Sticky CC Regulator valve

Name of code: P1776(47) - Solenoid Switch Valve (SSV) Latched in L-R Position

When monitored: Continuously when doing partial or full EMCC (PEMCC or FEMCC)

Set condition: If the transmission senses the L-R pressure switch closing while performing PEMCC or FEMCC. This code will be set after four unsuccessful attempts to perform PEMCC or FEMCC.

Theory of operation: The solenoid switch valve (SSV) controls the direction of the transmission fluid when the L-R solenoid is energized. SSV will be in the downshifted position in 1st gear, thus directing the fluid to the L-R clutch circuits. In 2nd, 3rd, and 4th, the SSV will be in the upshifted position and directs the fluid into the torque converter clutch (TCC). When doing PEMCC or FEMCC, the L-R pressure switch should indicate no pressure if the SSV is in the TCC position. If the L-R pressure switch indicates pressure while in PEMCC or FEMCC, EMCC operation is aborted and inhibited to avoid inadvertent application of the L-R clutch. Partial EMCC will be attempted if the L-R pressure switch does not indicate pressure. Four occurences of detection of L-R pressure results in setting the code.

Transmission Effects: EMCC is inhibited and the transmission system will default to the Orderly Shutdown routine. (this DTC can take up to five minutes of problem identification before illuminating the MIL).

Possible causes:

> Valve body - Solenoid Switch Valve stuck in L-R position

> Intermittent short to ground or open circuit in L-R Pressure Switch Sense circuit (with code P0841 only)

> Solenoid/TRS assembly (with code P0841(81) only)

> TCM (with code P0841(81) only)

Name of Code: P1793(48) - Torque Reduction (TRD) Link Communication Error

When Monitored: During torque managed shifts (Throttle angle above 54 degrees). This system is also tested whenever the vehicle is stopped and the engine speed is below 1000 RPM.

Set condition: This code is set when the Transmission Control Module (TCM) sends two subsequent torque reduction messages to the Powertrain Control Module (PCM) via the TRD link circuit and does not receive a confirmation from the PCM over the communication bus.

Theory of Operation: During high torque shifts the TCM will send a message requesting that the PCM reduce engine power until the shift is completed. This message is sent from the TCM to the PCM across the Torque Management Request Sense Circuit. The PCM will acknowledge the TCM request by sending a confirmation message across the communication bus. The TRD Link communication is also tested periodically for operation whenever the engine is running and the vehicle is not moving with zero degrees throttle.

Transmission Effects: Maximum throttle angle used by TCM will be 54 degrees. As a result a customer may complain about loss of performance, short shifting when driving aggressively, and/or normal shifting and WOT shifts may be harsh.

Possible Causes:

> Sticky Throttle Position Sensor (TPS)

> Wiring or Connector problems in the Torque Management Request Sense Circuit

> Bus communication problems.

> PCM

> TCM

Name of code:

P0736(50) - Gear Ratio Error in Reverse
P0731(51) - Gear Ratio Error in 1st
P0732(52)- Gear Ratio Error in 2nd
P0733(53) - Gear Ratio Error in 3rd
P0734(54) - Gear Ratio Error in 4th
P1736(55) - Gear Ratio Error in 2nd Prime
P0715(56) - Input Speed Sensor
P0720(57) - Output Speed Sensor
P1794(58) - Speed Sensor Ground
P0735(59) - Gear Ratio Error in 4th Prime

When monitored: The transmission gear ratio is monitored continuously while the transmission is in gear.

Set condition: This code is set if the gear ratio is not correct for the current gear.

– Codes 50 through 59 sets if the ratio of the input RPM (Nt) to the output RPM (No) does not match the current gear ratio.

– Code 56 sets if there is an excessive change in input RPM in any gear

– Code 57 sets if there is an excessive change in output RPM in any gear

– Code 58 sets after a TCM reset in neutral and Nt/No equals a ratio of input to output of 2.00

Theory of operation: The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

1. When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding in-gear trouble code is set (codes 50 through 59).
2. An excessive change in input or output speeds indicating signal intermittent will result in codes 56 and/or 57 being set.
3. If the common speed sensor ground circuit is lost, both sensor inputs will read the signal from the input speed sensor at idle in neutral. Since the input speed sensor has 60 teeth and the output speed sensor has 30 teeth, this results in a ratio of 2.00.

Transmission Effects: If a gear ratio error develops, the appropriate code is set as a one trip failure and the 5 minute Intelligent Recovery Timer (IRT) is started. The transmission will then substitute a 1-3 or 3-1 shift to a different gear for the one in which the problem was identified. For example, if a problem is identified while in first gear, the transmission will shift to third gear. The IRT is only counting up while the transmission is substituting one gear for another. Using the previous example, if the vehicle continued down the road and shifted to fourth gear for a long period of time, the IRT would have only counted the time that the transmission was in third gear instead of second. The MIL will illuminate (this DTC can take up to five minutes of problem identification before illuminating the MIL). The transmission system will default to the Logical Shutdown without Recovery routine after 5 minutes of substituted gear operation or if three gear ratio error events occur in a given key start.

Possible causes:

Code P0736(50) - Excludes gear train failures which should be obvious upon disassembly

> If code P0944(35) or any line pressure DTC's are set, diagnose these first

> Valve body - #3 check ball

> L-R switch valve sticking - may also set code P0731(51)

> Speed sensor or associated wiring - may also set codes P0731(51), P0715(56), or P0720(57)

> Multi Select Solenoid sticking or leaking

> Failed or slipping L-R clutch - may also set code P0731(51)
– L-R seal leakage (Intermittent no drive or reverse)
– Sticky L-R accumulator seals (Intermittent no drive or reverse)

> Failed reverse clutch (hard code)
– OD/Rev lip seal leakage
– Worn reaction shaft support seal rings

Code P0731(51) - Excludes gear train failures which should be obvious upon disassembly

> If code P0944(35) or any line pressure DTC's are set, diagnose these first

> Valve body - #1, #2, and/or #4 check ball

> L-R switch valve sticking

> Speed sensor or associated wiring - may also set codes P0736(50), P0715(56), or P0720(57)

> Solenoid/TRS assembly (stuck solenoid(s))

> Failed or intermittent slipping UD clutch - may also set P0732(52) or P0733(53)

– UD seal leakage
– Sticky UD accumulator seals - Worn reaction shaft support seal rings

> Failed or slipping L-R clutch - may have code P0736(50)
– L-R seal leakage
– Sticky L-R accumulator seals

Code P0732(52) – Excludes gear train failures which should be obvious upon disassembly

> If code P0944(35) or any line pressure DTC's are set, diagnose these first

> Valve body - #1, #2, #4, #5 and/or #7 check ball

> Solenoid/TRS assembly - may also set codes P0846(54) and/or P0845(A2)

> Failed or slipping 2nd clutch - 2nd clutch seal leakage - Sticky 2nd clutch accumulator seals

> Failed or intermittent slipping UD clutch - may also set code P0731(51) and/or P0733(53)
– UD clutch seal leakage
– Worn input hub bushing
– Sticky UD clutch accumulator seals
– Worn reaction shaft support seal rings

Code P0733(53) - Excludes geartrain failures which should be obvious upon disassembly

> If code P0944(35) or any line pressure DTC's are set, diagnose these first

> Valve body - #1, #2, and/or #6 check ball

> Speed sensor or associated wiring - may also set codes P0736(50), P0715(56), or P0720(57)

> Solenoid/TRS assembly - may also set codes P0871(84) and/or P0870(A4)

> Failed or slipping OD clutch - may also set code P0734(54)
– OD clutch inner and outer lip seal leakage
– Sticky OD clutch accumulator seals
– Worn reaction shaft support seal rings

> Failed or intermittent slipping UD clutch - may also set codes P0731(51) and/or P0732(52)
– UD seal leakage
– Worn input hub bushing
– Sticky UD clutch accumulator seals
– Worn reaction shaft support seal rings

Code P0734(54) – Excludes gear train failures which should be obvious upon disassembly

> If code P0944(35) or any line pressure DTC's are set, diagnose these first

> Valve body - #1, #2, #5 and/or #6 check ball

> Speed sensor or associated wiring - may also set codes P0736(50), P0715(56), or P0720(57)

> Solenoid/TRS assembly - may also set codes P0988(88) and/or P0987(A8)

> Failed or slipping OD clutch - may also set code P0733(53)
– OD clutch inner and outer lip seal leakage
– Sticky OD clutch accumulator seals
– Worn reaction shaft support seal rings

> Failed or intermittent slipping 4th clutch
– 4th clutch seal leakage
– Sticky 4th clutch accumulator seals
– Worn reaction shaft support seal rings

Code P1736(55) - Excludes gear train failures which should be obvious upon disassembly

> If code P0944(35) or any line pressure DTC's are set, diagnose these first

> Valve body - #1, #4 and/or #5 check ball

> Speed sensor or associated wiring - may also set codes P0736(50), P0715(56), or P0720(57)

> Solenoid/TRS assembly - may also set codes P0876(90) and/or P0875(B0)

> Failed or intermittent slipping UD clutch - may also set codes P0731(51) and/or P0732(52)
– UD seal leakage
– Worn input hub bushing
– Sticky UD clutch accumulator seals
– Worn reaction shaft support seal rings

> Failed or intermittent slipping 4th clutch
– 4th clutch seal leakage
– Sticky 4th clutch accumulator seals
– Worn reaction shaft support seal rings

Codes P0715(56) and P0720(57)

> Failed input or output speed sensor

> Shorted or open wiring between TCM and speed sensor(s)

> Connector problems at 60-way TCM connector and/or speed sensor connector(s)

> Transmission Solenoid/TRS Assembly has an internal short to the Speed Sensor Ground circuit (should also set a P1794 and P1799).

Code P1794(58)

> Open or shorted speed sensor ground (speed sensor ground is different from chassis ground)

> Open or shorted Temperature Sensor wiring to TRS

> Transmission Solenoid/TRS Assembly has an internal short to the Speed Sensor Ground circuit

> TRS - Will also set code P1799(74)

> TCM

Code P0735(59) - Excludes gear train failures which should be obvious upon disassembly

> If code P0944(35) or any line pressure DTC's are set, diagnose these first

> These codes may also be set with the DTC - P1790(36), P0846(82), P0871(84), P0845(A2), P0870(A4), perform these diagnostics first.

> Speed sensor or associated wiring - may also set codes P0736(50), P0715(56), or P0720(57)

> Solenoid/TRS assembly (stuck solenoid(s))

> Failed or slipping OD clutch
OD seal leakage

> Failed or slipping 2C clutch
2C seal leakage

Name of Code: P2700, P2701, P2702, 2703, 2704 (60, 61, 62, 63, 64) - Inadequate Element Volume

When Monitored: Whenever the engine is running, the clutch volume is updated during the requested shift.

Set condition:

Note: Transmission temperature must be 43°C (110°F) to update all volumes.

> **P2700** - When the LR volume falls below 16, the LR volume is updated during a 3-1 or 2-1 manual downshift with the TPS angle below 5 degrees.

> **P2701** - When the 2C volume falls below 5, the 2C volume is updated during a 3-2 kickdown with the TPS angle between 10 and 54 degrees.

> **P2702** - When the OD volume falls below 5, the OD volume is updated during a 2-3 upshift with the TPS angle between 10 and 54 degrees.

> **P2703** - When the UD volume falls below 11, the UD volume is updated during a 4-3 kickdown with the TPS angle between 30 and 54 degrees.

> **P2704** - When the 4C volume falls below 30, the 4C clutch volume is updated when doing a 3-4 shift with throttle angle between 10° and 54°. The transmission temperature must be above 43°C (110°F). The clutch volume should be between 30 and 85.

Theory of Operation: The volumes of the transmission fluid needed to apply the friction elements are continuously monitored and learned for adaptive controls. As the clutch friction material wears, the volume of fluid needed to apply the clutch increases. The following are typical clutch volumes, the clutches may be damaged if the volumes are greater or less than the specified below:
2C clutch volume - between 25 and 85
OD clutch volume - between 30 and 100
4C clutch volume - between 30 and 85
UD clutch volume - between 30 and 100

Transmission Effects: These codes usually set with other DTC's, which indicates an internal transmission problem.

Possible Causes:

> Clutch pack clearance out of spec

> Snap ring out of position or broken

> Broken return spring

> Hydraulic leak into clutch circuit with near-zero volume

Name of Code: P1715(65) - Restricted Port in T3 Range

When Monitored: Whenever the Engine is running and the Manual valve is in the T3 range.

Set condition: The code is set if the conditions for a code 47 are present when the manual valve is in the T3 range.

Theory of Operation: The conditions to set a DTC 47 are easily satisfied while in the T3 range. There is no problem with the transmission itself if this code is set.

Transmission Effects: The transmission will go into neutral when this code is set. If the driver puts the shifter in neutral and back to drive, the transmission will operate normally.

Possible Causes:

> Manual linkage out of adjustment, causing T3 range while shifter is in OD.

> Driver resting hand on shift lever while driving, causing T3 range.

Name of Code: P1799(74) - Calculated Oil Temp in Use

When Monitored: Whenever the Engine is running.

Set condition: The code is set if any of the following conditions exist for three consecutive key starts:

> The Temperature Sensor voltage is out of range (below 0.07 volts or greater than 4.94 volts)

> Continuous erratic Temperature Sensor voltage is sensed.

> The Temperature Sensor temperature stays below 27°C (80°F) for an extended period of time.

Theory of Operation: The TCM uses a Temperature Sensor to monitor the transmission's sump temperature. This temperature is used to determine which shift schedule the TCM is to use. If the Temperature Sensor circuit fails to operate properly the TCM will use the calculated oil temperature routine found in prior model year TCM's. If this occurs for three consecutive key starts, the code will be set. The TCM will then test the Temperature Sensor circuit after every 35th OBDII/EUROIII warm-up start. If the Temperature Sensor circuit is OK, the Temperature Sensor data is used in place of the Calculated Oil Temperature Routine.

Transmission Effects: If the Temperature Sensor indicates a temperature below -18°C (0°F) or above

116°C (240°F) at start up, the TCM compares the calculated oil temperature to the indicated oil temperature. If the calculated oil temperature differs significantly from the Temperature Sensor value, the calculated oil temperature will be used for that key start. This code does not cause the transmission to go into limp-in mode.

Possible Causes:

- > Transmission temperature sensor signal circuit short to ground, short to voltage, or open circuit.
- > Speed sensor ground circuit shorted to ground, shorted to voltage, or open circuit.
- > Temperature Sensor
- > TCM

Name of Code: **P0218(75) - High Temperature Operation Activated**

When Monitored: Whenever the engine is running.

Set Condition: Immediately when the Overheat shift schedule is activated.

Theory of Operation: If the transmission oil temperature rises above 116°C (240°F), the overheat shift schedule is activated, refer to the Transmission Operation as a function of Transmission Oil Temperature. The code is an information code only and is being set to aid the technician in determining root cause of a customer driveability issue. The code is also intended to alert the technician to determine if a cooling system malfunction has occurred or if an additional transmission air to oil cooler should be added to the vehicle if the customer regularly drives in a manner that overheats the transmission. Extended operation above 116°C (240°F) will reduce the durability of the transmission and should be avoided. Correcting the cooling system malfunction or installing an additional transmission oil cooler will improve transmission durability especially for customers who operate in city/construction stop and go traffic, tow trailers regularly, drive aggressively in low gear or drive regularly in mountainous areas.

Transmission Effects: Information only code. - Overheat shift schedule was activated, no limp-in condition occurs. See description of overheat shift schedule.

Possible Causes:

- > Transmission Overfilled with Oil
- > Engine cooling fan failure
- > Engine thermostat stuck closed
- > Radiator corroded or packed with dirt
- > Transmission cooler corroded or packed with dirt
- > Transmission fan not functioning properly
- > Transmission Oil Cooler Plugged
- > Customer driving pattern requires additional transmission cooling

Name Of Code: P0884(76) - Power-Up at Speed

When Monitored: When TCM (Transmission Control Module) initially powers-up.

Set Condition: If the TCM powers up and senses a valid forward gear PRNDL code and the output RPM is above 800 RPM approx. 32 km/h (20 MPH) the code will be set.

Theory of Operation: If a vehicle loses power to the TCM, the solenoids will go to their respective power off state. Some solenoids are normally vented and some are normally applied in their power off state. The transmission is designed to be in 3rd gear with all of the solenoids in this state. However, if power is restored, the TCM will power-up and normal operation will be restored.

This code identifies that power to the TCM was restored when the gear selector was in a ″Drive″ position while the vehicle was moving at speeds above 32 km/h (20 MPH). This code does not indicate a problem with the transmission or TCM, instead, it suggests intermittent problems in the fused ignition switch output, fused B(+), or ground circuits to the TCM. Alternately, if a person performs a rolling restart maneuver, the code can be set. Therefore it is critical that this DTC be investigated if the vehicle is experiencing intermittent 3rd gear operation and a subsequent return to normal operation.

Transmission Effects: No limp-in, although the symptom might be described as an intermittent limp-in. Code is for information only when trying to diagnosis intermittent 3rd gear operation and a subsequent return to normal operation.

Possible Causes:

- > No Problem if vehicle is started in ″neutral″ at speeds above 32 km/h (20 MPH) and shifted quickly to a forward gear position.
- > Quick key off then on while driving is any forward gear.

FOR INTERMITTENT 3rd GEAR OPERATION AND THEN A SUBSEQUENT RETURN TO NORMAL OPERATION WITHOUT CYCLING THE IGNITION KEY

- > Intermittent Direct Battery (Fused B(+)) connection between TCM (60-way pin 56) and battery.
- > Intermittent Fused Ignition Switch Output between TCM (60-way pin 11) and ignition switch.
- > Intermittent Ground to TCM (60 way pins 53 and 57).

Name of code: P0890(80) - Switched Battery

When monitored: Ignition key is turned from ″off″ position to ″run″ position and/or ignition key is turned from ″crank″ position to ″run″ position.

Set condition: This code is set if the Transmission Control Module (TCM) senses voltage on any of the pressure switch inputs prior to the TCM energizing the relay.

Theory of operation: The Transmission control relay is used to supply power to the solenoids and pressure switches when the transmission is in normal operating mode. When the relay is off, no power is supplied and the transmission is in "limp-in" mode. The relay output is fed back to the TCM through pins 16, 17 and 38. It is referred to as "Transmission Control Relay Output".

Immediately after a controller reset (ignition key turned to the "run" position or after cranking engine), the TCM verifies that the relay contacts are open by checking for no voltage at the transmission control relay output terminals. After this is verified, the voltage at the pressure switches is checked. There should be no voltage on the pressure switches at this time. The TCM will then activate the relay.

Transmission Effects: The MIL will illuminate and the transmission system will default to the Immediate Shutdown routine.

Possible causes:

> Short to battery on one or more pressure switch sense circuits.

> TCM connector problems.

> Solenoid/TRS connector problems.

> TCM.

Name of code:

P0841(81) - LR Pressure Switch Sense Circuit
P0846(82) - 2C Pressure Switch Sense Circuit
P0871(84) - OD Pressure Switch Sense Circuit
P0988(88) - 4C Pressure Switch Sense Circuit
P0876(90) - UD Pressure Switch Sense Circuit

When monitored: Whenever the engine is running.

Set condition: The appropriate code is set if one of the pressure switches are open or closed at the wrong time in a given gear (see chart below).

Theory of operation: The Transmission system uses five pressure switches to monitor the fluid pressure in the LR, 2C, 4C, UD, and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown below.

OP = switch is open (No Pressure)
CL = switch is closed (Pressure Indicated)
*LR pressure switch opens above 150 output RPM in 1st gear and closes below a 100 output RPM.

Transmission Effects: The MIL will illuminate and the transmission system will default to the Immediate shutdown routine.

45RFE/545RFE NORMAL PRESSURE SWITCH STATES

GEAR	L/R	2C	4C	UD	OD
R	OPEN	OPEN	OPEN	OPEN	OPEN
N	CLOSED	OPEN	OPEN	OPEN	OPEN
1ST	CLOSED	OPEN	OPEN	CLOSED	OPEN
2ND	OPEN	CLOSED	OPEN	CLOSED	OPEN

3RD	OPEN	OPEN	OPEN	CLOSED	CLOSED
4TH	OPEN	CLOSED	CLOSED	OPEN	CLOSED
4 PRIME	OPEN	OPEN	OPEN	OPEN	CLOSED

80b38409

Possible causes:

> If code P0944(35) is present, perform code P0944(35) diagnostic procedures

> Transmission fluid filter improperly installed (Seal installed onto filter neck instead of into pump bore, seal not fully seated against pump bore housing, filter neck not engaged into pump, bolts loose or O-ring missing or damaged)

> Reverse carrier snap ring dislodged (typically sets on heavy throttle acceleration from a dead stop)

> Pressure switch sense circuit open or shorted to ground between TCM and Solenoid/TRS assembly

> Pressure switch sense circuit shorted to battery

> Pressure switch

> Loose valve body bolts

> Plugged filter - internal transmission or torque converter failure

> Check ball not seating.

> Solenoid malfunction (If set with corresponding Solenoid DTC. Ie: 2C Pressure switch set with 2C solenoid)

> Oil Pump (Code P0841(81) only)

> TCM

Name of code:

P0845(A2) - 2C Hydraulic Pressure test failure
P0870(A4) - OD Hydraulic Pressure test failure
P0987(A8) - 4C Hydraulic Pressure test failure
P0875(B0) - UD Hydraulic Pressure test failure

When monitored: In any forward gear with engine speed above 1000 RPM shortly after a shift and every minute thereafter.

Set condition: Immediately after a shift into a forward gear, with engine speed above 1000 RPM, the TCM momentarily turns on element pressure to the clutch circuits that do not have pressure to identify that the appropriate pressure switch closes. If the pressure switch does not close it is tested again. If the switch does not close the second time, the appropriate code is set.

Theory of operation: The Transmission Control Module (TCM) tests the pressure switches when they are off. The test verifies that the switches are operational (They will close with pressure applied). The TCM verifies that the switch closes when the corresponding element is applied. If a switch fails to close, it is re-tested. If it fails the second test, the code is set.

Transmission Effects: The MIL will illuminate and the transmission system will default to the orderly Shutdown routine Possible causes:

> Line Pressure Sensor

> Pressure switch sense circuit shorted to battery between TCM and solenoid/TRS assembly.

> Solenoid malfunction (If set with corresponding Solenoid DTC. Ie: 2C Hydraulic Pressure switch set with 2C solenoid)

> Low oil pressure

> Pressure switch

Name of code:

P0750(C1) - LR Solenoid Circuit
P0755(C2) - 2C Solenoid Circuit
P0760(C3) - OD Solenoid Circuit
P0770(C4) - 4C Solenoid Circuit
P0765(C5) - UD Solenoid Circuit
P2706(C6) - MS Solenoid Circuit

When monitored: Initially at power-up, then every 10 seconds thereafter. They will also be tested immediately after a gear ratio or pressure switch error is detected.

Set condition: Three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error.

Theory of operation: Six solenoids are used to control the friction elements (clutches). The continuity of the solenoid circuits are periodically tested. Each inactive solenoid is turned on for a few milliseconds, then off. Each active solenoid is turned off for a few milliseconds, then on. This pulsing of voltage to the solenoid causes an inductive spike which can be sensed by the TCM. If an inductive spike is not sensed by the Transmission Control Module (TCM) during the continuity check, it is tested again. If the test fails three consecutive times, the appropriate code is set. If the solenoid test is run in response to a gear ratio or pressure switch error, one failure will result in setting the appropriate code.

Transmission Effects: The MIL will illuminate and the transmission system will default to the Immediate Shutdown routine.

Possible causes:

> Open or shorted solenoid circuit(s) between TCM and solenoid/TRS assembly.

> Open ground circuit.

> TCM connector problems.

> Solenoid/TRS connector problem.

> Solenoid/TRS assembly.

> TCM

Name of code:

P0867(C8) - Line Pressure Fault
P0868(C9) - Line Pressure Low
P0869(CB) - Line Pressure High

When monitored: Continuously with engine running.

Set condition: The TCM has an internal error counter for each DTC above. When any of the counters reaches a preset threshold, the appropriate code is set.

Theory of operation: Line pressured is controlled by the TCM. It is measured by the Line Pressure Sensor (LPS) and regulation is achieved by changing the duty cycle of the Pressure Control Solenoid (PCS). (5% duty cycle = solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure). The TCM calculates the desired line pressure based on inputs from the transmission and engine. The TCM calculates torque input to the transmission and uses it as the primary input to the desired line pressure calculation. This is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 or 931 kPa (120 or 135 PSI) during shifts and in Park and Neutral to ensure consistent shift quality. The desired line pressure is continuously being compared to the actual line pressure. If the actual line pressure is consistently higher than the target, the line pressure high DTC P0869(CB) will be set. If the actual line pressure is consistently lower than the target, the line pressure low DTC P0868(C9) will be set. If it is consistently out of range, but not consistently high or low, it is considered out of range and the line pressure error DTC P0867(C8) will be set.

Transmission Effects: The Transmission system will default to open loop line pressure control resulting in a fixed PCS duty cycle. This duty cycle will change slightly depending on temperature and current gear. Possible causes:

> Sticking Regulator Valve

> Pressure Control Solenoid

> Line Pressure Sensor.

> Oil pump

> Plugged Filter

> 5V supply circuit to Line Pressure Sensor open (Sensor reading will read a constant value between 586 and 655 kPa (85 and 95 PSI)

> TCM

Name of code:

P0932(CA) - Line Pressure Sensor Fault

When monitored: Continuously with engine running.

Set condition: If the Line Pressure Sensor (LPS) voltage is below 0.35 volts or above 4.75 volts the code will be set.

Theory of operation: Line pressured is controlled by the TCM. It is measured by the LPS and regulation is achieved by changing the duty cycle of the Pressure Control Solenoid (PCS) (5% duty cycle = solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure). This sensor is continuously checked for out of range voltage by the TCM.

Transmission Effects: The Transmission system will default to open loop line pressure control resulting in a fixed PCS duty cycle. This duty cycle will change slightly depending on temperature and current gear.

Possible causes:

> LPS signal circuit shorted to ground, shorted to voltage, or open.

> 5-volt supply circuit shorted to ground, shorted to voltage, or open.

> Open sensor ground

> Line Pressure Sensor

3.3.8 QUICK LEARN

The Quick Learn function customizes adaptive parameters of the TCM to the transmission characteristics of a vehicle. This gives the customer improved ″as received″ shift quality compared to the initial parameters stored in the TCM.

Notes about Quick Learn Features

The nature of the Quick Learn function requires that certain features must be taken into consideration.

> Quick Learn should generally not be used as a repair procedure unless directed by a repair or diagnostic procedure. If the transmission system is exhibiting a problem that you think is caused by an invalid CVI, you should try to relearn the value by performing the appropriate driving maneuver. In most cases, if a Quick Learn makes a vehicle shift better, the vehicle will return with the same problem.

> Before performing Quick Learn, it is imperative that the vehicle be shifted into OD with the engine running and the oil level set to the correct level. This step will purge air from the clutch circuits to prevent erroneous clutch volume values which could cause poor initial shift quality. Cycle the transmission through all gears 2-3 times immediately before performing Quick Learn. For best results, Quick Learn should be run with the transmission sump temperature > 90°F.

> If an unused TCM is installed on a vehicle with a HOT engine, Quick Learn will cause the TCM to report a cold calculated oil temperature. This requires monitoring the calculated oil temperature using the DRBIII®. If the temperature is below 16°C (60°F), the transmission must be run at idle or driven in gear until it goes above 16°C (60°F). If the temperature is above 93°C (200°F), the transmission must cool to below 93°C (200°F).

> First gear is engaged in overdrive after Quick Learn is completed. Place the vehicle in park after performing Quick Learn.

The Quick Learn function should be performed:

– Upon installation of a new service TCM

– After replacement or rebuild of internal transmission components or the torque converter

– If one or more of the clutch volumes indexes (CVI's) contain skewed readings because of abnormal conditions.

The Quick Learn procedure is performed with the DRBIII® by selecting ″Transmission″ system then ″Miscellaneous″ functions, then ″Quick Learn″. Follow the procedure instructions displayed on the DRBIII®.

To perform the Quick Learn procedure, the following conditions must be met.

NOTE: The oil temperature must be between 16°C (60°F) and 93°C (200°F). above 32°C (90°F) for best results. Cycle the transmission through all gears 2-3 times immediately before performing Quick Learn.

– It is imperative that the vehicle oil level set to the correct level. Shift the transmission into OD with the engine running, this step will purge the air in the clutch circuits to prevent erroneous clutch volume values, which could cause poor initial shift quality.

– Shift the transmission to neutral.

– The brakes must be applied.

– The engine must be idling.

– The throttle angle (TP sensor) must be less than 3 degrees.

– The shift lever position must stay in neutral, after shifting to neutral the engine idle speed will ramp up to 1600rpm and the DRBIII®

will prompt the operator to shift to OD. Do not shift to OD until the engine idle speed stabilizes at 1600rpm.

– The shift lever must stay in OD after the ″Shift to Overdrive″ prompt until the DRBIII® indicates the procedure is complete.

NOTE: The above conditions must be maintained during the procedure to keep the procedure from being aborted.

NOTE: After the Quick Learn Procedure is complete, the vehicle should be drive learned per the Drive Learn Procedure

3.3.9 CLUTCH VOLUMES

The LR clutch volume is updated when doing a **manual** downshift into 1st gear with vehicle speed above 40 km/h (25 MPH) and throttle angle below 5°. The transmission temperature must be above 43°C (110°F).

The clutch volume should be between 45 and 134.

NOTE: You must manually move the shift lever into the low position.

The 2C clutch volume is updated when doing a 3-2 shift with throttle angle between 10° and 54°. The transmission temperature must be above 43°C (110°F). The clutch volume should be between 25 and 85.

The 2CA clutch volume is updated when doing a 4th-4 prime shift with throttle angle between 10° and 54°. The transmission temperature must be above 43°C (110°F). The clutch volume should be between 25 and 85.

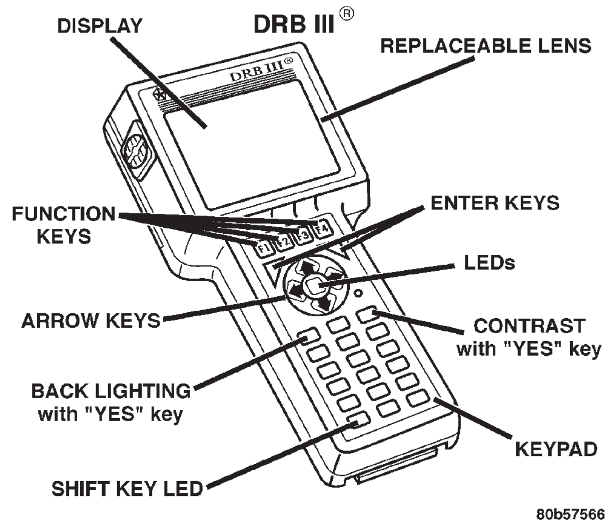
The OD clutch volume is updated when doing a 2-3 shift with throttle angle between 10° and 54°. The transmission temperature must be above 43°C (110°F). The clutch volume should be between 30 and 100.

The 4C clutch volume is updated when doing a 3-4 shift with throttle angle between 10° and 54°. The transmission temperature must be above 43°C (110°F). The clutch volume should be between 30 and 85.

The UD clutch volume is updated when doing a 4-3 shift with throttle angle between 10° and 54°. The transmission temperature must be above 43°C (110°F). The clutch volume should be between 30 and 100.

3.4 USING THE DRBIII®

Refer to the DRBIII® user's guide for instructions and assistance with reading trouble codes, erasing trouble codes, and other DRBIII® functions.



3.5 DRBIII® ERROR MESSAGES

Under normal operation, the DRBIII® will display one of only two error messages:

– User-Requested WARM Boot

– User-Requested COLD Boot If the DRBIII® should display any other error message, record the entire display and call the S.T.A.R. Center.

3.5.1 DRBIII® DOES NOT POWER UP (BLANK SCREEN)

If the LED's do not light or no sound is emitted at start up, check for loose cable connections or a bad cable. Check the vehicle battery voltage. A minimum of 11 volts is required to adequately power the DRBIII®.

If all connections are proper between the DRBIII® and the vehicle or other devices, and the vehicle battery is fully charged, an inoperative DRBIII® may be the result of faulty cable or vehicle wiring. For a blank screen, refer to the appropriate Body Diagnostic manual.

3.5.2 DISPLAY IS NOT VISIBLE

Low temperatures will affect the visibility of the display. Adjust the contrast to compensate for this condition.

3.5.3 SOME DISPLAY ITEMS READ ″---″

This is caused by the scrolling the DRBIII® display a single line up or down. The line which was scrolled onto the screen might read ″---″. Use the page down or page up function to display the information.

3.6 TRANSMISSION SIMULATOR (MILLER TOOL # 8333)

NOTE: Remove the starter Relay when using the transmission simulator - Failure to remove the Starter Relay can cause a TCM - No Response condition.

NOTE: The Transmission Simulator will not accurately diagnose an intermittent fault.

The transmission simulator, simply put, is an electronic device that simulates the electronic functions of any EATX controlled transmission (41TE, 42LE, and 45RFE/545RFE). It's basic function is to aid the technician in determining if an internal transmission problem exists or if the problem resides in the vehicle wiring or Transmission Control Module (TCM). It is only useful for electrical problems. It will not aid in the diagnosis of a failed mechanical component, but it can tell you that the TCM and wiring are working properly and that the problem is internal.

The ignition switch should be in the lock position before attempting to install the simulator. Follow all instructions included with the simulator. If the feedback from the simulator is in doubt, you can verify it's operation by installing it on a known good vehicle. A ″known good vehicle″ would be defined as a vehicle that does not set any DTC's and drives and shifts as expected. One important point to remember is that the Simulator receives it's power from the Trans Relay Output circuit. If the transmission system is in Limp-in (Relay open), the simulator will not operate. This is not really an indication of a problem, but an additional symptom. If the simulator does not power up (″P″ led lit), this is an indication that the problem is still present with the simulator hooked up. This indicates that the problem is in the wiring or TCM and not the transmission.

4.0 DISCLAIMERS, SAFETY, AND WARNINGS

4.1 DISCLAIMERS

All information, illustrations, and specifications contained in this manual are based on the latest information available at the time of publication. The right is reserved to make changes at any time without notice.

4.2 SAFETY

4.2.1 TECHNICIAN SAFETY INFORMATION

WARNING: ENGINES PRODUCE CARBON MONOXIDE THAT IS ODORLESS, CAUSES SLOWER REACTION TIME, AND CAN LEAD TO SERIOUS INJURY. WHEN THE ENGINE IS OPERATING KEEP SERVICE AREAS WELL VENTILATED OR ATTACH THE VEHICLE EXHAUST SYSTEM TO THE SHOP EXHAUST REMOVAL SYSTEM.

Set the parking brake and block the wheels before testing or repairing the vehicle. If is especially important to block the wheels on front-wheel drive vehicles: the parking brake does not hold the drive wheels.

Some operations in this manual require that hydraulic tubes, hoses, and fittings, disconnected for inspection or testing purposes. These systems, when fully charged, contain fluid at high preessure. Before disconnecting any hydraulic tubes, hoses, and fittings, be sure that the system is fully depressurized.

When servicing a vehicle, always wear eye protection, and remove any metal jewelry such as watchbands or bracelets that might make an inadvertent electrical contact. When diagnosing a Transmission system problem, it is important to follow approved procedures where applicable. These procedures can be found in the service information. Following these procedures is very important to the safety of individuals performing diagnostic tests.

4.2.2 VEHICLE PREPARATION FOR TESTING

Make sure the vehicle being tested has a fully charged battery. If it does not, false diagnostic DTC's or error messages may occur. It is extremely important that accurate shift lever position data is available to the TCM. The accuracy of any DTC found in memory is doubtful unless the Shift Lever Test, performed on the DRBIII® Scan Tool, passes without failure.

4.2.3 SERVICING SUB-ASSEMBLIES

Some components of the Transmission system are intended to be serviced in assembly only. Attempting to remove or repair certain system subcomponents may result in personal injury and/or improper system operation. Only those components with approved repair and installation procedures in the service information should be serviced.

4.2.4 DRBIII® SAFETY INFORMATION

WARNING: EXCEEDING THE LIMITS OF THE DRBIII® MULTIMETER IS DANGEROUS. IT CAN EXPOSE YOU TO SERIOUS OR POSSIBLY FATAL INJURY. CAREFULLY READ AND UNDERSTAND THE CAUTIONS AND THE SPECIFICATION LIMITS.

- Follow the vehicle manufacturer's service specifications at all times.
- Do not use the DRBIII® if it has been damaged.
- Do not use the test leads if the insulation is damaged or if metal is exposed.
- To avoid electrical shock, do not touch the test leads, tips or the circuit being tested.
- Choose the proper range and function for the measurement. Do not try voltage or current measurements that may exceed the rated capacity.
- Do not exceed the limits shown in the table.

FUNCTION	INPUT LIMIT
Volts	0-500 volts peak AC 0-500 volts DC
Ohms (resistance)*	0-1.12 megohms
Frequency measured Frequency generated	0-10 khz
Temperature	-58-1100°F -50-600°C
*Ohms cannot be measured if voltage is present. Ohms can be measured only in a non-powered circuit.	

- Voltage between any terminal and ground must not exceed 500v DC or 500v peak AC.
- Use caution when measured voltage above 25v DC or 25v AC.
- The circuit being tested must be protected by a 10A fuse or circuit breaker.
- Use the low current shunt to measure circuits up to 10A. Use the high current clamp to measure circuits exceeding 10A.
- When testing for the presence of voltage or current, make sure the meter is functioning correctly. Take a reading of a known voltage or current before accepting a zero reading.
- When measuring current, connect the meter in series with the load.
- Disconnect the live test lead before disconnecting the common test lead.
- When using the meter function, keep the DRBIII® away from spark plug or coil wires to avoid measuring error from outside interference.

4.3 WARNINGS

4.3.1 VEHICLE DAMAGE WARNINGS

Before disconnecting any control module, make sure the ignition is "lock" position. Failure to do so could damage the module. When testing voltage or continuity at any control module, use the terminal side (not the wire end) of the connector. Do not probe a wire through the insulation: this will damage the wire and eventually cause the wire to fail because of corrosion. Be careful when performing electrical tests so as to prevent accidental shorting of terminals. Such mistakes can damage fuses or components. Also, a second DTC could be set, making diagnosis of the original problem more difficult. When replacing a blown fuse, it is important to use only a fuse having the correct amperage rating. The use of a fuse with a rating other than indicated may result in a dangerous electrical system overload. If a properly rated fuse continues to blow, it indicates a problem in the circuit that must be corrected.

4.3.2 ROAD TESTING A COMPLAINT VEHICLE

Some complaints will require a test drive as part of the repair verification procedure. The purpose of the test drive is to try to duplicate the diagnostic DTC or symptom condition.

CAUTION: Before road testing a vehicle, be sure that all components are reassembled. During the test drive, do not try to read DRBIII® screen while in motion. Do not hang the DRBIII® from the rear view mirror or operate it yourself. Have an assistant available to operate the DRBIII®.

Road testing is an essential step in the diagnostic process that must not be overlooked. Along with the diagnostic information obtained from the DRBIII® Scan Tool and the original customer concern, the road test helps verify the problem was current and any repairs performed, fixed the vehicle correctly. Always operate and observe the vehicle under actual driving conditions.

Just as important as the road test is, there are preliminary inspections that should be performed prior to the road test. Always check the fluid level and condition before taking the vehicle on a road test. Determine if the incorrect fluid is being used, improper fluid will result in erratic transmission operation. Some of the conditions of incorrect fluid level are as follows:

- Delayed engagement
- Poor shifting or erratic shifting
- Excessive noise
- Overheating

The next step is to verify that the shift linkage is correctly adjusted. If the shift linkage is incorrectly adjusted, a number of complaints can result.

The TCM monitors the Shift Lever Position (SLP) Sensor continuously. If the linkage is incorrectly adjusted, the TCM will sense a shift lever position that is not correct for the gear chosen by the driver. This may cause a DTC to be set. The following complaints may also be the result of an incorrectly adjusted or worn linkage:

- Delayed clutch engagement
- Erratic shifts
- Vehicle will drive in neutral
- Engine will not crank in park or neutral
- Gear shift linkage will be able to be shifted without the key in the ignition
- Not able to remove the ignition key in park
- Parking pawl will not engage properly

The shift linkage should also be adjusted when replacing the Transmission, repairing the valve body, or when repairing any component between the shift lever and the Transmission.

Some questions to ask yourself when performing the road test are as follows:

- Is the complaint or concern what you think the problem is, based on the drivers description of the problem?
- Is the Transmission operating normally, or is there a real problem?
- When does the problem occur?
- Is the problem only in one gear range?
- What temperature does the problem occur?
- Does the vehicle have to sit over night for the problem to occur?
- Does the transmission go into Limp-in mode?

4.3.3 ELECTRONIC PINION FACTOR WARNINGS (IF APPLICABLE)

The pinion factor must be set when replacing the TCM. Note: The pinion factor is a fixed number and cannot be changed or updated in some vehicle applications. If the pinion factor is not set or incorrectly set, any speed related functions will not operate correctly i.e. speedometer, speed control, rolling door locks, other control modules will be affected that depend on speed information.

4.4.4 BULLETINS AND RECALLS

Always perform all Safety Recalls and Technical Service Bulletins that are applicable to the problem.

5.0 REQUIRED TOOLS AND EQUIPMENT

> DRBIII® (diagnostic read-out box) - DRBIII® must use the latest release level.
> Transmission Simulator (Miller # 8333)
> Line Pressure Adapter (Miller #8259)
> Jumper wires
> Test Light
> Ohmmeter
> Voltmeter
> Pressure gauge 0-2068 kPa (0-300 PSI)

6.0 GLOSSARY OF TERMS

6.1 ACRONYMS

CKT	Circuit
CVI	Clutch Volume Index
DLC	Data Link Connector
DRBIII®	Diagnostic Readout Box
DTC	Diagnostic Trouble Code
EATX	Electronic Automatic Transmission
EMCC	Electronically Modulated Converter Clutch
FEMCC	Full Electronically Modulated Converter Clutch
IOD	Ignition off-draw
IRT	Intelligent Recovery Timer
ISS	Input Speed Sensor
LED	Light Emitting Diode
LPS	Line Pressure Sensor
LR	Low/reverse Clutch
MIL	Malfunction Indicator Lamp
MS	Multi Select
OBD	On Board Diagnostics
OD	Overdrive Clutch

OSS	Output Speed Sensor
PCI	Programmable Controller Interface (Vehicle bus system)
PCM	Powertrain Control Module
PCS	Pressure Control Solenoid
PEMCC	Partial Electronically Modulated Converter Clutch
REV	Reverse Clutch
SSV	Solenoid Switch Valve
SW	Switch
TCC	Torque Converter Clutch
TCCM	Transfer Case Control Module
TCM	Transmission Control Module
TP	Throttle Position
TRD	Torque Reduction
TRS	Transmission Range Sensor
TTS	Transmission Temperature Sensor
UD	Underdrive Clutch
2C	2nd Clutch
4C	4th Clutch

6.2 DEFINITIONS

OBDII/EURO III Trip - A vehicle start and drive cycle such that all once per trip diagnostic monitors have run.
Key Start - A vehicle start and run cycle of at least 20 seconds.
Warm-up Cycle - A vehicle start and run cycle such that the engine coolant must rise to at least 71°C (160°F) and must rise by at least 22°C (40°F) from initial startup. To count as a warm-up cycle, no DTC's may occur during the cycle.

7.0

DIAGNOSTIC INFORMATION AND PROCEDURES

Symptom:
*NO RESPONSE FROM TRANSMISSION CONTROL MODULE - GAS ONLY

POSSIBLE CAUSES
NO RESPONSE FROM TRANSMISSION CONTROL MODULE
FUSED IGNITION SWITCH OUTPUT (RUN/ST) CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT (START) CIRCUIT OPEN
FUSED B(+) CIRCUIT OPEN
GROUND CIRCUIT(S) OPEN
OPEN PCI BUS CIRCUIT
TRANSMISSION CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. **Note: As soon as one or more module communicates with the DRB, answer the question.** With the DRB, attempt to communicate with the Airbag Control Module (ACM). With the DRB, attempt to communicate with the Body Control Module (BCM). Was the DRB able to I/D or establish communications with either of the modules? Yes → Go To 2 No → Refer to the Body Communication category and perform the symptom PCI Bus Communication Failure. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	All
2	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Fused Ignition Switch Output (Run/St) circuit. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 3 No → Repair the Fused Ignition Switch Output (Run/St) circuit for an open. Refer to the wiring diagrams location in the Service Information. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	All

*NO RESPONSE FROM TRANSMISSION CONTROL MODULE - GAS ONLY — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Remove the starter relay from the PDC. Using a 12-volt test light connected to ground, check the Fused Ignition Switch Output (Start) circuit. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Observe the test light while momentarily turning the ignition switch to the Start position. Does the test light illuminate brightly? Yes → Go To 4 No → Repair the Fused Ignition Switch Output (Start) circuit for an open. Refer to the wiring diagrams located in the Service Information. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. **Note: Reinstall the original Starter Relay.**	All
4	Turn the ignition off. Disconnect the TCM harness connector. Using a 12-volt test light connected to ground, check the Fused B(+) circuit. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 5 No → Repair the Fused B(+) circuit for an open. Refer to the wiring diagrams located in the Service Information. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	All
5	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Using a 12-volt test light connected to 12-volts, check each ground circuit in the TCM harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly at all the ground circuits? Yes → Go To 6 No → Repair the Ground circuit(s) for an open. Check the main ground connection to engine block and/or chassis. Refer to the wiring diagrams located in the Service Information. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	All

*NO RESPONSE FROM TRANSMISSION CONTROL MODULE - GAS ONLY — Continued

TEST	ACTION	APPLICABILITY
6	**Note: Ensure there is PCI Bus communication with other modules on the vehicle before proceeding. If not, refer to the symptom list from the menu and repair as necessary.** Disconnect the TCM harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII® select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the TCM connector. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Go To 7 No → Repair the PCI Bus circuit for an open. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	All
7	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
P0120-THROTTLE POSITION SENSOR SIGNAL CIRCUIT

When Monitored and Set Condition:

P0120-THROTTLE POSITION SENSOR SIGNAL CIRCUIT

When Monitored: Whenever the engine is running.

Set Condition: The DTC is set if the throttle angle goes out of range or if throttle angle changes abruptly (i.e.: faster than the throttle body motion should occur). Note: This DTC can also be set by repeatedly stabbing the throttle.

POSSIBLE CAUSES
RELATED TPS PCM DTC'S PRESENT
INTERMITTENT WIRING AND CONNECTORS
TPS VOLTAGE CHANGE NOT SMOOTH
SENSOR GROUND CIRCUIT OPEN TO TCM
TPS SIGNAL CIRCUIT OPEN TO TCM
TCM - THROTTLE POSITION CIRCUIT

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing transmission symptom diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSB's related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

P0120-THROTTLE POSITION SENSOR SIGNAL CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, check Powertrain Control Module DTC's. Are any of the DTCs P0122, P0123 or P0121 present? Yes → Refer to the Powertrain category and perform the appropriate symptom. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	5-SPD AUTOMATIC 5-45RFE TRANS
3	With the DRBIII®, check the TPS degree. Is the TPS degree reading below 6° or over 120°? Yes → Go To 4 No → Go To 7	5-SPD AUTOMATIC 5-45RFE TRANS
4	Turn the ignition off to the lock position. Disconnect the TPS harness connector. Disconnect the TCM harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the Sensor Ground circuit between the TPS harness connector and the Transmission Control Module harness connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the open Sensor Ground circuit between the TCM harness connector and the splice. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS
5	Turn the ignition off to the lock position. Disconnect the Throttle Position Sensor (TPS). Disconnect the TCM harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the TPS Signal Circuit from the TCM harness connector to the TPS harness connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the open TPS signal circuit between the TCM harness connector and the splice. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS
6	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS

P0120-THROTTLE POSITION SENSOR SIGNAL CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
7	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. Pay particular attention to the the point where the TPS signal and sensor ground circuits splice off from the engine circuits. Were there any problems found? Yes → Repair wiring and/or connector as necessary. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	5-SPD AUTOMATIC 5-45RFE TRANS
8	Ignition On, Engine Not Running. With the DRBIII®, read the TPS voltage. While monitoring the DRBIII®, slowly open and close the throttle. Is the TPS voltage change smooth? Yes → Test Complete. No → Replace the Throttle Position Sensor. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS

Symptom:
P0218-HIGH TEMPERATURE OPERATION ACTIVATED

When Monitored and Set Condition:

P0218-HIGH TEMPERATURE OPERATION ACTIVATED

When Monitored: Whenever the engine is running.

Set Condition: Immediately when the Overheat shift schedule is activated 116 degrees C transmission oil temp. (240 degrees F. Trans oil temp).

POSSIBLE CAUSES
ENGINE COOLING SYSTEM
TRANSMISSION OIL PUMP FLOW
HIGH TEMPERATURE OPERATIONS ACTIVATED

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing transmission symptom diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSB's related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	Perform the Oil Pump Flow test per the Service Information. Did the Oil Pump Flow test pass? Yes → Go To 3 No → Repair the cause of either a low, or no Transmission Oil Pump Flow. Refer to the Service Information for the proper repair procedure. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS

P0218-HIGH TEMPERATURE OPERATION ACTIVATED — Continued

TEST	ACTION	APPLICABILITY
3	Perform Engine Cooling System diagnostics per the Service Information. Is the Engine Cooling System functioning properly? Yes → Go To 4 No → Repair the cause of the engine overheating. Refer to the Service Information for the proper repair procedure. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS
4	This DTC is an informational DTC designed to aid the Technician in diagnosing shift quality complaints. This DTC indicates that the transmission has been operating in the "Overheat" shift schedule which may generate a customer complaint. The customer driving patterns may indicate the need for an additional transmission oil cooler. If there are no possible causes remaining, view repair. Repair Repair the cause of transmission overheating. Refer to the Service Information for the proper repair procedure. Make sure to check for any TSBs pertaining to this problem. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS

Symptom:
P0604-INTERNAL TCM

When Monitored and Set Condition:

P0604-INTERNAL TCM

When Monitored: Continuously with the key on.

Set Condition: When ever the TCM detects an internal controller problem.

POSSIBLE CAUSES
TCM INTERNAL ERROR

TEST	ACTION	APPLICABILITY
1	If there are no possible causes remaining, view repair. Repair The Transmission Control Module is reporting internal errors and must be replaced. WITH THE DRBIII® PERFORM QUICK LEARN. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS

Symptom:
P0605-INTERNAL TCM

When Monitored and Set Condition:

P0605-INTERNAL TCM

P0706-CHECK SHIFTER SIGNAL — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off to the lock position. Remove the Starter Relay from the PDC. **NOTE: Failure to remove the Starter Relay can cause a TCM - No Response condition.** Install Transmission Simulator Miller tool #8333. Ignition on, engine not running. With the DRBIII®, perform the Shift Lever Position Test. When the DRBIII® instructs you to put the Gear Selector in a particular position, you must do so using the selector switch on the Transmission Simulator. The LED for the gear position in question must be illuminated on the Transmission Simulator prior to pressing "ENTER" on the DRBIII®. **NOTE: When the DRBIII® requests the O/D off button be depressed, you must use the O/D OFF button in the vehicle or you will fail the Shift Lever Position Test with a DTC P0613 (11).** Did the Shift Lever Position test pass? Yes → Go To 5 No → Go To 6 **NOTE: Make sure to disconnect the Transmission Simulator and reconnect all disconnected connectors before proceeding.**	5-SPD AUTO-MATIC 5-45RFE TRANS
5	If there are no possible causes remaining, view repair. Repair Replace the Transmission Solenoid/TRS Assembly per the Service Information. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS
6	With the DRBIII®, observe the TRS sense circuits on the Input/Output screen. (C1 thru C5) Move the shift lever from P to L, pausing momentarily in each gear position. Watch for one of the circuits to not change state. Pick the one that did not change state. TRS T1 sense (C4) Go To 7 TRS T2 sense (C5) Go To 11 TRS T3 sense (C3) Go To 15 TRS T41 sense (C1) Go To 19 TRS T42 sense (C2) Go To 23	5-SPD AUTO-MATIC 5-45RFE TRANS

7	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. Pay particular attention to the point where the CKP Signal circuit and the Sensor Ground circuit splice off from the engine circuits. Were there any problems found? Yes → Repair as necessary. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	5-SPD AUTOMATIC 5-45RFE TRANS

Symptom:
P0731-GEAR RATIO ERROR IN 1ST

When Monitored and Set Condition:

P0731-GEAR RATIO ERROR IN 1ST

When Monitored: The transmission gear ratio is monitored continuously while the transmission is in gear.

Set Condition: If the ratio of the Input RPM to the Output RPM does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES
RELATED DTC'S PRESENT
INTERMITTENT GEAR RATIO ERRORS
INTERNAL TRANSMISSION

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing transmission symptom diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSB's related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

P0731-GEAR RATIO ERROR IN 1ST — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, check for other transmission DTC's If any of these DTC's are present, perform their respective tests first. Are DTC's P0944, P0715, P0720, P1794, P0867, P0932, P0868, or P0869 present also? Yes → Refer to Symptom list for the related symptom(s). If any of these DTCs are present, they will cause a Speed Ratio Error. Perform the test for P0944 first if it is present. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	5-SPD AUTO-MATIC 5-45RFE TRANS
3	With the DRBIII®, perform the 1st Gear Clutch Test. Follow the instructions on the DRBIII®. Increase the throttle angle or TPS Degree to 30°, for no more than a few seconds. **CAUTION: Do not overheat the transmission.** Did the Clutch Test pass, Input Speed remain at zero? Yes → Go To 4 No → Go To 5	5-SPD AUTO-MATIC 5-45RFE TRANS
4	The conditions to set this DTC are not currently present. Check the gearshift linkage adjustment. Intermittent Gear Ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit. Check the speed sensor wiring and connectors for good connection, then perform a wiggle test using the Transmission Simulator, Miller tool # 8333. Remove the Starter Relay from the PDC before using the Transmission Simulator Miller tool # 8333. **NOTE: Failure to remove the Starter Relay can cause a TCM - No Response condition.** Gear ratio DTC's can also be set under extreme temperature conditions, this is usually caused by an internal problem. Verify if the problem is only experienced under extreme hot or cold conditions. Were there any problems found. Yes → Repair as necessary. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	5-SPD AUTO-MATIC 5-45RFE TRANS
5	Repair or replace the transmission as necessary. If the transmission is to be repaired, and there were any line pressure DTC's present along with this DTC, make sure to inspect the Transmission Oil Pump and Pressure Control Solenoid per the Service Information procedures. If DTC's P0876 and/or P0875 were present in addition to the P0731, replace the Transmission Solenoid/TRS Assembly in addition to necessary internal repairs. If there are no possible causes remaining, view repair. Repair Repair internal transmission problem or replace the transmission per the Service Information. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS

Symptom:
P0732-GEAR RATIO ERROR IN 2ND

When Monitored and Set Condition:

P0732-GEAR RATIO ERROR IN 2ND

When Monitored: The transmission gear ratio is monitored continuously while the transmission is in gear.

Set Condition: If the ratio of the Input RPM to the Output RPM does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES
RELATED DTC'S PRESENT
RELATED PRESSURE SWITCH DTC'S PRESENT
INTERMITTENT GEAR RATIO ERRORS
INTERNAL TRANSMISSION

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, check for other transmission DTC's. Are there any Transmission Control Relay related DTC's P0890, P0891, or P0888 present? Yes → Refer to symptom list and perform test for Transmission Relay related DTC's. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	5-SPD AUTOMATIC 5-45RFE TRANS
3	With the DRBIII®, Check the STARTS SINCE SET counter for P0750 **NOTE: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter for P0750 set at 0? Yes → Go To 4 No → Go To 11	5-SPD AUTOMATIC 5-45RFE TRANS
4	Turn the ignition off to the lock position. Remove the Starter Relay from the PDC. **NOTE: Failure to remove the Starter Relay can cause a TCM - No Response condition.** Install Transmission Simulator Miller tool #8333. **Note: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. With the DRBIII®, actuate the L/R Solenoid. Monitor the L/R Solenoid LED on the Transmission Simulator. Did the L/R Solenoid LED on the Transmission Simulator blink on and off? Yes → Go To 5 No → Go To 6	5-SPD AUTOMATIC 5-45RFE TRANS
5	If there are no possible causes remaining, view repair. Repair Replace the Transmission Solenoid/TRS Assembly per the Service Information. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS
6	Turn the ignition off to the lock position. Disconnect the Transmission Solenoid/TRS Assembly harness connector. Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Transmission Control Relay Output circuit in the Transmission Solenoid/TRS Assembly harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 7 No → Repair the Transmission Control Relay Output circuit for an open or high resistance. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS

P0750-LR SOLENOID CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off to the lock position. Disconnect the TCM harness connector Disconnect the Transmission Solenoid /TRS Assembly harness connector **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the L/R Solenoid Control circuit from the TCM harness connector to the Transmission Solenoid/TRS Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the L/R Solenoid Control circuit for an open. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	5-SPD AUTOMATIC 5-45RFE TRANS
8	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/TRS Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the L/R Solenoid Control circuit. Is the resistance below 5.0 ohms? Yes → Repair the L/R Solenoid Control circuit for a short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 9	5-SPD AUTOMATIC 5-45RFE TRANS
9	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/TRS Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector. Ignition on, engine not running. Measure the voltage of the L/R Solenoid Control circuit in the TCM harness connector. Is the voltage above 0.5 volt? Yes → Repair the L/R Solenoid Control circuit for a short to voltage. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 10	5-SPD AUTOMATIC 5-45RFE TRANS
10	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module per the Service Information. WITH THE DRBIII® PERFORM QUICK LEARN. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS

P0750-LR SOLENOID CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
11	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	5-SPD AUTO-MATIC 5-45RFE TRANS

Symptom:
P0755-2C SOLENOID CIRCUIT

When Monitored and Set Condition:

P0755-2C SOLENOID CIRCUIT

When Monitored: Initially at power-up, then every 10 seconds thereafter. They will also be tested immediately after a gear ratio or pressure switch error is detected.

Set Condition: Three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error.

POSSIBLE CAUSES
RELATED RELAY DTC'S PRESENT
INTERMITTENT WIRING AND CONNECTORS
TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN
2C SOLENOID CONTROL CIRCUIT OPEN
2C SOLENOID CONTROL CIRCUIT SHORT TO GROUND
2C SOLENOID CONTROL CIRCUIT SHORT TO VOLTAGE
SOLENOID/TRS ASSEMBLY - 2C SOLENOID
TCM - 2C SOLENOID CIRCUIT

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing transmission symptom diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSB's related to the problem.** Perform this procedure prior to Symptom diagnosis. P0841-LR PRESSURE SWITCH SENSE CIRCUIT

When Monitored and Set Condition:

P0841-LR PRESSURE SWITCH SENSE CIRCUIT

When Monitored: Whenever the engine is running.

Set Condition: The appropriate code is set if one of the pressure switches are open or closed at the wrong time in a given gear .

POSSIBLE CAUSES
LOSS OF PRIME P0944 PRESENT
RELATED RELAY DTC'S PRESENT
INTERMITTENT CONDITIONS
L/R PRESSURE SWITCH SENSE CIRCUIT OPEN
TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN
L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND
L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
L/R PRESSURE SWITCH
TCM - L/R PRESSURE SWITCH

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing transmission symptom diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSB's related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

P0841-LR PRESSURE SWITCH SENSE CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, check for other Transmission DTC's. Is DTC P0944 present in addition to the DTC that you are diagnosing? Yes → Refer to symptom list and perform test for P0944. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	5-SPD AUTO-MATIC 5-45RFE TRANS
3	With the DRBIII®, check for other Transmission DTC's. Are there any Transmission Control Relay related DTC's P0890, P0891, or P0888 present?. Yes → Refer to symptom list and perform test for the related Transmission Control Relay DTC (s). Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	5-SPD AUTO-MATIC 5-45RFE TRANS
4	With the DRBIII®, Check the STARTS SINCE SET counter for P0841. **NOTE: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter 2 or less? Yes → Go To 5 No → Go To 12	5-SPD AUTO-MATIC 5-45RFE TRANS
5	Turn the ignition off to the lock position. Remove the Starter Relay. **NOTE: Failure to remove the Starter Relay can cause a TCM - No Response condition.** Install Transmission simulator (Miller tool #8333) **Note: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. Place pressure switch selector on L/R and observe L/R Pressure Switch state on the DRBIII® screen while pressing the pressure switch test button. Did the pressure switch state change from open to closed when the switch was depressed? Yes → Go To 6 No → Go To 7	5-SPD AUTO-MATIC 5-45RFE TRANS
6	If there are no possible causes remaining, view repair. Repair Replace the Solenoid/TRS Assembly per the Service Information. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS

P0841-LR PRESSURE SWITCH SENSE CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid /TRS Assembly harness connector **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the L/R Pressure Switch Sense circuit from the TCM harness connector to the Solenoid/TRS Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the L/R Pressure Switch Sense circuit for an open. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	5-SPD AUTOMATIC 5-45RFE TRANS
8	Turn the ignition off to the lock position. Disconnect the Transmission Solenoid/TRS Assembly harness connector. Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Transmission Relay Output circuit in the Transmission Solenoid/TRS harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 9 No → Repair the Transmission Control Relay Output circuit for an open. If the fuse is open make sure to check for a short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS
9	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/TRS Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the L/R Pressure Switch Sense circuit. Is the resistance below 5.0 ohms? Yes → Repair the L/R Pressure Switch Sense circuit for a short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 10	5-SPD AUTOMATIC 5-45RFE TRANS

P0841-LR PRESSURE SWITCH SENSE CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
10	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/TRS Assembly harness connector. Remove the Transmission Control Relay. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector. Ignition on, engine not running. Measure the voltage of the L/R Pressure Switch Sense circuit in the TCM harness connector. Is the voltage above 0.5 volt? Yes → Repair the L/R Pressure Switch Sense circuit for a short to voltage. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 11	5-SPD AUTOMATIC 5-45RFE TRANS
11	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS
12	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. Sump filter installed incorrectly Reverse carrier snap ring dislodged (typically sets code on heavy throttle acceleration from a dead stop) Were there any problems found? Yes → Repair as necessary. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	5-SPD AUTOMATIC 5-45RFE TRANS

Symptom:
P0845-2C HYDRAULIC PRESSURE TEST FAILURE

When Monitored and Set Condition:

P0845-2C HYDRAULIC PRESSURE TEST FAILURE

When Monitored: In any forward gear with engine speed above 1000 RPM shortly after a shift and every minute thereafter.

Set Condition: After a shift into a forward gear, with engine speed above 1000 RPM, the TCM momentarily turns on element pressure to the Clutch circuits that don't have pressure to identify the correct Pressure Switch closes. If the Pressure Switch does not close 2 times, the DTC sets.

POSSIBLE CAUSES
RELATED LINE PRESSURE DTC'S PRESENT
RELATED PRESSURE SWITCH AND/OR SPEED RATIO DTC'S PRESENT
TCM AND WIRING - LOW LINE PRESSURE
INTERMITTENT WIRING AND CONNECTORS
2C PRESSURE SWITCH SENSE CIRCUIT OPEN
5-VOLT SUPPLY CIRCUIT OPEN
POOR LINE PRESSURE SENSOR CONNECTION
TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN
2C PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND
5-VOLT SUPPLY CIRCUIT SHORT TO GROUND
2C PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
EXCESSIVE DEBRIS IN OIL PAN
INTERNAL TRANSMISSION PROBLEM - 2C PRESSURE TEST
TCM - 2C PRESSURE SWITCH
TCM - NO 5 VOLT - LOW LINE PRESSURE SENSOR

P0845-2C HYDRAULIC PRESSURE TEST FAILURE — Continued

TEST	ACTION	APPLICABILITY

Continue Go To 2	All
2	With the DRBIII®, check for other transmission DTC's Are there any line pressure related DTC's P0867, P0932, P0868, P0869, or P0944 present? Yes → Refer to Symptom List for the related symptom(s). Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	5-SPD AUTOMATIC 5-45RFE TRANS
3	With the DRBIII®, check for other transmission DTC's Is the DTC P0732 and/or P0846 present also? Yes → Replace the Transmission Solenoid/TRS Assembly per the Service Information. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	5-SPD AUTOMATIC 5-45RFE TRANS
4	With the DRBIII, Check the STARTS SINCE SET counter for P0845. **NOTE: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter 2 or less? Yes → Go To 5 No → Go To 19	5-SPD AUTOMATIC 5-45RFE TRANS

P0845-2C HYDRAULIC PRESSURE TEST FAILURE — Continued

TEST	ACTION	APPLICABILITY
5	Start the engine. Warm the transmission to 82° C or 180° F. Firmly apply the brakes. With the DRBIII®, monitor the Line Pressure during the following step. Move the shift lever to each gear position and record the line pressure reading. Allow the pressure to stabilize for at least 5 seconds in each range. Did the line pressure remain at a steady value between 585 and 655 Kpa or 85 or 95 PSI? Yes → Go To 6 No → Go To 11	5-SPD AUTOMATIC 5-45RFE TRANS
6	Ignition on, engine not running. With the DRBIII®, monitor the Line Pressure during the following step. Firmly push the Transmission Line Pressure Sensor connector towards the Transmission. Did the Line Pressure change to about 207 kPa or 30 PSI when the connector was pushed? Yes → Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 7	5-SPD AUTOMATIC 5-45RFE TRANS
7	Turn the ignition off to the lock position. Remove the Starter Relay. **NOTE: Failure to remove the Starter Relay can cause a TCM - No Response condition.** Install the Transmission Simulator Miller tool# 8333. With the Transmission Simulator select the ″OFF″ position on the ″Input/Output Speed″ switch. **NOTE: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. With the DRBIII®, monitor the Line Pressure during the following step. Using the Transmission Simulator, set the rotary knob to each of the 3 line pressure positions. **NOTE: All three DRBIII® Line Pressure readings should be steady and ± 2.0 PSI of the reading specified on the Transmission Simulator.** Did the Line Pressure remain steady in all three positions? Yes → Replace the Line Pressure Sensor per the Service Information. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	5-SPD AUTOMATIC 5-45RFE TRANS

P0845-2C HYDRAULIC PRESSURE TEST FAILURE — Continued

TEST	ACTION	APPLICABILITY
8	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Line Pressure Sensor harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the 5-volt Supply circuit from the Line Pressure Sensor harness connector to the TCM harness connector. Is the resistance above 5.0 ohms? Yes → Repair the 5-volt Supply circuit for an open. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 9	5-SPD AUTOMATIC 5-45RFE TRANS
9	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Line Pressure Sensor harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the 5-volt Supply circuit. Is the resistance below 5.0 ohms? Yes → Repair the 5-volt Supply circuit for a short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 10	5-SPD AUTOMATIC 5-45RFE TRANS
10	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN AND REPROGRAM PINION FACTOR. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS
11	Turn the ignition off to the lock position. Remove the Starter Relay. **NOTE: Failure to remove the Starter Relay can cause a TCM - No Response condition.** Install the Transmission Simulator Miller tool# 8333. With the Transmission Simulator Miller tool# 8333, turn the Pressure Switch selector to 2C. **Note: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. With the DRBIII®, monitor the 2C Pressure Switch state during the following step. While pressing and holding the Pressure Switch test button, wiggle the wiring harness and connectors pertaining to the 2C Pressure Switch. Did the 2C Pressure Switch state change to closed and remain closed while wiggling the wires? Yes → Go To 12 No → Go To 14	5-SPD AUTOMATIC 5-45RFE TRANS

P0845-2C HYDRAULIC PRESSURE TEST FAILURE — Continued

TEST	ACTION	APPLICABILITY
12	Remove and inspect the Transmission Oil Pan per the Service Information. Does the Transmission Oil Pan contain excessive debris or contamination? Yes → Repair the cause of the excessive debris in the Transmission Oil Pan. Refer to the Service Information for the proper procedures. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 13	5-SPD AUTOMATIC 5-45RFE TRANS
13	If there are no possible causes remaining, view repair. Repair Repair Internal Transmission as necessary. Disassemble and inspect the Valve Body and repair or replace as necessary. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS
14	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid /TRS Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the 2C Pressure Switch Sense circuit from the TCM harness connector to the Transmission Solenoid/TRS Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the 2C Pressure Switch Sense circuit for an open. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 15	5-SPD AUTOMATIC 5-45RFE TRANS
15	Turn the ignition off to the lock position. Disconnect the Transmission Solenoid/TRS Assembly harness connector. Disconnect the TCM harness connector. Connect a jumper wire between the Fused B(+) circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector. Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Transmission Control Relay Output circuit in the Transmission Solenoid/TRS Assembly harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 16 No → Repair the Transmission Control Relay Output circuit for an open. If the fuse is open make sure to check for a short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS

P0845-2C HYDRAULIC PRESSURE TEST FAILURE — Continued

TEST	ACTION	APPLICABILITY
16	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/TRS Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the 2C Pressure Switch Sense circuit. Is the resistance below 5.0 ohms? Yes → Repair the 2C Pressure Switch circuit for a short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 17	5-SPD AUTO-MATIC 5-45RFE TRANS
17	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/TRS Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector. Ignition on, engine not running. Measure the voltage of the 2C Pressure Switch Sense circuit in the TCM harness connector. Is the voltage above 0.5 volt? Yes → Repair the 2C Pressure Switch Sense circuit for a short to voltage. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 18	5-SPD AUTO-MATIC 5-45RFE TRANS
18	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS
19	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	5-SPD AUTO-MATIC 5-45RFE TRANS

Symptom:
P0846-2C PRESSURE SWITCH SENSE CIRCUIT

When Monitored and Set Condition:

P0846-2C PRESSURE SWITCH SENSE CIRCUIT

When Monitored: Whenever the engine is running.

Set Condition: The appropriate code is set if one of the pressure switches are open or closed at the wrong time in a given gear .

POSSIBLE CAUSES
RELATED RELAY DTC'S PRESENT
INTERMITTENT CONDITIONS
2C PRESSURE SWITCH SENSE CIRCUIT OPEN
TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN
2C PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND
2C PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE

P0867-LINE PRESSURE FAULT — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, check for other transmission DTC's. Are there any other line pressure related DTC's P0932, P0868, or P0869 present? Yes → Refer to symptom list and perform test for other line pressure related DTC's. Run test for P0932 first if present. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	5-SPD AUTOMATIC 5-45RFE TRANS
3	**CAUTION: Apply Parking Brake** Start the engine. **CAUTION: Firmly apply the brakes.** With the DRBIII®, monitor the Line Pressure, Desired Line Pressure and the TPS Degrees. While firmly applying the brakes place shifter in the R position. Then slowly press the accelerator pedal to TPS degree of 15. Compare the Line Pressure reading to the Desired Line Pressure reading on the DRBIII®. Does the Line Pressure and Desired Line Pressure stay within ± 34 kPa or 5 PSI? No → Go To 4 Yes → Go To 8	5-SPD AUTOMATIC 5-45RFE TRANS
4	With the DRBIII®, monitor the Line Pressure Sensor voltage while wiggling the wiring harness and connectors pertaining to the Line Pressure Sensor and the Solenoid/TRS assembly. Did the voltage remain steady while wiggling the wiring harness and connectors? Yes → Go To 5 No → Repair as necessary. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS
5	Turn the ignition off to the lock position. Remove the Starter Relay from the PDC. **NOTE: Failure to remove the Starter Relay can cause a TCM - No Response condition.** Install Transmission Simulator Miller tool #8333. With the Transmission Simulator select the ″OFF″ position on the ″Input/Output Speed″ switch. Ignition on, engine not running. With the DRBIII®, monitor the Line Pressure during the following step. Using the Transmission Simulator, turn the selector switch to each of the 3 Line Pressure positions. **NOTE: All three DRBIII® Line Pressure readings should be steady and ± 2.0 PSI of the reading specified on the Transmission Simulator.** Does the Line Pressure fluctuate up and down more than 69 kPa or 10 PSI at any of the positions? Yes → Go To 6 No → Go To 7	5-SPD AUTOMATIC 5-45RFE TRANS

P0867-LINE PRESSURE FAULT — Continued

TEST	ACTION	APPLICABILITY
6	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS
7	If there are no possible causes remaining, view repair. Repair If the transmission is to be repaired, inspect the oil pump per Service Manual information and replace if necessary. If no problem is found, replace the Solenoid/TRS assembly - stuck Pressure Control Solenoid. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS
8	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. Where there any problems found? Yes → Repair as necessary. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	5-SPD AUTO-MATIC 5-45RFE TRANS

Symptom:
P0868-LINE PRESSURE LOW

When Monitored and Set Condition:

P0868-LINE PRESSURE LOW

When Monitored: Continuously while driving in a forward gear.

Set Condition: The TCM continuously monitors Actual Line Pressure and compares it to Desired Line Pressure. If Actual Line Pressure is more than 10 PSI below Desired Line Pressure, this code will be set.

POSSIBLE CAUSES
CHECK FOR RELATED DTC'S
TCM AND WIRING - LOW LINE PRESSURE
INTERMITTENT WIRING AND CONNECTORS
5 VOLT SUPPLY CIRCUIT OPEN
POOR LINE PRESSURE SENSOR CONNECTION
5 VOLT SUPPLY CIRCUIT SHORT TO GROUND
5 VOLT SUPPLY CIRCUIT SHORT TO VOLTAGE
PRESSURE CONTROL SOLENOID CONTROL CIRCUIT SHORT TO VOLTAGE
INTERNAL TRANSMISSION - LINE PRESSURE LOW
LINE PRESSURE SENSOR - CALIBRATION OUT OF LIMITS
PLUGGED FILTER
TCM - LINE PRESSURE LOW

P0868-LINE PRESSURE LOW — Continued

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing transmission symptom diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSB's related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	With the DRBIII®, check for other transmission DTC's Is the DTC P0932 present also? Yes → Refer to symptom list for problems related to P0932. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	5-SPD AUTOMATIC 5-45RFE TRANS
3	With the DRBIII®, check the STARTS SINCE SET counter for P0868. **NOTE: This counter only applies to the last DTC set.** Is the START SINCE SET COUNTER 2 or less? Yes → Go To 4 No → Go To 14	5-SPD AUTOMATIC 5-45RFE TRANS
4	Ignition on, engine not running. With the DRBIII®, monitor the Line Pressure, firmly push the Line Pressure Sensor harness connector towards the Transmission. Did the Line Pressure change to about 207 kPa or 30 PSI when the connector was pushed? Yes → Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	5-SPD AUTOMATIC 5-45RFE TRANS

P0868-LINE PRESSURE LOW — Continued

TEST	ACTION	APPLICABILITY
5	Turn the ignition off to the lock position. Remove the Starter Relay. **NOTE: Failure to remove the Starter Relay can cause a TCM - No Response condition.** Install the Transmission Simulator Miller tool# 8333. With the Transmission Simulator select the ″OFF″ position on the ″Input/Output Speed″ switch. **NOTE: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. With the DRBIII®, monitor the Line Pressure during the following step. Using the Transmission Simulator, set the rotary knob to each of the 3 line pressure positions. **NOTE: All three DRBIII® Line Pressure readings should be steady and ± 2.0 PSI of the reading specified on the Transmission Simulator.** Did the Line Pressure remain steady in all three positions? Yes → Go To 6 No → Go To 9	5-SPD AUTO-MATIC 5-45RFE TRANS
6	Turn the ignition off to the lock position. Install the Line Pressure Adaptor, Miller tool# 8259, and the Pressure Gage, Miller tool# C-3293, 0 to 2000 kPa or 0 to 300 PSI. Start the engine in park. With the DRBIII® monitor the Line Pressure. Monitor the reading on the Pressure Gage Miller tool# C-3293. Compare the Line Pressure readings between the DRBIII® and the Pressure Gage. Is the Line Pressure Gauge reading within 34 kPa or 5 PSI of the DRBIII® reading? Yes → Go To 7 No → Replace the Line Pressure Sensor per the Service Information. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS
7	Remove and inspect the Transmission Oil Pan for excessive debris per the Service Information. Remove and inspect the Primary Oil Filter per the Service Information. **NOTE: Make sure the Primary Transmission Oil Filter and/or O-ring is not cracked or split.** Does the Oil Pan contain excessive debris and/or is the Primary Oil Filter cracked or plugged? Yes → Repair the plugged, cracked, or split Primary Transmission Oil Filter and/or O-ring. If the Primary Transmission Oil Filter is plugged refer to the Service Information for the proper Hydraulic repair procedure. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	5-SPD AUTO-MATIC 5-45RFE TRANS

P0868-LINE PRESSURE LOW — Continued

TEST	ACTION	APPLICABILITY
8	If there are no possible causes remaining, view repair. Repair Repair internal transmission problem. If the transmission is to be repaired, inspect the oil pump per the Service Information and replace if necessary. If no problem is found, replace the Solenoid/TRS assembly. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS
9	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Line Pressure Sensor harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the 5-volt Supply circuit from the Line Pressure Sensor harness connector to the TCM harness connector. Is the resistance above 5.0 ohms? Yes → Repair the 5-volt Supply circuit for an open. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 10	5-SPD AUTOMATIC 5-45RFE TRANS
10	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Line Pressure Sensor harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the 5-volt Supply circuit. Is the resistance Below 5.0 ohms? Yes → Repair the 5-volt Supply circuit for a short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 11	5-SPD AUTOMATIC 5-45RFE TRANS
11	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Remove the Transmission Control Relay from the PDC. Place a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector. Ignition on, engine not running. **Note: Check connectors - Clean/repair as necessary.** Measure the voltage of the 5-volt Supply circuit in the TCM harness connector. Is the voltage above 5.5 volts? Yes → Repair the 5-volt Supply circuit for a short to voltage. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 12	5-SPD AUTOMATIC 5-45RFE TRANS

P0868-LINE PRESSURE LOW — Continued

TEST	ACTION	APPLICABILITY
12	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/TRS harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B(+) circuit and the Trans Relay Output circuit in the relay connector. Ignition on, engine not running. Measure the voltage of the Pressure Control Solenoid control circuit in the TCM harness connector. Is the voltage above 0.5 volts? Yes → Repair the Pressure Control Solenoid Control circuit for a short to voltage. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 13	5-SPD AUTOMATIC 5-45RFE TRANS
13	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS
14	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	5-SPD AUTOMATIC 5-45RFE TRANS

Symptom:
P0869-LINE PRESSURE HIGH

When Monitored and Set Condition:

P0869-LINE PRESSURE HIGH

When Monitored: Continuously while driving in a forward gear.

Set Condition: The TCM continuously monitors Actual Line Pressure and compares it to Desired Line Pressure. If Actual Line Pressure is more than 10 PSI above Desired Line Pressure, this code will be set.

POSSIBLE CAUSES
CHECK FOR RELATED DTC'S
TCM AND WIRING - LINE PRESSURE HIGH
INTERMITTENT WIRING AND CONNECTORS
5-VOLT SUPPLY CIRCUIT OPEN
POOR LINE PRESSURE SENSOR CONNECTION
PRESSURE CONTROL SOLENOID CONTROL CIRCUIT OPEN
5-VOLT SUPPLY CIRCUIT SHORT TO GROUND
PRESSURE CONTROL SOLENOID CONTROL CIRCUIT SHORT TO GROUND
INTERNAL TRANSMISSION - LINE PRESSURE HIGH
LINE PRESSURE SENSOR - CALIBRATION OUT OF LIMITS
TCM - LINE PRESSURE HIGH

P0869-LINE PRESSURE HIGH — Continued

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing transmission symptom diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSB's related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	With the DRBIII®, check for other Transmission DTC's Is the DTC P0932 present also? Yes → Refer to symptom list for problems related to P0932. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	5-SPD AUTOMATIC 5-45RFE TRANS
3	The transmission temperature must be at least 180 degrees for the results of this test to be valid. With the DRBIII®, check the STARTS SINCE SET counter for P0869. Is the STARTS SINCE SET COUNTER 2 or less? Yes → Go To 4 No → Go To 13	5-SPD AUTOMATIC 5-45RFE TRANS
4	Ignition on, engine not running. With the DRBIII®, monitor the Transmission Line Pressure. Firmly push the Line Pressure Sensor harness connector inward towards the Transmission. Did the Line Pressure change to about 207 kPa or 30 PSI when the sensor connector was pushed? Yes → Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	5-SPD AUTOMATIC 5-45RFE TRANS

P0869-LINE PRESSURE HIGH — Continued

TEST	ACTION	APPLICABILITY
5	Turn the ignition off to the lock position. Remove the Starter Relay. **NOTE: Failure to remove the Starter Relay can cause a TCM - No Response condition.** Install the Transmission Simulator Miller tool# 8333. With the Transmission Simulator select the ″OFF″ position on the ″Input/Output Speed″ switch. **NOTE: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. With the DRBIII®, monitor the Line Pressure during the following step. Using the Transmission Simulator, set the rotary knob to each of the 3 line pressure positions. **NOTE: All three DRBIII® Line Pressure readings should be steady and ± 2.0 PSI of the reading specified on the Transmission Simulator.** Did the Line Pressure remain steady in all three positions? Yes → Go To 6 No → Go To 8	5-SPD AUTO-MATIC 5-45RFE TRANS
6	Turn the ignition off to the lock position. Install the Line Pressure Adaptor, Miller tool# 8259, and the Pressure Gage, Miller tool# C-3293, 0 to 2000 kPa or 0 to 300 PSI. Start the engine in park. With the DRBIII®, monitor the Line Pressure. Monitor the reading on the Pressure Gage, Miller tool# C-3293. Compare the Line Pressure reading between the DRBIII® and the Pressure Gage. Is the Pressure Gauge reading within 34 kPa or 5 PSI of the DRBIII® reading? Yes → Go To 7 No → Replace the Line Pressure Sensor. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS
7	If there are no possible causes remaining, view repair. Repair If the transmission is to be repaired, inspect the oil pump per the Service Information and replace if necessary. If no problem is found, replace the Solenoid/TRS assembly - stuck Pressure Control Solenoid. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS
8	Turn the ignition off to the lock position. Disconnect the Transmission Control Module harness connector. Disconnect the Line Pressure Sensor harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the 5-volt Supply circuit from the Line Pressure Sensor harness connector to the Transmission Control Module harness connector. Is the resistance above 5.0 ohms? Yes → Repair the 5-volt Supply circuit for an open. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 9	5-SPD AUTO-MATIC 5-45RFE TRANS

P0869-LINE PRESSURE HIGH — Continued

TEST	ACTION	APPLICABILITY
9	Turn the ignition off to the lock position. Disconnect the Transmission Control Module harness connector. Disconnect the Transmission Solenoid /TRS harness connector **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the Pressure Control Solenoid Control circuit from the Transmission Control Module harness connector to the Solenoid/TRS harness connector. Is the resistance above 5.0 ohms? Yes → Repair the Pressure Control Solenoid Control circuit for an open. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 10	5-SPD AUTOMATIC 5-45RFE TRANS
10	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Line Pressure Sensor harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the 5-volt Supply circuit. Is the resistance below 5.0 ohms? Yes → Repair the 5-volt Supply circuit for a short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 11	5-SPD AUTOMATIC 5-45RFE TRANS
11	Turn the ignition off to the lock position. Disconnect the Transmission Control Module harness connector. Disconnect the Transmission Solenoid/TRS harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the Pressure Control Solenoid Control circuit. Is the resistance below 5.0 ohms? Yes → Repair the Pressure Control Solenoid Control circuit for a short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 12	5-SPD AUTOMATIC 5-45RFE TRANS
12	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS

Symptom:
P0870-OD HYDRAULIC PRESSURE TEST FAILURE

When Monitored and Set Condition:

P0870-OD HYDRAULIC PRESSURE TEST FAILURE

When Monitored: In any forward gear with engine speed above 1000 RPM shortly after a shift and every minute thereafter.

Set Condition: After a shift into a forward gear, with engine speed above 1000 RPM, the TCM momentarily turns on element pressure to the clutch circuits that don't have pressure to identify the correct pressure switch closes. If the pressure switch does not close 2 times the DTC sets.

POSSIBLE CAUSES
RELATED LINE PRESSURE DTC'S PRESENT
RELATED SPEED RATIO AND/OR PRESSURE SWITCH DTC'S PRESENT
TCM AND WIRING - LOW LINE PRESSURE
INTERMITTENT WIRING & CONNECTORS
5-VOLT SUPPLY CIRCUIT OPEN
OD PRESSURE SWITCH SENSE CIRCUIT OPEN
POOR LINE PRESSURE SENSOR CONNECTION
TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN
5-VOLT SUPPLY CIRCUIT SHORT TO GROUND
OD PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND
OD PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
EXCESSIVE DEBRIS IN OIL PAN
INTERNAL TRANSMISSION PROBLEM - OD PRESSURE TEST
TCM - NO 5 VOLTS - LOW LINE PRESSURE SENSOR
TCM - OD PRESSURE SWITCH

2	With the DRBIII®, check for other Transmission DTC's Are there any Line Pressure related DTC's P0867, P0932, P0868, P0869, or P0944 present? Yes → Refer to symptom list and perform appropriate test. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	5-SPD AUTOMATIC 5-45RFE TRANS
3	With the DRBIII®, check for other Transmission DTC's Is the DTC P0733 and/or P0871 present also? Yes → Replace the Transmission Solenoid/TRS Assembly per the Service Information. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	5-SPD AUTOMATIC 5-45RFE TRANS
4	With the DRBIII®, Check the STARTS SINCE SET counter for P0870. **NOTE: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter 2 or less? Yes → Go To 5 No → Go To 19	5-SPD AUTOMATIC 5-45RFE TRANS

P0870-OD HYDRAULIC PRESSURE TEST FAILURE — Continued

TEST	ACTION	APPLICABILITY
5	Start engine. Warm transmission to 82° C or 180 ° F. Firmly apply brakes. With the DRBIII®, monitor the Transmission Line Pressure. Move the shift lever to each gear position and record the Line Pressure reading. Allow the pressure to stabilize for at least 5 seconds in each range. Did the Line Pressure remain at a steady value between 585 and 655 kPa or 85 and 95 PSI? Yes → Go To 6 No → Go To 11	5-SPD AUTOMATIC 5-45RFE TRANS
6	Turn the ignition off to the lock position. Remove the Starter Relay. **NOTE: Failure to remove Starter Relay can cause a TCM - No Response condition.** Install the Transmission Simulator, Miller tool #8333. With the Transmission Simulator select the ″OFF″ position on the ″Input/Output Speed″ switch. Ignition on, engine not running. With the DRBIII®, monitor the Line Pressure during the following step. Using the Transmission Simulator, turn the selector switch to each of the 3 Line Pressure positions. **NOTE: All three DRBIII® Line Pressure readings should be steady and ± 2.0 PSI of the reading specified on the Transmission Simulator.** Did the Line Pressure remain steady in all 3 positions? Yes → Replace the Line Pressure Sensor per the Service Information. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 7	5-SPD AUTOMATIC 5-45RFE TRANS
7	Ignition on, engine not running. With the DRBIII®, monitor the Line Pressure while firmly pushing the Line Pressure Sensor connector towards the Transmission. Did the Line Pressure change to about 207 kPa or 30 PSI when the connector was pushed? Yes → Disconnect and properly reconnect the Line Pressure Sensor harness connector. Inspect terminals and repair as necessary. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	5-SPD AUTOMATIC 5-45RFE TRANS
8	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Line Pressure Sensor harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the 5-volt Supply circuit from the Line Pressure Sensor harness connector to the TCM harness connector. Is the resistance above 5.0 ohms? Yes → Repair the 5-volt supply circuit for an open. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 9	5-SPD AUTOMATIC 5-45RFE TRANS

P0870-OD HYDRAULIC PRESSURE TEST FAILURE — Continued

TEST	ACTION	APPLICABILITY
9	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Line Pressure Sensor harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the 5-volt Supply circuit. Is the resistance below 5.0 ohms? Yes → Repair the 5-volt Supply circuit for a short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 10	5-SPD AUTO-MATIC 5-45RFE TRANS
10	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS
11	Turn the ignition off to the lock position. Remove the Starter Relay. **NOTE: Failure to remove the Starter Relay can cause a TCM - No Response condition.** Install Transmission Simulator Miller tool #8333. **Note: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. With the DRBIII®, monitor the OD Pressure Switch state during the following steps. With the Transmission Simulator Miller tool# 8333, place the selector switch on OD. While pressing the Pressure Switch test button, wiggle the wiring harness and connectors pertaining to the OD Pressure Switch. Did the OD pressure switch state change to closed and remain closed while wiggling the wires? Yes → Go To 12 No → Go To 14	5-SPD AUTO-MATIC 5-45RFE TRANS
12	Remove and inspect the Transmission Oil Pan per the Service Information. Does the Transmission Oil Pan contain excessive debris or contamination? Yes → Repair the cause of the excessive debris in the Transmission Oil Pan. Refer to the Service Information for the proper procedures. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 13	5-SPD AUTO-MATIC 5-45RFE TRANS

P0870-OD HYDRAULIC PRESSURE TEST FAILURE — Continued

TEST	ACTION	APPLICABILITY
13	If there are no possible causes remaining, view repair. Repair Repair Internal Transmission as necessary. Disassemble and inspect the Valve Body and repair or replace as necessary. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS
14	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid /TRS Assembly harness connector **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the OD Pressure Switch Sense circuit from the TCM harness connector to the Solenoid/TRS Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the OD Pressure Switch Sense circuit for an open. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 15	5-SPD AUTO-MATIC 5-45RFE TRANS
15	Turn the ignition off to the lock position. Disconnect the Transmission Solenoid/TRS Assembly harness connector. Disconnect the Transmission Control Relay from the PDC. Connect a jumper wire between the Fused B(+) circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector. Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Transmission Control Relay Output circuit at the Solenoid/TRS Assembly harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 16 No → Repair the Transmission Control Relay Output circuit for an open. If the fuse is open make sure to check for a short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS
16	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/TRS Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the OD Pressure Switch Sense circuit. Is the resistance below 5.0 ohms? Yes → Repair the OD Pressure Switch circuit for a short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. 2	With the DRBIII®, check for other transmission DTC's. Are there any Transmission Control Relay related DTC's, P0890, P0891, or P0888 present? Yes → Refer to symptom list and perform test for Transmission Control Relay related DTCs. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	5-SPD AUTO-MATIC 5-45RFE TRANS
3	Ignition on, engine not running. With the DRBIII®, Check the STARTS SINCE SET counter for P0871. **NOTE: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter 2 or less? Yes → Go To 4 No → Go To 11	5-SPD AUTO-MATIC 5-45RFE TRANS
4	Turn the ignition off to the lock position. Remove the Starter Relay from the PDC. **NOTE: Failure to remove the Starter Relay can cause a TCM - No Response condition.** Install Transmission Simulator, Miller tool #8333. **Note: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. With the Transmission Simulator, turn the Pressure Switch selector switch to OD. With the DRBIII®, monitor the OD Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator. Did the state of the OD Pressure Switch change while pressing the Pressure Switch Test button? Yes → Go To 5 No → Go To 6	5-SPD AUTO-MATIC 5-45RFE TRANS
5	If there are no possible causes remaining, view repair. Repair Replace the Transmission Solenoid/TRS Assembly per the Service Information. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS
6	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid /TRS Assembly harness connector **NOTE: Check connectors - Clean/repair as necessary.** Measure the resistance of the OD Pressure Switch Sense circuit from the TCM harness connector to the Solenoid/TRS Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the OD Pressure Switch Sense circuit for an open. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 7	5-SPD AUTO-MATIC 5-45RFE TRANS

P0871-OD PRESSURE SWITCH SENSE CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off to the lock position. Disconnect the Transmission Solenoid/TRS Assembly harness connector. Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Transmission Relay output circuit in the Transmission Solenoid/TRS harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 8 No → Repair cause of unlit or dim test light. Open circuit or high resistance in Transmission Relay output circuit. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS
8	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/TRS Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the OD Pressure Switch Sense circuit. Is the resistance below 5.0 ohms? Yes → Repair the OD Pressure Switch Sense circuit for a short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 9	5-SPD AUTO-MATIC 5-45RFE TRANS
9	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/TRS Assembly harness connector. Remove the Transmission Control Relay the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and Transmission Control Relay Output circuit in the Transmission Control Relay connector. Ignition on, engine not running. Measure the voltage of the OD Pressure Switch Sense circuit at the TCM harness connector. Is the voltage above 0.5 volts? Yes → Repair the OD Pressure Switch Sense circuit for a short to voltage. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 10	5-SPD AUTO-MATIC 5-45RFE TRANS
10	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS

TEST	ACTION	APPLICABILITY
11	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. Check for a Sump filter not installed correctly Reverse carrier snap ring dislodged (typically sets on heavy throttle acceleration from a dead stop) Were there any problems found? Yes → Repair as necessary. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	5-SPD AUTOMATIC 5-45RFE TRANS

Symptom:
P0875-UD HYDRAULIC PRESSURE TEST FAILURE

When Monitored and Set Condition:

P0875-UD HYDRAULIC PRESSURE TEST FAILURE

When Monitored: In any forward gear with engine speed above 1000 RPM shortly after a shift and every minute thereafter.

Set Condition: After a shift into a forward gear, with engine speed above 1000 RPM, the TCM momentarily turns on element pressure to the clutch circuits don't have pressure to identify the correct pressure switch closes. If the pressure switch does not close 2 times the DTC sets.

POSSIBLE CAUSES
RELATED LINE PRESSURE DTC'S PRESENT
RELATED SPEED RATIO AND/OR PRESSURE SWITCH DTC'S PRESENT
TCM AND WIRING - LOW LINE PRESSURE
INTERMITTENT WIRING AND CONNECTORS
5-VOLT SUPPLY CIRCUIT OPEN
POOR LINE PRESSURE SENSOR CONNECTION
TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN
UD PRESSURE SWITCH SENSE CIRCUIT OPEN
5-VOLT SUPPLY CIRCUIT SHORT TO GROUND
UD PRESSURE SWITCH CIRCUIT SHORT TO GROUND
UD PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
EXCESSIVE DEBRIS IN OIL PAN
INTERNAL TRANSMISSION - UD PRESSURE TEST
TCM - NO 5 VOLTS - LOW LINE PRESSURE SENSOR
TCM - UD PRESSURE SWITCH

P0875-UD HYDRAULIC PRESSURE TEST FAILURE — Continued

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing transmission symptom diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSB's related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	With the DRBIII®, check for other Transmission DTC's Are there any line pressure related DTC's, P0867, P0932, P0868, P0869, or P0944 present? Yes → Refer to Symptom List for the related symptom(s). Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	5-SPD AUTOMATIC 5-45RFE TRANS
3	With the DRBIII®, check for other transmission DTC's Are the DTC's P0731, P0732, P0733 and/or P0876 present? Yes → Replace the Transmission Solenoid/TRS Assembly per the Service Information. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	5-SPD AUTOMATIC 5-45RFE TRANS
4	With the DRBIII®, Check the STARTS SINCE SET counter for P0875. **NOTE: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter 2 or less? Yes → Go To 5 No → Go To 19	5-SPD AUTOMATIC 5-45RFE TRANS

P0875-UD HYDRAULIC PRESSURE TEST FAILURE — Continued

TEST	ACTION	APPLICABILITY
5	Start engine. Warm the transmission to 82° C or 180° F. Firmly apply brakes. With the DRBIII®, monitor the Line Pressure in the following step. Move the shift lever to each gear position and record the Line Pressure reading. Allow the pressure to stabilize for at least 5 seconds in each range. Did the Line Pressure remain at a steady value between 585 and 655 kPa or 85 and 95 PSI? Yes → Go To 6 No → Go To 11	5-SPD AUTOMATIC 5-45RFE TRANS
6	Ignition on, engine not running. With the DRBIII®, monitor the Line Pressure for the following step. Firmly push the Line Pressure Sensor connector inward towards the Transmission. Did the Line Pressure change to about 207 kPa or 30 PSI when the connector was pushed? Yes → Disconnect and properly reconnect the Line Pressure Sensor harness connector. Inspect terminals and repair as necessary. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 7	5-SPD AUTOMATIC 5-45RFE TRANS
7	Turn the ignition off to the lock position. Remove the Starter Relay from the PDC. **NOTE: Failure to remove the Starter Relay can cause a TCM - No Response condition.** Install the Transmission Simulator Miller tool #8333. With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch. **NOTE: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. With the DRBIII®, monitor the Line Pressure in the following step. With the Transmission Simulator, set the rotary knob to each of the 3 line pressure positions. **NOTE: All three DRBIII® Line Pressure readings should be steady and ± 2.0 PSI of the reading specified on the Transmission Simulator.** Did the Line Pressure remain steady in all three positions? Yes → Replace the Line Pressure Sensor per the Service Information. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	5-SPD AUTOMATIC 5-45RFE TRANS
8	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Line Pressure Sensor harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the 5-volt Supply circuit from the Line Pressure Sensor harness connector to the TCM harness connector. Is the resistance above 5.0 ohms? Yes → Repair the 5-volt Supply circuit for an open. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 9	5-SPD AUTOMATIC 5-45RFE TRANS

P0875-UD HYDRAULIC PRESSURE TEST FAILURE — Continued

TEST	ACTION	APPLICABILITY
9	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Line Pressure Sensor harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the 5-volt Supply circuit. Is the resistance Below 5.0 ohms? Yes → Repair the 5-volt Supply circuit for a short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 10	5-SPD AUTOMATIC 5-45RFE TRANS
10	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS
11	Turn the ignition off to the lock position. Remove the Starter Relay from the PDC. **NOTE: Failure to remove the Starter Relay can cause a TCM - No Response condition.** Install Transmission Simulator Miller tool #8333. **Note: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. With the DRBIII®, monitor the UD Pressure Switch state. With the Transmission Simulator Miller tool# 8333, place the selector switch on UD. While pressing and holding the Pressure Switch test button, wiggle the wiring harness and connectors pertaining to the UD Pressure Switch. Did the UD Pressure Switch state change to closed and remain closed while wiggling the wires? Yes → Go To 12 No → Go To 14	5-SPD AUTOMATIC 5-45RFE TRANS
12	Remove and inspect Transmission Oil Pan per the Service Information. Does it contain excessive debris or contamination? Yes → Repair the cause of the excessive debris in the Transmission Oil Pan. Refer to the Service Information for the proper procedures. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 13	5-SPD AUTOMATIC 5-45RFE TRANS

P0875-UD HYDRAULIC PRESSURE TEST FAILURE — Continued

TEST	ACTION	APPLICABILITY
13	If there are no possible causes remaining, view repair. Repair Repair Internal Transmission as necessary. Disassemble and inspect the Valve Body and repair or replace as necessary. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS
14	Turn the ignition off to the lock position. Disconnect the Transmission Solenoid/TRS Assembly harness connector. Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Transmission Control Relay Output circuit in the Solenoid/TRS Assembly harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 15 No → Repair the Transmission Control Relay Output circuit for an open. If the fuse is open make sure to check for a short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS
15	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid /TRS Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the UD Pressure Switch Sense circuit from the TCM harness connector to the Solenoid/TRS Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the UD Pressure Switch Sense circuit for an open.. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 16	5-SPD AUTO-MATIC 5-45RFE TRANS
16	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/TRS Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the UD Pressure Switch Sense circuit. Is the resistance below 5.0 ohms? Yes → Repair the UD Pressure Switch circuit for a short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 17	5-SPD AUTO-MATIC 5-45RFE TRANS

P0875-UD HYDRAULIC PRESSURE TEST FAILURE — Continued

TEST	ACTION	APPLICABILITY
17	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/TRS Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B(+) circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector. Ignition on, engine not running. Measure the voltage of the UD Pressure Switch Sense circuit in the TCM harness connector. Is the voltage above 0.5 volt? Yes → Repair the UD Pressure Switch Sense circuit for a short to voltage. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 18	5-SPD AUTO-MATIC 5-45RFE TRANS
18	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS
19	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	5-SPD AUTO-MATIC 5-45RFE TRANS

Symptom:
P0876-UD PRESSURE SWITCH SENSE CIRCUIT

When Monitored and Set Condition:

P0876-UD PRESSURE SWITCH SENSE CIRCUIT

When Monitored: Whenever the engine is running.

Set Condition: This DTC is set if the UD pressure switch is in the wrong state for the current gear. For example, this code would be set if the UD pressure switch remained off while the transmission was in second gear.

POSSIBLE CAUSES
RELATED RELAY DTC'S PRESENT
INTERMITTENT CONDITIONS
TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN
UD PRESSURE SWITCH SENSE CIRCUIT OPEN
UD PRESSURE SWITCH CIRCUIT SHORT TO GROUND
UD PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
UD PRESSURE SWITCH
TCM - UD PRESSURE SWITCH

TEST	ACTION	APPLICABILITY
16	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/TRS harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the 4C Pressure Switch Sense circuit. Is the resistance below 5.0 ohms? Yes → Repair the 4C Pressure Switch Sense circuit for a short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 17	5-SPD AUTO-MATIC 5-45RFE TRANS
17	Turn the ignition off to the lock position. Disconnect the Transmission Control Module harness connector. Disconnect the Transmission Solenoid/TRS harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B(+) circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector. Ignition on, engine not running. Measure the voltage of the 4C Pressure Switch Sense circuit in the TCM harness connector. Is the voltage above 0.5 volt? Yes → Repair the 4C Pressure Switch Sense circuit for a short to voltage. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 18	5-SPD AUTO-MATIC 5-45RFE TRANS
18	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS
19	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	5-SPD AUTO-MATIC 5-45RFE TRANS

Symptom:
P0988-4C PRESSURE SWITCH SENSE CIRCUIT

When Monitored and Set Condition:

P0988-4C PRESSURE SWITCH SENSE CIRCUIT

When Monitored: Whenever the engine is running.

Set Condition: This DTC is set if the 4C pressure switch is in the wrong state for the current gear. For example, this code would be set if the 4C pressure switch came on while the transmission was in second gear.

POSSIBLE CAUSES
RELATED RELAY DTC'S PRESENT
INTERMITTENT CONDITIONS
4C PRESSURE SWITCH SENSE CIRCUIT OPEN
TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN
4C PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND
4C PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
4C PRESSURE SWITCH
TCM - 4C PRESSURE SWITCH

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing transmission symptom diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSB's related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

P0988-4C PRESSURE SWITCH SENSE CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, check for other transmission DTC's. Are there any Transmission Control Relay related DTC's P0890, P0891, or P0888 present? Yes → Refer to symptom list and perform test for Transmission Control Relay related DTCs. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	5-SPD AUTO-MATIC 5-45RFE TRANS
3	Ignition on, engine not running. With the DRBIII®, Check the STARTS SINCE SET counter. **NOTE: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter for P0988, 2 or less? Yes → Go To 4 No → Go To 11	5-SPD AUTO-MATIC 5-45RFE TRANS
4	Turn the ignition off to the lock position. Remove the Starter Relay from the PDC. **NOTE: Failure to remove the Starter Relay can cause a TCM - No Response condition.** Install the Transmission Simulator, Miller tool #8333. **Note: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. With the Transmission Simulator turn the Pressure Switch selector switch to 4C. With the DRBIII®, monitor the 4C Pressure Switch state while pressing the Pressure Switch Test button. Did the state of the 4C Pressure Switch change while pressing the Pressure Switch Test button? Yes → Go To 5 No → Go To 6	5-SPD AUTO-MATIC 5-45RFE TRANS
5	If there are no possible causes remaining, view repair. Repair Replace the Transmission Solenoid/TRS Assembly per the Service Information. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS
6	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid /TRS Assembly harness connector **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the 4C Pressure Switch Sense circuit from the TCM harness connector to the Transmission Solenoid/TRS Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the 4C Pressure Switch Sense circuit for an open. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 7	5-SPD AUTO-MATIC 5-45RFE TRANS

P0988-4C PRESSURE SWITCH SENSE CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off to the lock position. Disconnect the Transmission Solenoid/TRS Assembly harness connector. Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Transmission Control Relay Output circuit in the Transmission Solenoid/TRS Assembly harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 8 No → Repair the Transmission Control Relay Output circuit for an open. If the fuse is open make sure to check for a short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS
8	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/TRS Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the 4C Pressure Switch Sense circuit. Is the resistance below 5.0 ohms? Yes → Repair the 4C Pressure Switch Sense circuit for a short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 9	5-SPD AUTOMATIC 5-45RFE TRANS
9	Turn the ignition off to the lock position. Disconnect the Transmission Control Module harness connector. Disconnect the Transmission Solenoid/TRS Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector. Ignition on, engine not running. Measure the voltage of the 4C Pressure Switch Sense circuit in the TCM harness connector. Is the voltage above 0.5 volt? Yes → Repair the 4C Pressure Switch Sense circuit for a short to voltage. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 10	5-SPD AUTOMATIC 5-45RFE TRANS
10	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS

P0988-4C PRESSURE SWITCH SENSE CIRCUIT — Continued

Continue Go To 2	All
2	This DTC is an informational DTC only. This DTC is set due to a momentary loss of the Fused B(+) feed to the TCM. Continue to view the possible causes for this DTC. Continue Go To 3	5-SPD AUTOMATIC 5-45RFE TRANS

P1684-BATTERY WAS DISCONNECTED — Continued

TEST	ACTION	APPLICABILITY
3	Has the battery been disconnected, lost it's charge, or been replaced recently? Yes → This is the cause of the DTC. Erase the DTC and return vehicle to customer. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	5-SPD AUTO-MATIC 5-45RFE TRANS
4	Has a DRBIII® Battery Disconnect procedure been performed? Yes → This is the cause of the DTC. Erase the DTC and return the vehicle to customer. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	5-SPD AUTO-MATIC 5-45RFE TRANS
5	Has a "QUICK LEARN" been performed with the DRBIII®? Yes → This is the cause of the DTC. Erase the DTC and return the vehicle to customer. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 6	5-SPD AUTO-MATIC 5-45RFE TRANS
6	Has the TCM been replaced or disconnected? Yes → Replacing or disconnecting the TCM will set this DTC. Erase the DTC and return the vehicle to the customer. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 7	5-SPD AUTO-MATIC 5-45RFE TRANS
7	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. **NOTE: Check all power and ground circuits to the TCM for intermittent or high resistance circuits.** Wiggle the wires while checking for shorts and open circuits. Check for any TSB's or controller flash updates that may apply. Were there any problems found? Yes → Repair as necessary. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	5-SPD AUTO-MATIC 5-45RFE TRANS

Symptom:
P1694-BUS COMMUNICATION WITH ENGINE MODULE

When Monitored and Set Condition:

P1694-BUS COMMUNICATION WITH ENGINE MODULE

When Monitored: Continuously with ignition key on.

Set Condition: If no bus messages are received from the Powertrain Control Module (PCM) for 10 seconds. Note: Some after market equipment will also set this DTC. example: remote starters and communication equipment.

POSSIBLE CAUSES
OTHER BUS PROBLEMS PRESENT
INTERMITTENT WIRING AND CONNECTORS
PCI BUS CIRCUIT OPEN
TCM - BUS PROBLEM

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing transmission symptom diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSB's related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	With the DRBIII®, Check the STARTS SINCE SET counter. **NOTE: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter equal to zero? Yes → Go To 3 No → Go To 6	5-SPD AUTO-MATIC 5-45RFE TRANS

P1694-BUS COMMUNICATION WITH ENGINE MODULE — Continued

TEST	ACTION	APPLICABILITY
3	With the DRBIII®, attempt to communicate with other modules on the vehicle, check for evidence of a vehicle bus problem. Bus related DTC's in other modules point to an overall vehicle bus problem. Other symptoms such as a customer complaint of intermittent operation of bus controlled features also indicate a bus problem. Does the PRNDL display indicate ″No Bus″ or is there any evidence of an overall vehicle bus problem? Yes → Refer to the Communication Category and perform the appropriate symptom. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	5-SPD AUTOMATIC 5-45RFE TRANS
4	Turn the ignition off to the lock position. Disconnect the PCM harness connectors. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the PCI Bus circuit from the PCM harness connector to the Data Link Connector. **NOTE: CAREFULLY PROBE THE DLC. DAMAGE TO THE DLC TERMINALS WILL RESULT IN POOR TERMINAL TO PIN CONNECTION.** Is the resistance above 5.0 ohms? Yes → Repair the open PCI Bus circuit between the PCM and the Data Link Connector. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	5-SPD AUTOMATIC 5-45RFE TRANS
5	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS
6	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Note: Some after market equipment will set this DTC. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	5-SPD AUTOMATIC 5-45RFE TRANS

Symptom:
P1715-RESTRICTED PORT IN T3 RANGE

When Monitored and Set Condition:

P1715-RESTRICTED PORT IN T3 RANGE

When Monitored: Whenever the PRNDL code indicates Temp3.

Set Condition: This code sets whenever the conditions for a code P1776 (47) are satisfied with the shifter in the temp3 zone. This causes a restricted port.

POSSIBLE CAUSES
RELATED TRANSMISSION DTC'S PRESENT
CUSTOMER DRIVING HABITS
MISADJUSTED SHIFTER

TEST	ACTION	APPLICABILITY
1	With the DRBIII®, check for other transmission DTC's Are any of the following DTC's P0731, P0732, P0733, P0734, P1736 or P0715 present? Yes → Refer to the Transmission category and perform the appropriate symptom. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 2	5-SPD AUTO-MATIC 5-45RFE TRANS
2	Check Shifter adjustment per the Service Information. Adjust if necessary. Did the shifter need to be adjusted?. Yes → Adjust the shift linkage per the Service Information. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	5-SPD AUTO-MATIC 5-45RFE TRANS
3	This DTC can be set if the customer rests his or her hand on the shift lever while they are driving. The transmission can be put in the T3 position if just enough forward pressure is exerted on the shift lever. When this occurs, the feed port to the clutch is restricted, the transmission will declare neutral, and this DTC will be set. The customer should be informed not to rest his or her hand on the shifter while driving. This DTC can also be set by simply bumping the shift lever toward neutral while accelerating. If there are no possible causes remaining, view repair. Repair This DTC can be set by putting too much forward pressure on the shift lever while it is in the OD position. Make sure the customer is informed. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS

Symptom:
P1736-GEAR RATIO ERROR IN 2ND PRIME

When Monitored and Set Condition:

P1736-GEAR RATIO ERROR IN 2ND PRIME

When Monitored: The transmission gear ratio is monitored continuously while the transmission is in gear.

Set Condition: If the ratio of the Input RPM to the Output RPM does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES
RELATED DTC'S PRESENT
INTERMITTENT GEAR RATIO ERRORS
TRANSMISSION INTERNAL - GEAR RATIO ERROR 2ND PRIME

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing transmission symptom diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSB's related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

P1736-GEAR RATIO ERROR IN 2ND PRIME — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, check for other transmission DTC's Are any of the DTC's P0944, P0715, P0720, P1794, P0867, P0932, P0868, or P0869 also present? Yes → If any of these DTCs are present, they will cause a speed ratio error. Refer to appropriate symptom in the Transmission category. Perform the test for P0944 first if it is present. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	5-SPD AUTOMATIC 5-45RFE TRANS
3	With the DRBIII®, perform the 2nd prime Gear Clutch Test. Follow the instructions on the DRBIII®. Increase the throttle angle, TPS Degree, to 30° for no more than a few seconds. **CAUTION: Do not overheat the transmission.** Did the clutch test pass, Input Speed remain at zero? Yes → Go To 4 No → Go To 5	5-SPD AUTOMATIC 5-45RFE TRANS
4	The conditions to set this DTC are not currently present. Check the gearshift linkage adjustment. Intermittent gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit. Check the Speed Sensor wiring and connectors for good connection, then perform a wiggle test using the Transmission Simulator, Miller tool # 8333. Gear ratio DTC's can also be set under extreme temperature conditions, this is usually caused by an internal problem. Verify if the problem is only experienced under extreme hot or cold conditions. If there are no possible causes remaining, view repair. Repair Repair as necessary. If a internal problem is present, refer to the Service information for the proper internal repair procedure. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS
5	If there are no possible causes remaining, view repair. Repair Repair or replace transmission as necessary. If the transmission is to be repaired, and there were any line pressure DTC's present along with this DTC, make sure to inspect the pump and Pressure Control Solenoid per the Service Information. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS

Symptom:
P1775-SOLENOID SWITCH VALVE LATCHED IN TCC POSITION

When Monitored and Set Condition:

P1775-SOLENOID SWITCH VALVE LATCHED IN TCC POSITION

When Monitored: During an attempted shift into 1st gear.

Set Condition: This code is set if three unsuccessful attempts are made to get into 1st gear in one given key start. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES
RELATED DTC P0841 PRESENT
INTERMITTENT WIRING AND CONNECTORS
LR PRESSURE SWITCH SENSE CIRCUIT OPEN
TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN
LR PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND
LR PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
INTERNAL TRANSMISSION - SOLENOID SWITCH VALVE STUCK
TCM - LR PRESSURE SWITCH

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing transmission symptom diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. P1775-SOLENOID SWITCH VALVE LATCHED IN TCC POSITION — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, check for other transmission DTC's Is the DTC P0841 present also? Yes → Refer to symptom list and perform test for P0841. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	5-SPD AUTO-MATIC 5-45RFE TRANS
3	Perform a visual inspection of all connectors, wiring, and cooler connections before proceeding. Repair as necessary. With the DRBIII®, Check the STARTS SINCE SET counter. **NOTE: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter for P1775 at 2 or less? Yes → Go To 4 No → Go To 11	5-SPD AUTO-MATIC 5-45RFE TRANS
4	Turn the ignition off to the lock position. Remove the Starter Relay from the PDC. **NOTE: Failure to remove the Starter Relay can cause a TCM - No Response condition.** Install the Transmission Simulator, Miller tool #8333. **Note: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. With the Transmission Simulator, turn the Pressure Switch selector switch to LR. With the DRBIII®, monitor the LR Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator. Did the state of the UD Pressure Switch change while pressing the Pressure Switch Test button? Yes → Go To 5 No → Go To 6	5-SPD AUTO-MATIC 5-45RFE TRANS
5	If there are no possible causes remaining, view repair. Repair Repair internal transmission as necessary. Inspect the Solenoid Switch Valve per the Service Information and repair or replace as necessary. If no problems are found, replace the Transmission Solenoid/TRS Assembly. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS
6	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid /TRS Assembly harness connector **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the LR Pressure Switch Sense circuit from the TCM harness connector to the Solenoid/TRS Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the LR Pressure Switch Sense circuit for an open. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 7	5-SPD AUTO-MATIC 5-45RFE TRANS

P1775-SOLENOID SWITCH VALVE LATCHED IN TCC POSITION — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off to the lock position. Disconnect the Transmission Solenoid/TRS Assembly harness connector. Using a 12-volt test light connected to ground, check the Transmission Control Relay Output circuit in the Transmission Solenoid/TRS Assembly harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 8 No → Repair the Transmission Control Relay Output circuit for an open or high resistance. If the fuse is open make sure to check for a short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS
8	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/TRS Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the LR Pressure Switch Sense circuit. Is the resistance below 5.0 ohms? Yes → Repair the LR Pressure Switch Sense circuit short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 9	5-SPD AUTOMATIC 5-45RFE TRANS
9	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector. Ignition on, engine not running. Measure the voltage of the LR Pressure Switch Sense circuit in the TCM harness connector. Is the voltage above 0.5 volts? Yes → Repair the LR Pressure Switch Sense circuit for a short to voltage. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 10	5-SPD AUTOMATIC 5-45RFE TRANS
10	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS

P1775-SOLENOID SWITCH VALVE LATCHED IN TCC POSITION — Continued

TEST	ACTION	APPLICABILITY
11	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. This DTC can also be set by the SSV intermittently sticking in it's bore under extreme temperature conditions. Were there any problems found? Yes → Repair as necessary. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	5-SPD AUTOMATIC 5-45RFE TRANS

Symptom:
P1776-SOLENOID SWITCH VALVE LATCHED IN LR POSITION

When Monitored and Set Condition:

P1776-SOLENOID SWITCH VALVE LATCHED IN LR POSITION

When Monitored: Continuously when doing partial or full EMCC - PEMCC or FEMCC.

Set Condition: If the transmission senses the L/R pressure switch closing while performing PEMCC or FEMCC. This code will be set after two unsuccessful attempts to perform PEMCC or FEMCC. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES
TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN
RELATED DTC P0841 PRESENT
INTERMITTENT WIRING AND CONNECTORS
LR PRESSURE SWITCH SENSE CIRCUIT OPEN
LR PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND
LR PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
INTERNAL TRANSMISSION - SOLENOID SWITCH VALVE STUCK
TCM - LR PRESSURE SWITCH

TEST	ACTION	APPLICABILITY

P1776-SOLENOID SWITCH VALVE LATCHED IN LR POSITION — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, check for other transmission DTC's Is the DTC P0841 present also? Yes → Refer to symptom list and perform the appropriate test for DTC P1784. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	5-SPD AUTO-MATIC 5-45RFE TRANS
3	Perform a visual inspection of all connectors, wiring, and cooler connections before proceeding. Repair as necessary. With the DRBIII®, Check the STARTS SINCE SET counter. **NOTE: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter 2 or less? Yes → Go To 4 No → Go To 11	5-SPD AUTO-MATIC 5-45RFE TRANS
4	Turn the ignition off to the lock position. Remove the Starter Relay from the PDC. **NOTE: Failure to remove the Starter Relay can cause a TCM - No Response condition.** Install Transmission Simulator, Miller tool #8333. **Note: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. With the Transmission Simulator, turn the Pressure Switch selector switch to LR. With the DRBIII®, monitor the LR Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator. Did the state of the LR Pressure Switch change while pressing the Pressure Switch Test button? Yes → Go To 5 No → Go To 6	5-SPD AUTO-MATIC 5-45RFE TRANS
5	If there are no possible causes remaining, view repair. Repair Repair internal transmission problem as necessary. Inspect the Solenoid Switch Valve per the Service Information and repair or replace as necessary. If no problems are found, replace the Solenoid/TRS Assembly per the Service Information. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS

P1776-SOLENOID SWITCH VALVE LATCHED IN LR POSITION — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid /TRS Assembly harness connector **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the LR Pressure Switch Sense circuit from the TCM harness connector to the Solenoid/TRS Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the LR Pressure Switch Sense circuit for an open. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 7	5-SPD AUTOMATIC 5-45RFE TRANS
7	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/TRS Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the LR Pressure Switch Sense circuit. Is the resistance below 5.0 ohms? Yes → Repair the LR Pressure Switch Sense circuit for a short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	5-SPD AUTOMATIC 5-45RFE TRANS
8	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and Transmission Control Relay Output circuit in the Transmission Control Relay connector. Ignition on, engine not running. Disconnect the Transmission Solenoid/TRS Assembly harness connector. Measure the voltage of the L/R Pressure Switch Sense circuit in the TCM harness connector. Is the voltage above 0.5 volt? Yes → Repair the LR Pressure Switch Sense circuit for a short to voltage. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 9	5-SPD AUTOMATIC 5-45RFE TRANS
9	Turn the ignition off to the lock position. Disconnect the Transmission Solenoid/TRS Assembly harness connector. Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Transmission Control Relay Output circuit in the Transmission Solenoid/TRS Assembly harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 10 No → Repair the Transmission Control Relay Output circuit for an open or high resistance. If the fuse is open make sure to check for a short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS

P1776-SOLENOID SWITCH VALVE LATCHED IN LR POSITION — Continued

TEST	ACTION	APPLICABILITY
10	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS
11	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. This DTC can also be set by the Solenoid Switch Valve intermittently sticking in it's bore under extreme temperature conditions. Were there any problems found? Yes → Repair as necessary. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	5-SPD AUTOMATIC 5-45RFE TRANS

Symptom:
P1790-FAULT IMMEDIATELY AFTER SHIFT

When Monitored and Set Condition:

P1790-FAULT IMMEDIATELY AFTER SHIFT

When Monitored: After a speed ratio error is stored.

Set Condition: This code is set if the associated speed ratio code is stored within 1.3 seconds after a shift.

POSSIBLE CAUSES
FAULT AFTER SHIFT

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing transmission symptom diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSB's related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	This DTC is set along with a speed ratio DTC. Perform the appropriate test for the Speed Ratio DTC stored. Check 1 trip failures if there are no speed ratio codes current. If there are no possible causes remaining, view repair. Repair This code is set if an associated speed ratio code is stored within 1.3 seconds after a shift. Perform the appropriate speed ratio DTC test. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS

Symptom:
P1793-TRD LINK COMMUNICATION ERROR

When Monitored and Set Condition:

P1793-TRD LINK COMMUNICATION ERROR

When Monitored: During torque managed shifts with Throttle angle above 54 degrees. This system is also tested whenever the vehicle is stopped and the engine speed is below 1000 RPM.

Set Condition: This code is set when the Transmission Control Module sends two subsequent Torque Reduction messages (pulses the TRD ckt to ground) to the Powertrain Control Module via the TRD link circuit and the TCM does not receive a confirmation from the PCM over the communication bus.

POSSIBLE CAUSES
RELATED DTC'S PRESENT
INTERMITTENT WIRING & CONNECTORS
TORQUE MANAGEMENT REQUEST SENSE CIRCUIT OPEN
TORQUE MANAGEMENT REQUEST SENSE CIRCUIT SHORT TO GROUND
TORQUE MANAGEMENT REQUEST SENSE CIRCUIT SHORTED TO VOLTAGE
PCM - TRD LINK COMMUNICATION ERROR
TCM - TRD LINK COMMUNICATION ERROR

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing transmission symptom diagnostics. With the DRBIII®, read Transmission DTC's. P1793-TRD LINK COMMUNICATION ERROR — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, check for other transmission DTC's Are any of the DTCs P1694, P0731, P0732, P0733, P0734, or P1736 present also? Yes → If any of these DTCs are present, disregard the P1793 DTC. Refer to the symptom list and perform the diagnostics for the other DTC's first. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	5-SPD AUTOMATIC 5-45RFE TRANS
3	With the DRBIII®, Check the STARTS SINCE SET counter. **NOTE: This counter only applies to the last DTC set.** Is the STARTS SINCE SET equal to zero? Yes → Go To 4 No → Go To 9	5-SPD AUTOMATIC 5-45RFE TRANS
4	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the PCM harness connector(s). **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the Torque Management Request Sense circuit from the TCM harness connector to the PCM harness connector. Is the resistance above 5.0 ohms? Yes → Repair the open Torque Management Request Sense circuit. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	5-SPD AUTOMATIC 5-45RFE TRANS
5	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the PCM harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the Torque Management Request Sense circuit. Is the resistance below 5.0 ohms? Yes → Repair the Torque Management Request Sense circuit for a short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 6	5-SPD AUTOMATIC 5-45RFE TRANS

P1793-TRD LINK COMMUNICATION ERROR — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off to the lock position. Disconnect the TCM harness connector. **Note: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. Measure the voltage of the Torque Management Request Sense circuit in the TCM harness connector. Is the voltage above 10.5 volts? Yes → Repair the Torque Management Request Sense circuit for a short to voltage. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 7	5-SPD AUTOMATIC 5-45RFE TRANS
7	Turn the ignition switch to the lock position. Disconnect the TCM harness connector. **Note: Check connectors - Clean/repair as necessary.** Turn the ignition on. Measure the voltage of the Torque Management Request Sense circuit in the TCM connector. Is the voltage above 7.0 volts? Yes → Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	5-SPD AUTOMATIC 5-45RFE TRANS
8	If there are no possible causes remaining, view repair. Repair Replace the Powertrain Control Module. Perform POWERTRAIN VERIFICATION TEST VER - 2.	5-SPD AUTOMATIC 5-45RFE TRANS
9	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. Were any problems found? Yes → Repair as necessary. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	5-SPD AUTOMATIC 5-45RFE TRANS

Symptom:
P1794-SPEED SENSOR GROUND ERROR

When Monitored and Set Condition:

P1794-SPEED SENSOR GROUND ERROR

When Monitored: The gear ratio is monitored continuously while the Transmission is in gear.

Set Condition: After a TCM reset in neutral and a ratio of input to output, of 1 to 2. This DTC can take up to five minutes of problem identification before illuminating the MIL.

POSSIBLE CAUSES
INTERMITTENT WIRING AND CONNECTORS
SPEED SENSOR GROUND CIRCUIT OPEN
SPEED SENSOR GROUND CIRCUIT SHORT TO GROUND
SPEED SENSOR GROUND CIRCUIT SHORT TO VOLTAGE
TCM - SPEED SENSOR GROUND CIRCUIT

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing transmission symptom diagnostics. With the DRBIII®, read Transmission DTC's. Refer to the Service Information for the proper repair procedure for components related to the 2C clutch. A broken or weak return spring or a dislocated snap ring could cause this problem. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS
4	**NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.** Perform eight learnable starts. A learnable start is defined as follows: Start engine. From a standstill, accelerate lightly to 80 km/h or 50 MPH, then brake lightly to a stop. Turn off engine. With the DRBIII®, record the CL VOL INDEX (CVI) for all clutches With the DRBIII®, perform a BATTERY DISCONNECT. With the DRBIII®, read the CVI's and compare them to the readings recorded before the BATTERY DISCONNECT. Are any of the CVI's less than 5 or different than before the BATTERY DISCONNECT? Yes → Go To 5 No → Test Complete.	5-SPD AUTOMATIC 5-45RFE TRANS
5	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS

Symptom:
P2702-INADEQUATE ELEMENT VOLUME OD

When Monitored and Set Condition:

P2702-INADEQUATE ELEMENT VOLUME OD

When Monitored: Whenever the engine is running. The OD volume is updated during a 2-3 upshift with throttle angle between 10 and 54 degrees. Trans temp must be at least 43 C (110 F)

Set Condition: When the OD volume falls below 5.

POSSIBLE CAUSES
INTERNAL TRANSMISSION - O/D CLUTCH VOLUME INDEX LOW
TCM- OD CLUTCH VOLUME INDEX LOW

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTC's. Check and repair all engine DTC's prior to performing transmission symptom diagnostics. With the DRBIII®, read Transmission DTC's. Record all DTC's and 1 Trip Failures. **NOTE: Diagnose 1 Trip Failures as a fully matured DTC.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal. For Gear Ratio DTC's, check and record all CVI's. Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSB's related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	With the DRBIII®, erase DTC″s **NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.** Drive the vehicle and perform at least ten 2-3 upshifts with the throttle between 10 and 54 TPS DEGREES. With the DRBIII®, read the OD CL VOL INDEX. Is the OD CL VOL INDEX below 10? Yes → Go To 3 No → Go To 4	5-SPD AUTO-MATIC 5-45RFE TRANS

P2706-MS SOLENOID CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, check for other transmission DTC's. Are there any Transmission Control Relay related DTCs P0890, P0891, and/or P0888 present? Yes → Refer to symptom list and perform test for Transmission Control Relay related DTCs. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	5-SPD AUTOMATIC 5-45RFE TRANS
3	With the DRBIII®, Check the STARTS SINCE SET counter for P2706. **NOTE: This counter only applies to the last DTC set.** Is the STARTS SINCE SET counter for P2706 set at 0? Yes → Go To 4 No → Go To 11	5-SPD AUTOMATIC 5-45RFE TRANS
4	Turn the ignition off to the lock position. Remove the Starter Relay from the PDC. **NOTE: Failure to remove the Starter Relay can cause a TCM - No Response condition.** Install the Transmission Simulator, Miller tool #8333. **Note: Check connectors - Clean/repair as necessary.** Ignition on, engine not running.. With the DRBIII®, actuate the MS Solenoid. Monitor the MS Solenoid LED on the Transmission Simulator. Did the LED on the Transmission Simulator blink on and off? Yes → Go To 5 No → Go To 6	5-SPD AUTOMATIC 5-45RFE TRANS
5	If there are no possible causes remaining, view repair. Repair Replace Transmission Solenoid/TRS Assembly as required. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS
6	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid /TRS Assembly harness connector **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the MS Solenoid Control circuit between the TCM harness connector to the Transmission Solenoid/TRS Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the MS Solenoid Control circuit for an open. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 7	5-SPD AUTOMATIC 5-45RFE TRANS

P2706-MS SOLENOID CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off to the lock position. Disconnect the Transmission Solenoid/TRS Assembly harness connector. Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Transmission Control Relay Output circuit in the Solenoid/TRS harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 8 No → Repair the Transmission Control Relay Output circuit for an open. If the fuse is open make sure to check for a short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS
8	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/TRS Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the MS Solenoid Control circuit. Is the resistance below 5.0 ohms? Yes → Repair the MS Solenoid Control circuit for a short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 9	5-SPD AUTOMATIC 5-45RFE TRANS
9	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid/TRS Assembly harness connector. Remove the Transmission Control Relay from the PDC. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between the Fused B+ circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector. Ignition on, engine not running. Measure the voltage of the MS Solenoid Control circuit in the TCM harness connector. Is the voltage above 0.5 volt? Yes → Repair the MS Solenoid Control circuit for a short to voltage. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 10	5-SPD AUTOMATIC 5-45RFE TRANS
10	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. WITH THE DRBIII® PERFORM QUICK LEARN Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS

P2706-MS SOLENOID CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
11	The conditions necessary to set this DTC are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Check for any applicable TSB that may apply. Wiggle the wires while checking for shorts or open circuits. Were there any problems found? Yes → Repair as necessary. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	5-SPD AUTOMATIC 5-45RFE TRANS

Symptom:
*BACKUP LAMPS COME ON WHILE SHIFTER IS NOT IN REVERSE POSITION

POSSIBLE CAUSES
BACKUP SUPPLY CIRCUIT SHORT TO VOLTAGE
TRANSMISSION RANGE SENSOR

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. Firmly apply brakes. Place the Shift Lever in the position which causes the Backup Lamps to come on at the wrong time. Do the Backup Lamps come while the shifter is not in Reverse? Yes → Go To 2 No → Test Complete.	5-SPD AUTO-MATIC 5-45RFE TRANS
2	Ignition on, engine not running. Place the shift lever in a position that causes the Backup Lamps to come on when they should not. Disconnect the Transmission Solenoid /TRS Assembly harness connector. **NOTE: This will cause a DTC to be stored in the TCM. They must be erased before returning the vehicle to the customer.** Did the Backup Lamps go out when the connector was disconnected? Yes → Go To 3 No → Go To 4	5-SPD AUTO-MATIC 5-45RFE TRANS
3	If there are no possible causes remaining, view repair. Repair Replace Transmission Solenoid/TRS Assembly as required. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS
4	Turn the ignition off to the lock position. Disconnect the Transmission Solenoid/TRS Assembly harness connector. Ignition on, engine not running. Measure the voltage of the Backup Light Supply circuit in the Solenoid/TRS harness connector. Is the voltage above 0.5 volt? Yes → Repair the Backup Lights Supply circuit for a short to voltage. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	5-SPD AUTO-MATIC 5-45RFE TRANS

Symptom:
*BACKUP LAMPS INOPERATIVE

POSSIBLE CAUSES
BACK UP LAMP GROUND CIRCUIT OPEN
BACKUP LAMP SUPPLY CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
BACKUP LAMP SUPPLY CIRCUIT SHORT TO GROUND
OPEN BACKUP LAMP BULBS
TRANSMISSION RANGE SENSOR

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. Place foot firmly on brake pedal. Place the shift lever in the reverse position. Do either of the Backup Lamps work? Yes → Test Complete. No → Go To 2	5-SPD AUTOMATIC 5-45RFE TRANS
2	Turn the ignition off to the lock position. Install Transmission Simulator Miller tool #8333. Ignition on, engine not running. Press the Reverse Light Test button on the Transmission Simulator while observing the Backup Lamps. Do either of the Backup Lamps come on? Yes → Go To 3 No → Go To 4	5-SPD AUTOMATIC 5-45RFE TRANS
3	If there are no possible causes remaining, view repair. Repair Replace Transmission Solenoid/TRS Assembly as required.	5-SPD AUTOMATIC 5-45RFE TRANS
4	Remove the Backup Lamp bulb. Using a 12-volt test light connected to 12-volts, check the Backup Lamp ground circuit. Does the light illuminate brightly? Yes → Go To 5 No → Repair the bad ground circuit to the Back up Lamp bulb socket.	5-SPD AUTOMATIC 5-45RFE TRANS
5	Remove both Backup Lamp bulbs. Measure the resistance of both Backup Lamp bulbs. Is the resistance above 5.0 ohms for either Backup Lamp bulbs? Yes → Replace the Backup Lamp bulb or bulbs as required. No → Go To 6	5-SPD AUTOMATIC 5-45RFE TRANS

*BACKUP LAMPS INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off to the lock position. Remove the Backup Lamp bulb. Disconnect the Transmission Solenoid /TRS Assembly harness connector. Measure the resistance of the Backup Lamp Supply circuit from the Backup lamp Socket to the Solenoid/TRS connector. Is the resistance above 5.0 ohms? Yes → Repair the Backup Lamp circuit for an open. No → Go To 7	5-SPD AUTOMATIC 5-45RFE TRANS
7	Turn the ignition off to the lock position. Disconnect the Transmission Solenoid /TRS harness connector. Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Fused Ignition Switch Output circuit. Does the light illuminate brightly? Yes → Go To 8 No → Repair the Fused Ignition Switch Output circuit for an open. Check fuse and replace, if necessary repair cause of open fuse. Possible short to ground or excessive resistance.	5-SPD AUTOMATIC 5-45RFE TRANS
8	Turn the ignition off to the lock position. Remove the Backup Lamp bulb. Disconnect the Transmission Solenoid/TRS connector. Measure the resistance between the Backup Lamp Supply circuit and ground. Is the resistance below 5.0 ohms? Yes → Repair the Backup Supply Lamp circuit for a short to ground.. Check fuse and replace if necessary. No → Test Complete.	5-SPD AUTOMATIC 5-45RFE TRANS

Symptom:
*BUMP FELT SHORTLY AFTER STOP WITH NO DTC'S PRESENT

POSSIBLE CAUSES
STICKING SLIP JOINT

TEST	ACTION	APPLICABILITY
1	This condition is normally caused by a stick and slip condition between the prop shaft slip joint and the transfer case output shaft. If there are no possible causes remaining, view repair. Repair Check for TSB's relating to this condition.	5-SPD AUTOMATIC 5-45RFE TRANS

Symptom:

*BUMP FELT WHILE COASTING IN NEUTRAL WITH NO DTC'S PRESENT

TEST	ACTION	APPLICABILITY
1	Check for a TCM flash update or TSB to address this issue. Perform the drive learn procedure for the LR clutch element. **NOTE: Some bump while coasting in neutral is normal.** Perform the above procedures to reduce excessive bump in neutral. Repair Test Complete.	5-SPD AUTOMATIC 5-45RFE TRANS

Symptom:
*CHECKING PARK/NEUTRAL SWITCH OPERATION

POSSIBLE CAUSES
INTERMITTENT WIRING AND CONNECTORS
PARK/NEUTRAL SWITCH SENSE CIRCUIT OPEN
PARK/NEUTRAL SWITCH SENSE CIRCUIT SHORT TO GROUND
PARK/NEUTRAL POSITION SWITCH
POWERTRAIN CONTROL MODULE - PARK NEUTRAL SWITCH

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. With the DRBIII®, monitor the PNP Switch Input status. Move the gear selector through all gear positions, Park to 1st and back to Park. Did the DRB display P/N and D/R in the correct gear positions? Yes → Go To 2 No → Go To 3	5-SPD AUTO-MATIC 5-45RFE TRANS
2	The condition is not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. Were there any problems found? Yes → Repair as necessary. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	5-SPD AUTO-MATIC 5-45RFE TRANS
3	Turn the ignition off to the lock position. Disconnect the PCM harness connector. Disconnect the PNP Switch harness connector. **Check connectors - Clean/repair as necessary** Measure the resistance of the PNP Switch Sense circuit between the PCM harness connector and the PNP Switch harness connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the PNP switch sense circuit for an open. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS
4	Ignition on, engine not running. Disconnect the PCM harness connector. Disconnect the PNP Switch harness connector. **Check connectors - Clean/repair as necessary** Measure the resistance between the PNP Switch Sense Circuit and ground. Is the resistance below 5.0 ohms? Yes → Repair the PNP switch sense circuit for a short to ground. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	5-SPD AUTO-MATIC 5-45RFE TRANS

*CHECKING PARK/NEUTRAL SWITCH OPERATION — Continued

TEST	ACTION	APPLICABILITY
5	Turn the ignition off to the lock position. Disconnect the PCM harness connector. Check connectors - Clean/repair as necessary Move the gear selector through all gear positions, from Park to 1st and back. While moving the gear selector through the gear positions, measure the resistance between ground and the PNP Switch Sense circuit in the PCM harness connector. Did the display change from above 10.0 ohms to below 10.0 ohms? Yes → Go To 6 No → Replace the Park/Neutral Position Switch in accordance with the Service Information. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS
6	If there are no possible causes remaining, view repair. Repair Replace the Powertrain Control Module. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTO-MATIC 5-45RFE TRANS

Symptom:
*POOR SHIFT QUALITY

POSSIBLE CAUSES
POOR SHIFT QUALITY

TEST	ACTION	APPLICABILITY
1	Check the transmission fluid level per the service information. Is the fluid level ok? Yes → Test Complete. No → Correct the fluid level as necessary. Check and repair all leaks in the transmission if the fluid level is low. Note: This is one possible cause of poor shift quality. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS

Symptom:
*TRANSMISSION NOISY WITH NO DTC'S PRESENT

POSSIBLE CAUSES
INCORRECT FLUID LEVEL
INTERNAL TRANSMISSION PROBLEM - NOISY WHILE DRIVING
INTERNAL TRANSMISSION PROBLEM - NOISY WHILE STANDING STILL

TEST	ACTION	APPLICABILITY
1	Check and adjust the oil level per the service information before continuing. Place vehicle on hoist. Run vehicle on hoist under conditions necessary to duplicate the noise. Using Chassis Ears or other suitable device, verify that the noise is coming from the transmission. Is the noise coming from the transmission? Yes → Go To 2 No → Test Complete.	5-SPD AUTOMATIC 5-45RFE TRANS
2	Check the transmission fluid level per the Service Information. **NOTE: The transmission must be hot when checking oil level. When the temperature is below 10° Celsius 50° Fahrenheit it is possible that no oil will show on the dipstick, even though the transmission has an adequate fill level when warm.** Is the fluid level OK? Yes → Go To 3 No → Adjust fluid level. Repair cause of incorrect fluid level. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS
3	With the shift lever in neutral, raise the engine speed and listen to the noise. **Note: Make sure the radio is turned OFF. Alternator noise can come through the speakers and be misinterpreted as Transmission Pump Whine. This can happen even with the volume turned down, THE RADIO MUST BE TURNED OFF.** Does the noise get louder or change pitch while the engine speed is changing? Yes → Go To 4 No → Go To 5	5-SPD AUTOMATIC 5-45RFE TRANS
4	The transmission has an internal problem and must be replaced or repaired. If the transmission is to be repaired, inspect all of the transmission components for signs of wear. Pay particular attention to bearings in front half of transmission. If no problems found, replace oil pump.. If there are no possible causes remaining, view repair. Repair Replace transmission or repair internal transmission problem as necessary. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS

*TRANSMISSION NOISY WITH NO DTC'S PRESENT — Continued

TEST	ACTION	APPLICABILITY
5	View repair options. Repair Repair internal transmission problem as necessary. If the transmission is to be repaired, inspect all of the transmission components for signs of wear. Pay particular attention to bearings, pinion gears, etc. Repair or replace as necessary. Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.	5-SPD AUTOMATIC 5-45RFE TRANS

Symptom:

*TRANSMISSION SHIFTS EARLY WITH NO DTC'S

POSSIBLE CAUSES
COLD TRANSMISSION
BUS PROBLEMS
INTERMITTENT WIRING & CONNECTORS

TEST	ACTION	APPLICABILITY
1	If the transmission shifts too early when the transmission is cold, this is a normal condition. Did the problem occur when the transmission temperature was cold? Yes → The software is designed to protect the transmission from high torque and/or high RPM shifts during cold operation. No → Go To 2	5-SPD AUTOMATIC 5-45RFE TRANS
2	Using the DRBIII®, attempt communication with other Modules, check for signs of a bus problem such as bus related DTC's and/or communication problems. Although it takes two occurences of a missed TRD link message to set the fault code, one missed message will cause the transmission to short shift until the next start up. If the vehicle has any indications of a bus problem, the bus must be repaired first Do any of the other modules show signs of a bus problem? Yes → Refer to the appropriate category for the bus problem. No → Go To 3	5-SPD AUTOMATIC 5-45RFE TRANS
3	Using the schematics as a guide, inspect the wiring and connectors specific to the Torque Management Request Sense circuit. Wiggle the wires while checking for shorts and open circuits. Although it takes two occurences of a missed TRD link message to set the fault code, one missed message will cause the transmission to short shift until the next start up. If the vehicle has any indications of a bus problem, the bus must be repaired first Were any problems found? Yes → Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. No → Test Complete.	5-SPD AUTOMATIC 5-45RFE TRANS

Symptom:
*TRANSMISSION SHIFTS ROUGH AFTER TCM REPLACEMENT OR REFLASH

POSSIBLE CAUSES
TRANSMISSION SHIFTS ROUGH AFTER TCM REPLACEMENT OR REFLASH

TEST	ACTION	APPLICABILITY
1	Perform this procedure if the transmission shifts rough after TCM was replaced or Reflashed. Does the transmission shift rough after a TCM replacement or Reflash? Yes → Perform Quick Learn and the Drive Learn Procedure No → Test Complete.	5-SPD AUTOMATIC 5-45RFE TRANS

Symptom:
*TRANSMISSION SIMULATOR WILL NOT POWER UP

TEST	ACTION	APPLICABILITY
1	**Note: If the transmission simulator tool 8333 will not power up, this is a symptom of the transmission relay being open (such as Limp-in) and/or this also could be a indication of the trans simulator not installed correctly on the vehicle.** **Note: Check the simulator ground cable connection.** Repair these symptoms before having the transmission simulator 8333 repaired. Continue Test Complete.	5-SPD AUTOMATIC 5-45RFE TRANS

Symptom:
*VEHICLE IS SLUGGISH WITH NO DTC'S PRESENT

POSSIBLE CAUSES
ENGINE VISCOUS FAN
COLD TRANSMISSION
BUS PROBLEMS
INTERMITTENT WIRING & CONNECTORS

TEST	ACTION	APPLICABILITY
1	**NOTE: Engine viscous fan sticking can cause this complaint.** Check the engine viscous fan for proper operation per the service information. Does the engine fan operate correctly? Yes → Repair the engine viscous fan per the Service Information. No → Go To 2	5-SPD AUTOMATIC 5-45RFE TRANS
2	If the transmission shifts too early when the transmission is cold, this is a normal condition. Did the problem occur when the transmission temperature was cold? Yes → The software is designed to protect the transmission from high torque and/or high RPM shifts during cold operation. No → Go To 3	5-SPD AUTOMATIC 5-45RFE TRANS
3	With the DRBIII®, attempt communications with other Modules, check for signs of a bus problem such as bus related DTC's and/or communication problems. Although it takes two occurences of a missed TRD link message to set the fault code, one missed message will cause the transmission to short shift until the next start up. If the vehicle has any indications of a bus problem, the bus must be repaired first Do any of the other modules show signs of a bus problem? Yes → Refer to the appropriate category for the bus problem. No → Go To 4	5-SPD AUTOMATIC 5-45RFE TRANS
4	Using the schematics as a guide, inspect the wiring and connectors specific to the Torque Management Request Sense circuit. Wiggle the wires while checking for shorts and open circuits. Although it takes two occurences of a missed TRD link message to set the fault code, one missed message will cause the transmission to short shift until the next start up. If the vehicle has any indications of a bus problem, the bus must be repaired first Were any problems found? Yes → Repair as necessary. No → Test Complete.	5-SPD AUTOMATIC 5-45RFE TRANS

Verification Tests

45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1	APPLICABILITY
1. Connect the DRBIII® to the Data Link Connector. 2. Reconnect any disconnected components. 3. With the DRBIII®, erase DTC's. 4. With the DRBIII®, display Transmission Temperature. Start and run the engine until the Transmission Temperature is HOT above 43° Celsius 110° Fahrenheit. 5. Check the Transmission fluid and adjust if necessary. Refer to the Service Information for the Fluid Fill procedure. **6. NOTE: If the TCM has been replaced or if the transmission has been repaired or replaced it is necessary to perform the DRBIII® Quick Learn Procedure.** 7. Road test the vehicle. With the DRBIII®, monitor TPS. Make fifteen to twenty 1-2, 2-3, and 3-4 upshifts and (4 - 4prime for 545RFE only). 8. Perform these shifts from a standing start to 97 Km/h 60 MPH with a constant throttle opening of 20 to 25 degrees. 9. Below 40 Km/h 25 MPH, make five to eight wide open throttle kickdowns to 1st gear. Allow at least 5 seconds each in 2nd and 3rd gear between each kickdown. 10. Check for DTC's during the road test. **11. NOTE: Use the EATX OBDII task manager to run Good Trip time in each gear, this will confirm the repair and to ensure that the DTC has not re-matured.** Were any Trouble Codes set during the road test? Yes → Refer to the Symptom List for the appropriate diagnostic tests. No → Repair is complete.	All

POWERTRAIN VERIFICATION TEST VER - 2	APPLICABILITY
1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary. 2. If this verification procedure is being performed after a NO TROUBLE CODE repair, perform steps 3 and 4. 3. Check to see if the initial symptom still exists. If there are no trouble codes or the symptom no longer exists, the repair was successful and testing is complete. 4. If the initial or another symptom exists, the repair is not complete. Check all technical service bulletins or flash updates and return to Symptoms if necessary. 5. If this verification procedure is being performed after a DTC repair, perform steps 6 through 13. 6. Connect the DRBIII® to the data link connector. Using the DRBIII® erase any diagnostic trouble codes and reset all values. 7. If the PCM was not replaced, skip steps 8 through 10 and continue with the verification. 8. If the PCM was replaced the correct VIN and mileage must be programmed or a DTC will set in the ABS and Air Bag modules. In addition, if the vehicle is equipped with Sentry Key Immobilizer System (SKIS), Secret Key data must be updated to enable start. 9. For ABS and Air Bag systems: Enter correct VIN and Mileage in PCM. Erase codes in ABS and Air Bag modules. 10. For SKIM theft alarm: Connect DRBIII® to data link conn. Go to Theft Alarm, SKIM, Misc. and place SKIM in secured access mode, by using the appropriate PIN code for this vehicle. Select Update the Secret Key data. Data will be transferred from SKIM to PCM 11. Road test the vehicle. If the test is for an A/C DTC, ensure it is operating during the following test. 12. Drive the vehicle for at least 5 minutes at or around 64 Kmh (40 mph). Ensure the transmission shifts through all gears. At some point stop the vehicle and turn off the engine for at least 10 seconds. 13. With the DRBIII®, read DTCs. Are there any DTC(s) present? Yes → Check for any related Technical Service Bulletins and/or refer to the appropriate Symptom list (Diagnostic Procedure). No → Repair is complete.	5-SPD AUTO-MATIC 5-45RFE TRANS

Verification Tests — Continued

POWERTRAIN VERIFICATION TEST VER - 5	APPLICABILITY
1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary. 2. If any existing diagnostic trouble codes have not been repaired, go to the appropriate Symptom List and follow path specified. 3. Connect the DRBIII® to the data link connector. 4. Ensure the fuel tank has at least a quarter tank of fuel. Turn off all accessories. 5. If the PCM was not replaced skip steps 6 through 8 and continue the verification. 6. If the PCM was replaced, the correct VIN and mileage must be programmed or a DTC will set in the ABS and Air Bag modules. In addition, if the vehicle is equipped with Sentry Key Immobilizer Module (SKIM), Secret Key data must be updated to enable start. 7. For ABS and Air Bag systems: Enter correct VIN and Mileage in PCM. Erase codes in ABS and Air Bag modules. 8. For SKIM theft alarm: Connect DRBIII® to data link connectorto Theft Alarm, SKIM, Misc. and place SKIM in secured access mode by using the appropriate PIN code for this vehicle. Select Update the Secret Key data. Data will be transferred from SKIM to PCM. 9. If the Catalyst was replaced, with the DRBIII® go to the miscellaneous Menu Option ″Catalyst Replaced″ and press enter. 10. If a Comprehensive Component DTC was repaired, perform steps 11 and 13. If a Major OBDII Monitor DTC was repaired skip step 11 and continue the verification. 11. After the ignition has been off for at least 10 seconds, restart the vehicle and run 2 minutes. 12. With the DRBIII®, monitor the appropriate pre-test enabling conditions until all conditions have been met. Once the conditions have been met, switch screen to the appropriate OBDII monitor, (Audible beeps when the monitor is running). 13. If the conditions cannot be duplicated, erase all DTCs with the DRBIII®. Did the OBD II monitor run successfully and has the Good Trip Counter changed to one or more? Yes → Repair is complete. No → Check for any related Technical Service Bulletins and/or refer to the appropriate Symptoms list (Diagnostic Procedure).	5-SPD AUTOMATIC 5-45RFE TRANS

NOTES

1.0 INTRODUCTION

The procedures contained in this manual include all of the specifications, instructions, and graphics needed to diagnose W5J400 Electronic Automatic Transmission problems. The diagnostics in this manual are based on the failure condition or symptom being present at the time of diagnosis.

When repairs are required, refer to the appropriate volume of the service information for the proper removal and repair procedure.

READ THIS MANUAL BEFORE TRYING TO DIAGNOSE A VEHICLE TROUBLE CODE.

Diagnostic procedures change every year. New diagnostic systems may be added and/or carryover systems may be enhanced. It is recommended that you review the entire manual to become familiar with all new and changed diagnostic procedures.

1.1 SYSTEM COVERAGE

This diagnostic procedures manual covers all 2002 MY Grand Cherokee equipped with a W5J400 Automatic Transmission.

1.2 SIX -STEP TROUBLESHOOTING PROCEDURE

Diagnosis of the W5J400 electronic transmission is done in six basic steps:

Verification of complaint
Verification of any related symptoms
Symptom analysis
Problem isolation
Repair of isolated problem
Verification of proper operation

2.0 IDENTIFICATION OF SYSTEM

The W5J400 Transmission family can be identified by the presence of a 13 pin electrical connector, with a bayonet lock on the right hand side of the transmission. The connector is oriented horizontally.

3.0 SYSTEM DESCRIPTION AND FUNCTIONAL OPERATION

3.1 GENERAL DESCRIPTION

The W5J400 electronic transmission is an electronically controlled five speed transmission with a controlled slip torque converter. The W5J400 electronic transmission is a conventional transmission in that it uses hydraulically applied clutches to shift a planetary gear train. However, the electronic control system replaces many of the mechanical and hydraulic components used in conventional transmission valve bodies.

The ratios for the gear stages are obtained by 3 planetary gear sets. Fifth Gear is designed as an Overdrive with a high speed ratio. The gears are actuated electronically/hydraulically. The electronic control system enables precise adaptation of pressures to the respective operating conditions and to the engine output during a shift phase, which results in a significant improvement in shift quality.

3.2 FUNCTIONAL OPERATION

The W5J400 electronic transmission has a fully adaptive control system. The system performs its functions based on continuous real-time sensor and switch feedback information. In addition the TCM receives information from the PCM/ECM (engine management) and ABS (chassis systems) controllers over the CAN bus. The CAN bus is a high speed communication bus that allows real time control capability between various controllers. Most messages are sent every 20 milliseconds, this means critical information can be shared between the Transmission, Engine and ABS controllers. The CAN bus is a two wire bus with a CAN C Bus (+) circuit and a CAN C Bus (-) circuit. The CAN bus uses a twisted pair of wires in the harness to reduce the potential of radio and noise interference. The CAN bus also uses a 120 ohm terminating resistor in both the TCM and ABS modules. The module terminating resistance is measured across both CAN bus circuits at the TCM or ABS module, with the PCM/ECM, TCM and ABS modules disconnected.

The control system automatically adapts to changes in engine performance, vehicle speed, and transmission temperature variations to provide consistent shift quality. The control system ensures that clutch operation during upshifting and downshifting is more responsive without increased harshness. The TCM controls the actuation of solenoid valves for modulating shift pressure and gear change. The required pressure level is calculated from the load condition, engine speed. Power for the transmission system is supplied through the Shifter Assembly (no transmission control relay). The TCM is located in the center console of the vehicle.

The Transmission Control Module (TCM) continuously checks for electrical problems, mechanical problems, and some hydraulic problems. When a problem is sensed, the TCM stores a diagnostic trouble code (DTC). Some of these codes cause the transmission to go into ″limp-in″ or ″default″ mode. The W5J400 will default in the current gear position if a DTC is detected, then after a key cycle or shift to park the transmission will go into Limp-in, which is mechanical 2nd gear. Some DTC's may allow the transmission to resume normal operation (recover) if the detected problem goes away. Permanent limp-in DTC will recover when the key is cycled, but if the same DTC is detected for three key cycles the system will not recover and the DTC must be cleared from the TCM with the DRBIII® scan tool.

Once the DRBIII® is in the Transmission portion of the diagnostic program, it constantly monitors the TCM to see if the system is in limp-in mode. If the transmission is in limp-in mode, the DRBIII® will flash the red LED.

3.2.1 CONTROLLER MODES OF OPERATION

Permanent limp-in mode

When the TCM determines there is a non-recoverable condition present that will not allow proper transmission operation, it will place the transmission in permanent limp-in mode. When the condition occurs the TCM will turn off all solenoids as well as the solenoid supply output circuit. If this occurs while the vehicle is moving, the transmission will remain in the current gear until the ignition is turned off or shifter is placed in the ″P″ position. Once the shifter has been placed in ″P″ the Transmission will only allow 2nd gear operation. . If the problem occurs while the vehicle is not moving the transmission will only allow 2nd gear operation.

Temporary limp-in mode

This mode is the same as the permanent limp-in mode except if the condition is no longer present the system will resume normal operation. (Recoverable DTC)

Undervoltage limp-in mode

When the TCM detects that system voltage has dropped below 8.5 volts it will disable voltage dependant diagnostics and place the transmission in the temporary limp-in mode. When the TCM senses that the voltage has risen above 9.0 volts, normal transmission operation will be resumed.

Hardware Error Mode

When the TCM detects a major internal error the transmission will be placed in the permanent limp-in mode and cease all communication over the CAN bus. Once the TCM has entered this mode normal transmission operation will not resume until all DTC's are cleared from the TCM.

Loss of Drive

If the TCM detects a situation that has resulted or may result in a catastrophic engine or transmission failure, the transmission will be placed in the neutral position. Improper Ratio, Input Sensor Overspeed, or Engine Overspeed DTC's will cause the loss of drive.

Controlled Limp-in Mode

When a failure condition does not require the TCM to shut down the solenoid supply, but the failure is of a degree where the TCM will place the transmission into a predefined gear, there will be several shift performance issues. Examples of this are, with the transmission slipping the controller will attempt to place the transmission into third gear and maintain third gear for all forward drive conditions. Another example is some of the CAN bus message issues if the TCM does not receive required information from the Engine Controller, then default values are used which may result in poor transmission shift performance.

3.2.2 MIL ILLUMINATION

For failures detected by the Transmission Controller that result in the controller placing the transmission into a limp-in mode, except for System Overvoltage and System Undervoltage DTCs, the MIL will be illuminated. The Transmission Controller will inform the PCM/ECM over the CAN bus that a failure has occurred. The PCM/ECM will store one of two DTC's P0700 or P0702 depending on which transmission DTC is present and will illuminate the MIL. If the condition is removed and the failure becomes Stored (Intermittent), the Transmission controller will stop reporting that the DTC is active and the PCM/ECM will extinguish the MIL.

Note: The MIL will light when the problem is first detected and it will not go off until the next ignition cycle, after all problem conditions have been checked for their presence. This normally takes several minutes of driving.

3.2.3 FREEZE FRAME

The TCM will record up to two freeze frames for each DTC. When a failure is initially detected the controller will store the information for that DTC in the first Freeze Frame. On the next occurrence of the same DTC the controller will save the same DTC information in a second Freeze Frame. If the DTC occurs for a third time the freeze frame information from the second occurrence will be over written with the third occurrence of the DTC. Therefore, the controller will store the freeze frame information for the first and last occurrence for each DTC stored in memory. The freeze frame also allows higher priority DTCs to replace lower priority DTCs for diagnostic purposes.

The Freeze frame information is very useful in determining the conditions under which an intermittent DTC is setting. Use the reported Freeze Frame information to duplicate the DTC set conditions

Note: The turbine speed is calculated from the N2 and N3 input speed sensors. The N2 and N3 input speed sensors are both active in 2nd, 3rd, and 4th gears. The N3 input speed is not reported in1st and 5th gears and will not match the turbine speed.

Information provided in Freeze frame:

Time since ignition Cycle
Mileage (km)
Battery voltage
Trans oil temperature
Actual gear/ Target Gear
Output speed
Turbine speed
Shifter Position
Calculated Gear

3.2.4 SOLENOIDS

1-2/4-5 solenoid - The 1-2/4-5 solenoid is activated when the TCM determines that the transmission must shift into or out of 2nd gear or 5th gear. The solenoid is only activated during the shifting of the transmission. When the solenoid is activated, hydraulic pressure is applied to the proper shift elements in the transmission to allow the desired shift. Once the shift is completed, the solenoid is turned off.

2-3 solenoid - The 2-3 solenoid is activated when the TCM determines that the transmission must shift into or out of 3rd gear. The solenoid is only activated during the shifting of the transmission. When the solenoid is activated hydraulic pressure is applied to the proper shift elements in the transmission to allow the desired shift. Once the shift is completed, the solenoid is turned off.

3-4 solenoid - The 3-4 solenoid is activated when the TCM determines that the transmission must shift into or out of 4th gear. The solenoid is only activated during the shifting of the transmission. When the solenoid is activated, hydraulic pressure is applied to the proper shift elements in the transmission to allow the desired shift. Once the shift is completed, the solenoid is turned off.

TCC solenoid - The TCC solenoid is activated when the TCM determines that the Torque converter clutch should be activated. The TCC clutch is a variable slip torque clutch that allows control of torque converter slip from 5% to 95.5% of full TCC engagement. The clutch is controlled by the TCC solenoid which is pulse width modulated (PWM) to provide the desired amount of slip.

Shift Pressure Solenoid - The Shift Pressure Solenoid is activated when the TCM determines that a transmission shift is required. The solenoid is PWM controller to allow the proper amount of hydraulic pressure to the shift elements. The solenoid is only activated during the shifting of the transmission. When the solenoid is activated, hydraulic pressure is removed from the proper shift elements to allow the desired shift. Once the shift is completed, the solenoid is turned off.

Modulation pressure solenoid - The modulation pressure is always active. The solenoid is pulse width modulated (PWM) controlled and is used to modulate the hydraulic system pressure to the desired pressure.

3.2.5 TRANSMISSION COMPONENT DESCRIPTIONS

Shift Assembly

The Shift Selector is similar to the TRS found on other DaimlerChrysler products, but is located in the Shifter Assembly instead of the transmission. The Shift Selector switches transmit all selector lever positions to the TCM. Light Emitting Diodes (LED's) are used as a light source in order to display the current selector lever position and provide basic shifter lighting. The shifter also has a vehicle PCI bus circuit for communication with the cluster (electronic PRNDL display). The Reverse light switch is integrated into the shifter module and controls the reverse lights through a reverse lamp relay. The Brake Shift Interlock solenoid and Park lockout solenoid, are also part of the Shift Selector module and are controlled by the TCM. The shifter module also supplies all power to the transmission system.

Note: If there are no LEDS illuminated on the shifter and the vehicle will not start, the TCM has a no response check the shifter assembly power connections for loss of voltage or ground.

Park lockout

This feature prevents inadvertent selection of Park at speeds above approximately 10 km/h (6MPH). The Park lockout solenoid is part of the Shifter Assembly and is controlled by the TCM.

Reverse Lamp Relay

The Reverse Light Switch is integrated into the shifter module and controls the reverse lights through a reverse lamp relay. The reverse lamp relay is located in the engine compartment. The reverse light switch provides a ground, to the reverse lamp relay solenoid control circuit, which turns the reverse lights on.

Brake shift inter-lock

To prevent unauthorized shifting out of the park position, the Selector lever is locked in the Park position until the ignition key is turned to the run position and the brake pedal is pressed. This will allow the driver to shift out of the park position.

Trans temp sensor - P/N Switch circuit

The TCM will detect the selector lever in park and neutral positions. The TCM does this by monitoring the Transmission temperature sensor signal along with the shifter position signals. The P/N switch contact is operated by a cam located in the transmission which, opens a reed contact switch that is wired in series with the transmission temperature sensor. When the P/N contact switch is opened in park and neutral, the TCM senses a high transmission temperature. Confirming the P/N switch status. Note: In park or neutral, the TCM uses engine temperature (to avoid setting a DTC). The TCM sends a hardwired signal to the PCM/ECM that will allow the PCM/ECM controlled start circuit to engage in P or N only. The TCM also sends a P/N bus message to the PCM/ECM to confirm the P/N switch status.

NOTE: The Engine Controller will allow starting of the vehicle if either the bus or hardwired P/N signal is present.

Input Speed Sensors

The W5J400 transmission has two input speed sensors N2 and N3, both speed sensors are located on the valve body and report DTC's for the input speed sensors errors. The speed sensors are hall effect speed sensors that are used by the TCM to calculate the transmissions input speed. Since the input speed could not be measured directly, two of the drive elements are measured. Two input speed sensors were required because both drive elements are not active in all gears. The input sensors N2 and N3 will report the same input speed in gears 2nd, 3rd or 4th. If the N2 and N3 input speed signals are not the same in these gears then there is an issue with the transmission and the DTC Input Sensors Mismatch will be set.

The N3 input speed is not reported in 1st and 5th gears. The N2 sensor is not reported in Reverse. The Input Speed Sensor Overspeed is a rationality check that is intended to indicate a major transmission failure and will cause a loss of drive (place the transmission in Neutral)

Output Speed Sensor (ABS signal)

The W5J400 transmission does not have an output shaft speed sensor. The TCM uses the ABS (Antilock Brake System) Wheel Speed sensor information, it receives over the CAN bus, to calculate the transmissions output shaft speed. The TCM monitors the ABS system for functionality and reports ABS speed sensor and communication DTCs, which will affect proper transmission operation. The MIL will be requested if two or more wheel speed sensors are involved. If both rear wheel speeds are not valid, Temporary Limp-in mode is activated and backup value for wheel speeds will be used. The TCM also uses the Axle ratio and Transfer case position and Ratio when in 4 Low to calculate transmission output speed. The TCM knows what mode the T-Case is in at all times. This is accomplished by a sensor on the transfer case that is wired to the PCM/ECM. Some four-wheel drive applications require averaging all four wheel speed sensors to calculate an accurate output shaft speed. This is not required with the W5J400 transmission system, the front sensors are used for various other calculations (vehicle speed, transverse acceleration) etc.

3.2.6 TRANSMISSION OPERATION AND SHIFT SCHEDULING

The transmission covered in this manual has unique shift schedules depending on the temperature of the transmission oil. The transmission oil temperature has a decisive effect on the shift quality of the transmission. The shift schedule is modified to extend the life of the transmission while operating under extreme conditions and to improve driver comfort by modifying shift schedules.

The transmission oil temperature is measured with a Temperature Sensor on the W5J400 transmission. The Temperature Sensor is an integral component of the Transmission Solenoid assembly. If the Temperature Sensor is causing a problem, a DTC will be set in the TCM.

The transmission temperature sensor is wired in series with the Park /Neutral (P/N) switch. The P/N switch is also located in the transmission. The transmission temperature is only read by the TCM when the P/N switch closes while in the R, D, 4,3,2,1 position. When the shifter lever is in the park or neutral position, the P/N switch opens and the temperature being displayed is Engine temperature.

3.2.7 TRANSMISSION ADAPTIVES - INITIALIZE AND STORE

Initialize Adaptive - This TCM function should be used when a new transmission has been placed in the vehicle. This command will reset the TCM adaptive to the factory setting.

Store Adaptive - This command should be used after the vehicle has been test driven by the technician to store any learned adaptive changes that occurred during the test drive. During normal operation adaptive are updated every 10 minutes. Using this command the latest adaptive will be written to the TCM immediately.

3.3 DIAGNOSTIC TROUBLE CODES

Diagnostic trouble codes (DTC's) are codes stored by the Transmission Control Module (TCM) to help diagnose Transmission problems. They are viewed using the DRBIII® scan tool.

Always begin by performing a visual inspection of the wiring, connectors, cooler lines and the transmission. Any obvious wiring problems or leaks should be repaired prior to performing any diagnostic test procedures. Some engine driveability problems can be misinterpreted as a transmission problem. Ensure that the engine is running properly and that no PCM/ECM DTC's are present that could cause a transmission complaint.

If there is a communication SCI (K line) circuit problem, trouble codes will not be accessible until the problem is fixed. The DRBIII® will display an appropriate message. The following is a possible list of causes for a bus problem:

- open or short to ground/battery in SCI (K line) circuit.
- internal failure of any module or component connected to the SCI (K line) circuit

Each diagnostic trouble code is diagnosed by following a specific testing sequence. The diagnostic test procedures contain step-by-step instructions for determining the cause of a transmission diagnostic trouble code. Possible sources of the code are checked and eliminated one by one. It is not necessary to perform all of the tests in this book to diagnose an individual code. These tests are based on the problem being present at the time that the test is run.

If the TCM records a DTC that will adversely affect the vehicles transmission, it will request (via the communication bus) that the PCM/ECM illuminate the Malfunction Indicator Lamp (MIL). All transmission DTC's will be stored in the TCM.

3.3.1 ACTIVE (HARD) CODE

Any Diagnostic Trouble Code (DTC) that is set whenever the system or component is monitored is an Active code. This means that the problem is there every time the TCM checks that system or component. Some codes will set immediately at start up and others will require a road test under specific conditions to set the DTC. It must be determined if a code is Active (repeatable) or Stored (Intermittent) before attempting diagnosis.

3.3.2 STORED (INTERMITTENT) CODE

A diagnostic trouble code that is not there every time the TCM checks the circuit or function is a Stored (Intermittent) code. Problems that come and go like this are the most difficult to diagnose, they must be looked for under the specific conditions that cause them. If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status. A DTC status can be ″Active″ or ″Stored″ (Intermittent). Active is when the DTC is present in the controller and the transmission is in the particular mode of operation for that DTC. Stored means that the DTC occurred at some point, but is not currently present, or the conditions have not been right to check for the presence of the problem, when a DTC is classified as Stored (Intermittent), no TCM reaction is required.

3.3.3 EMERGENCY RUNNING FUNCTION

If DTCs occur, safe-driving conditions must be retained but full functionality of the transmission will be limited to avoid damaging the automatic transmission. In the event of certain DTCs the TCM switches to emergency running. The TCM will store the appropriate DTC codes and solenoids will be de-energized (turned off)

The transmission effects will be:

- The last gear shifted remains in that position
- The modulating pressure and shift pressure increase to maximum value
- The torque converter clutch is disengaged (turned off)

Shifting manually after a DTC detection

Note: The vehicle can still be shifted manually to 2nd or reverse gear.

To accomplish these shifts you must
Stop the vehicle
Turn the ignition off
Start the engine

Place the selector lever into D for 2nd gear

Place the selector lever into R for reverse gear

The emergency running function is retained until the DTC is eliminated or the stored DTC code is erased.

Stored (Intermittent) DTCs can be reset by cycling the ignition switch

3.3.4 ERROR STATUS

DRBIII® will display: **DTC (name)**
DTC Status (Active or Stored)
DTC I.D. (Number of DTC)

The TCM stores information for each DTC stored in memory. This information defines the status of a particular DTC.

DTC I.D.	For each DTC a unique error number is defined. These DTC ID numbers count linear starting with 1. The unique number is used to identify DTC's in the TCM.	
Error Status	Active or Stored	Active: The DTC is present at the time of and is current error status in error memory. Stored (intermittent) : A DTC becomes Stored (Intermittent), if it was previously stored in memory and DTC set conditions are not satisfied.
Error Counter	The error counter shows how often a DTC was detected, which means a change of a DTC to 'active' status happened (the error counter will be incremented each time that a failure is detected independent of ignition cycles) The error counter is only incremented and allows to distinguish whether a DTC is a Active or an Stored (intermittent) DTC. The error counter is the number of times the TCM detects the DTC, the counter starts at 0 and counts to 255 (the maximum value is 255).	
Warm-up-Cycle Counter	The warm-up cycle counter is incremented (conditions for this problem detection have been met) if an error did not occur during the current driving cycle. and if a value of 255 is reached the error may be deleted from error memory. The counter starts at 0 and counts to 255 (the maximum value is 255). The counter will be reset to 0 if the problem occurs again.	
Driving Cycle Since First Set	The Driving Cycle First Set - will count the number of times the vehicle has completed a driving cycle since the DTC was first set. The counter will count up to 255 starts or until cleared.	

*Driving Cycle - A driving cycle is set when the engine speed is greater than 450 rpm. If one of the errors 28, 37, 39 or 82 is present the driving cycle is incremented immediately.

3.3.5 TROUBLE CODE ERASURE

Diagnostic Trouble Codes can be erased in two ways. The first is to erase the DTC with the DRBIII® or scan tool. The second is if the DTC is no longer present, the DTC is reset by the TCM (after an ignition cycle), which will place the DTC in an intermittent status (Stored DTC).

When there are no diagnostic trouble codes stored in memory, the DRBIII® will display ″NO DTC's DETECTED″

3.3.6 LIST OF DIAGNOSTIC TROUBLE CODES

The TCM may report any of the following DTC's.

DTC ID	Name of Code	Limp-in	MIL
46,47,48,57, 58,59,60,61, 62,63,65, 66,67, 69	Internal Controller	YES[1]	ON
2 , 71	1-2/4-5 Solenoid Circuit	YES[1]	ON
3, 72	2-3 Solenoid Circuit	YES[1]	ON
4, 73	3-4 Solenoid Circuit	YES[1]	ON
5	TCC Solenoid Circuit	YES[1]	ON
6	Mod. Press Solenoid Circuit	YES[1]	ON
7	Shift Pressure Solenoid Circuit	YES[1]	ON
8	Park Lock Out Solenoid Circuit	NO	OFF
9	P/N Output Circuit	NO	OFF
10	Solenoid Supply Voltage	YES[1]	ON
11	Sensor Supply Voltage	YES[1]	ON
12	N2 Input Sensor Circuit	YES[2]	ON
13	N3 Input Sensor Circuit	YES[2]	ON
14	Input Sensors Mismatch	YES[2]	ON
15	Input Sensor Overspeed	LOSS of DRIVE	ON
17	Shifter Signal Invalid	YES[2]	ON
19	System Overvoltage	YES[2]	OFF
20	Trans Temp Sensor Shorted	NO	OFF
21	System Undervoltage	YES[3]	OFF
22	ABS RR Sensor Message	YES[2]	ON [4]
23	ABS LR Sensor Message	YES[2]	ON [4]
24	ABS RF Sensor Message	YES[2]	ON [4]
25	ABS LF Sensor Message	YES[2]	ON [4]
26	Engine APP/TPS Message	NO	OFF
27	Engine Torque Message Incorrect	NO	OFF
28	Engine RPM Message	NO	OFF
29	Engine Torque Message Incorrect	NO	OFF
31	Engine Torque Message Incorrect	NO	OFF
32	Engine Torque Message Incorrect	NO	OFF
33	ABS Brake Message	NO	OFF
35	Engine CAN Message Missing	NO	OFF
36	Engine CAN Message Missing	YES[2]	ON
37	CAN Bus Circuit	YES[2]	ON

DTC ID	Name of Code	Limp-in	MIL
38	ABS CAN Message Missing	YES[2]	ON
39	Engine CAN Message Missing	NO	OFF
43	Engine Temp Message	NO	OFF
44	Engine T-case Switch Message	YES[1]	ON
49	Engine Overspeed	LOSS of DRIVE	ON
50	Improper Ratio	LOSS of DRIVE	ON
51	Transmission Slipping	NO[5]	ON
52	TCC Stuck On	NO	OFF
53	TCC Over Temp	NO	OFF
54	Engine Torque Reduction	NO	OFF
55	Improper Gear	YES[2]	ON
56	Solenoid Supply/Watchdog	YES[6 then 1]	ON
74	Trans Temp Sensor-P/N switch circuit	NO	OFF
75	Trans Temp Sensor Erratic	NO	OFF
76	Internal Shifter failure	YES[2]	ON
81	ABS CAN Message Incorrect	YES[2]	ON
82	Engine CAN Message Missing	NO	OFF
83	Engine CAN Message Missing	YES[2]	ON
85	Engine CAN Message Incorrect	NO	OFF

Permanent Limp-in mode [1] Temporary Limp-in mode [2] Undervoltage Limp-in [3] MIL on if two or more sensors [4] Conditional limp-in [5] Hardware Error[6]

3.3.7 DTC DESCRIPTIONS

Name of code: Internal Controller (46,47,48,57,58,59,60,61,62,63,65,66,67,69)

When Monitored: Always monitored with system active at each ignition cycle.

Set Condition: This code is set whenever Transmission Control Module (TCM) senses an internal error.

Theory of Operation: The TCM is constantly monitoring it's internal processor. If an internal problem is detected, this DTC will be set. The TCM performs various internal tests to verify proper controller operation. When one of these tests fail the controller will enter Hardware Error mode and the controller should be replaced.

Transmission Effects: The MIL will illuminate and the transmission system will default to the Limp-in.

Possible causes:

- Solenoid DTC's will set the internal controller code (repair first before replacing TCM)
- TCM

Name of code: 1-2/4-5 Solenoid Circuit (2, 71)

When Monitored: Always monitored with system active at each ignition cycle, but only a short to ground will be detected without the engine running..

Set Condition: If the TCM detects a short to ground or battery on the solenoid control circuit, shorted solenoid, open solenoid, or an open or shorted solenoid control circuit driver in the TCM.

Theory of Operation: The 1-2/4-5 solenoid is activated when the TCM determines that the transmission must shift into or out of 2nd gear or 5th gear. The solenoid is only activated during the shifting of the transmission. When the solenoid is activated hydraulic pressure is applied to the proper shift elements in the transmission to allow the desired shift. Once the shift is completed the solenoid is turned off. Note: DTC ID 71 varies from DTC ID 2 in the manner that the DTC is detected. This detection method uses direct feed back to the microprocessor and not the diagnostic capabilities of the driver circuits. This detection method will only detect open circuits, shorts to ground and shorted drivers when the output is off and the engine is running.

Transmission Effects: The MIL will illuminate and the transmission will be placed in Permanent Limp-in until the ignition key is cycled. If three consecutive solenoid failures are detected by the TCM, the TCM will not retest the solenoid and place the transmission is Limp-in until the DTC is erased with the DRBIII®. If the DTC is reset (after an ignition cycle), the DTC will be set to Stored (Intermittent) status.

Possible causes:

- Solenoid circuit wiring
- Solenoid internal
- TCM

Name of code: 2-3 Solenoid Circuit (3, 72)

When Monitored: Always monitored with system active at each ignition cycle, but only a short to ground will be detected without the engine running.. Set condition:. If the TCM detects a short to ground or battery on the solenoid control circuit, shorted solenoid, open solenoid, or an open or shorted solenoid control circuit driver in the TCM.

Theory of Operation: The 2-3 solenoid is activated when the TCM determines that the transmission must shift into or out of 3rd gear. The solenoid is only activated during the shifting of the transmission. When the solenoid is activated hydraulic pressure is applied to the proper shift elements in the transmission to allow the desired shift. Once the shift is completed, the solenoid is turned off. Note: DTC ID 72 varies from DTC ID 3 in the manner that the DTC is detected. This detection method uses direct feed back to the microprocessor and not the diagnostic capabilities of the driver circuits. This detection method will only detect open circuits, shorts to ground and shorted drivers when the output is off and the engine is running.

Transmission Effects: The MIL will illuminate and the transmission will be placed in Permanent Limp-in until the ignition key is cycled. If three consecutive solenoid failures are detected by the TCM, the TCM will not retest the solenoid and places the transmission in Limp-in until the DTC is erased with the DRBIII®. If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status.

Possible causes:

- Solenoid circuit wiring
- Solenoid internal
- TCM

Name of code: 3-4 Solenoid Circuit (4, 73)

When Monitored: Always monitored with system active at each ignition cycle, but only a short to ground will be detected without the engine running.

Set Condition: If the TCM detects a short to ground or battery on the solenoid control circuit, shorted solenoid, open solenoid, or an open or shorted solenoid control circuit driver in the TCM.

Theory of Operation: The 3-4 solenoid is activated when the TCM determines that the transmission must shift into or out of 4th gear. The solenoid is only activated during the shifting of the transmission. When the solenoid is activated, hydraulic pressure is applied to the proper shift elements in the transmission to allow the desired shift. Once the shift is completed, the solenoid is turned off. Note: DTC ID 73 varies from DTC ID 4 in the manner that the DTC is detected. This detection method uses direct feed back to the microprocessor and not the diagnostic capabilities of the driver circuits. This detection method will only detect open circuits, shorts to ground and shorted drivers when the output is off and the engine is running.

Transmission Effects: The MIL will illuminate and the transmission will be placed in Permanent Limp-in until the ignition key is cycled. If three consecutive solenoid failures are detected by the TCM, the TCM will not retest the solenoid and places the transmission in Limp-in until the DTC is erased with the DRBIII®. If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status.

Possible causes:

- Solenoid circuit wiring
- Solenoid internal
- TCM

Name of code: TCC Solenoid Circuit (5)

When Monitored: Always monitored with system active at each ignition cycle. Solenoid inactive, Solenoid active and controlled above 25% duty cycle, Solenoid Supply Active.

Set Condition: If the TCM detects a short to ground or battery on the solenoid control circuit, shorted solenoid, open solenoid, or an open or shorted solenoid control circuit driver in the TCM.

Theory of Operation: The TCC solenoid is activated when the TCM determines that the Torque converter clutch should be activated. The TCC clutch is a variable slip torque clutch that allows control of torque converter slip from 5% to 95.5% of full TCC engagement. The clutch is controlled by the TCC solenoid which is pulse width modulated (PWM) to provide the desired amount of slip.

Transmission Effects: The MIL will illuminate and the transmission will be placed in Permanent Limp-in until the ignition key is cycled. If three consecutive solenoid failures are detected by the TCM, the TCM will not retest the solenoid and places the transmission in Limp-in until the DTC is erased with the DRBIII®. If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status.

Possible causes:

- Solenoid circuit wiring
- Solenoid internal
- TCM

Name of code: Mod. Press Solenoid Circuit (6)

When Monitored: Always monitored with system active at each ignition cycle. Solenoid off, Solenoid active with 25-75% duty cycle, Solenoid Supply Active

Set Condition: If the TCM detects a short to ground or battery on the solenoid control circuit, shorted solenoid, open solenoid, or an open or shorted solenoid control circuit driver in the TCM.

Theory of Operation: The modulation pressure is always active. The solenoid is pulse width modulated (PWM) controlled and is used to modulate the hydraulic system pressure to the desired pressure.

Transmission Effects: The MIL will illuminate and the transmission will be placed in Permanent Limp-in until the ignition key is cycled. If three consecutive solenoid failures are detected by the TCM, the TCM will not retest the solenoid and places the transmission in Limp-in until the DTC is erased with the DRBIII®. If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status

Possible causes:

- Solenoid circuit wiring
- Solenoid internal
- TCM

Name of code: Shift Pressure Solenoid Circuit (7)

When Monitored: When the solenoid is off, solenoid active with 25-75% duty cycle and/or the solenoid supply is active

Set Condition: If the TCM detects a short to ground or battery on the solenoid control circuit, shorted solenoid, open solenoid, or an open or shorted solenoid control circuit driver in the TCM.

Theory of Operation: The Shift Pressure Solenoid is activated when the TCM determines that a transmission shift is required. The solenoid is PWM controller to allow the proper amount of hydraulic pressure to the shift elements. The solenoid is only activated during the shifting of the transmission. When the solenoid is activated, hydraulic pressure is applied to the proper shift elements through one of the shift solenoids in the transmission to allow the desired shift. Once the shift is completed the solenoid is turned off.

Transmission Effects: The MIL will illuminate and the transmission will be placed in Permanent Limp-in until the ignition key is cycled. If three consecutive solenoid failures are detected by the TCM, the TCM will not retest the solenoid and places the transmission in Limp-in until the DTC is erased with the DRBIII®. If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status

Possible causes:

- Solenoid circuit wiring
- Solenoid internal
- TCM

Name of code: Park Lockout Solenoid Circuit (8)

When Monitored: When the solenoid is off and when the solenoid is active.

Set Condition: If the TCM detects a short to ground or battery on the solenoid control circuit, shorted solenoid, open solenoid, or an open or shorted solenoid control circuit driver in the TCM.

Theory of Operation: The Park lockout Solenoid is activated when vehicle speed is greater then 6 MPH to protect the transmission from inadvertently being shifted into Park while moving. The Park lock out solenoid is located in the Shifter assembly.

Transmission Effects: Transmission may be able to be shifted into Park when vehicle speed is above 6 MPH. The DTC is evaluated with each ignition cycle if the DTC is detected the solenoid is switched off until the ignition is cycled. If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status

Possible causes:

- Solenoid circuit wiring
- Solenoid
- TCM

Name of code: P/N Output Circuit (9)

When Monitored: Shifter is in park or neutral and the solenoid is active

Set Condition: Shifter is in park or neutral and the output is active

Theory of Operation: The Park/Neutral output is a hard wired connection to the Engine Controller. The TCM will activate this output when is detects that the Shifter is in the park or neutral position. The TCM will also send a P/N bus message to the PCM/ECM. The P/N switch is wired in series with the transmission temperature sensor and is open in park and neutral. This is a redundant signal as the PCM/ECM also receives a message over the CAN bus that provides the same information. The PCM/ECM will allow starting of the vehicle if either of these signals is present. NOTE: The Engine Controller will allow starting of the vehicle if either the bus or hardwired signal is present.

Transmission Effects: The vehicle may be able to be started in gear. Once set in the system, the output is switched off and the TCM will not reevaluate DTC until the ignition key is cycled. If the

DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status

Possible causes:

- P/N circuit wiring
- PCM/ECM
- TCM

Name of code: Solenoid Supply Voltage (10)

When Monitored: When the output is active and no under-voltage condition exists.

Set Condition: If the measured Solenoid Supply Voltage and measured battery voltage differ by 3.6 volts. (Watchdog DTC is set if short to B+)

Theory of Operation: The Solenoid Supply Voltage output of the TCM provides the voltage to the three shift solenoids, two pressure solenoids and TCC solenoids. The output is active whenever the system is in normal operation. If a major system DTC is detected this output is turned off to ensure that no solenoids are active.

Transmission Effects: The MIL will illuminate and the transmission will be placed in Permanent Limp-in until the ignition key is cycled. If three consecutive failures are detected by the TCM, the TCM will place the transmission is Limp-in until the DTC is erased with the DRBIII®. If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status

Possible causes:

- Short to B+ on any solenoid circuit
- Solenoid supply circuit
- Solenoid internal
- TCM

Name of code: Sensor Supply Voltage (11)

When Monitored: Always monitored with system active at each ignition cycle and no under-voltage condition exists.

Set Condition: If measured sensor voltage is not within specified limits 4.8-7.2 volts or if a problem with the regulator, Sensor Supply Voltage shorted to ground, Sensor Supply Voltage shorted to battery is detected.

Theory of Operation: The Sensor Supply Voltage output provides the 6.0V supply voltage to both input speed sensors. The output is active whenever the system is in operation.

Transmission Effects: The MIL will illuminate and the transmission will be placed in Permanent Limp-in until the ignition key is cycled. If three consecutive failures are detected by the TCM, the TCM will place the transmission is Limp-in until the DTC is erased with the DRBIII®. If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status

Possible causes:

- Sensor supply circuit
- Solenoid internal
- TCM

Name of code: N2 Input Sensor Circuit (12)

When Monitored: Engine speed greater than 450 rpm, no engine speed DTC's, no TCM under-voltage system operation, no output speed sensor DTC's (signal from the ABS system), all wheel speeds above 250 rpm (signal from the ABS system), no rear wheel speed DTC's (signal from the ABS system), and no wheel slip detected (signal from the ABS system).

Set Condition: If the N2 input speed sensor is equal to 0 rpm or a short to ground, short to battery open input speed sensor, input speed sensor, open sensor supply circuit.

Theory of Operation: The N2 Input Speed Sensor is one of two hall effect speed sensors that are used by the TCM to calculate the transmissions input speed. Since the input speed could not be measured directly two of the drive elements are measured. Two input speed sensors were required because both drive elements are not active in all gears.

Transmission Effects: The MIL will illuminate and the transmission will be placed in Temporary Limp-in until the ignition key is cycled. If three consecutive failures are detected by the TCM, the TCM places the transmission in Limp-in until the DTC is erased with the DRBIII®. The TCM will use a back up value for the N2 input speed sensor of 8000 rpm. If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status.

Possible causes:

- Sensor circuit wiring
- Open Sensor Supply Circuit
- Solenoid internal
- TCM

Name of code: N3 Input Sensor Circuit (13)

When Monitored: Engine speed greater than 450 rpm, no engine speed DTC's, no TCM under-voltage system operation, no output speed sensor DTC's (signal from the ABS system), all wheel speeds above 250 rpm (signal from the ABS system), no rear wheel speed DTC's (signal from the ABS system), and no wheel slip detected (signal from the ABS system), no shifting operation, detected gear is 3rd or 4th and the detected gear is the actual vehicle gear.

Set Condition: If the N3 input speed sensor is equal to 0 rpm or a short to ground, short to battery open input speed sensor, input speed sensor, open sensor supply circuit.

Theory of Operation: The N3 Input Speed Sensor is one of two Hall effect speed sensors that are used by the TCM to calculate the transmissions input speed. Since the input speed could not be measured directly two of the drive elements are measured. Two input speed sensors were required because both drive elements are not active in all gears.

Transmission Effects: The MIL will illuminate and the transmission will be placed in Temporary Limp-in until the ignition key is cycled. If three consecutive failures are detected by the TCM, the TCM places the transmission in Limp-in until the DTC is erased with the DRBIII®. The TCM will use a back up value for the N3 input speed sensor of 8000 rpm. If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status

Possible causes:

- Sensor circuit wiring
- Open Sensor Supply Circuit
- Solenoid internal
- TCM

Name of code: Input Sensors Mismatch (14)

When Monitored: Engine speed greater than 450 rpm, no engine speed DTC's, no TCM under-voltage system operation, no output speed sensor DTC's (signal from the ABS system), all wheel speeds above 250 rpm (signal from the ABS system), no rear wheel speed DTC's (signal from the ABS system), and no wheel slip detected (signal from the ABS system), no shifting operation, N3 input speed sensor greater than 800 rpm and N2 input speed sensor greater than 0 rpm and the TCM not in reset.

Set Condition: If the speed difference between the N2 and N3 input speed sensors is greater than 150 rpm.

Theory of Operation: The N2 and N3 Input Speed Sensors will report the same speed in gears 2,3 or 4. If these signals are not the same in these gears then there is an issue with the transmission.

Transmission Effects: The MIL will illuminate and the transmission will be placed in Temporary Limp-in until the ignition key is cycled. If three consecutive failures are detected by the TCM, the TCM places the transmission in Limp-in until the DTC is erased with the DRBIII®. The TCM will use a back up value for the N2 and N3 input speed sensors of 8000 rpm. If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status

Possible causes:

- Transmission internal
- Solenoid internal
- TCM

Name of code: Input Sensor Overspeed (15)

When Monitored: Whenever the N2 input speed sensor is greater than 0 rpm

Set Condition: If the rpm of the N2 or N3 input speed sensor is greater than 7700 rpm

Theory of Operation: The rationality check is intended to indicate a catastrophic transmission failure. The MIL will illuminate and the transmission will be placed in neutral until the ignition key is cycled. If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status

Transmission Effects: Loss of drive and the transmission will shift to neutral

Possible causes:

- Transmission internal
- TCM

Name of code: Shifter Signal Invalid (17)

When Monitored: Always monitored with system active at each ignition cycle and no under-voltage condition exists

Set Condition: The Shifter detects an invalid code, shifter failure, TCM failure, Short to ground, open circuit or short to battery on one of the five circuits.

Theory of Operation: This transmission does not have a Range Sensor internally. The customer requested gear must be communicated by the shifter module to the TCM. This is accomplished by five circuits, which send a gray code to the transmission controller. If this gray code is incorrect, this DTC is set. The shifter sense circuits communicate the shift lever position to the TCM. Each circuit is terminated at the shifter. Each circuit can be either HI or LO, depending on the shift lever position. The TCM can decode this information and determine the shift lever position. Each shift lever position has a certain combination of circuits, which will be HI and LO, this is called a PRNDL code. There are five circuits, therefore: there are many possible combinations of HI and LO circuit (codes). The following chart shows the normal switch states for each shift lever position.

PRNDL SWITCH INPUTS FROM THE SHIFTER

Switch	**Park**	**T1**	**Rev**	**T2**	**N**	**T3**	**D**	**4**	**3**	**2**	**1**
C1	HI	LO	LO	LO	HI	HI	LO	LO	LO	HI	HI
C2	HI	HI	HI	LO	LO	LO	LO	LO	HI	LO	HI
C3	HI	HI	HI	HI	HI	LO	HI	LO	LO	LO	LO
C4	LO	LO	HI	HI	HI	HI	LO	HI	LO	LO	HI
C5	LO	HI	LO	HI	LO	HI	LO	LO	LO	LO	LO
HI = 12 volts LO = 0 volts

3.	C2 Stuck	Open
4.	C2 Stuck	Closed
5.	C3 Stuck	Open
6.	C3 Stuck	Closed
7.	C4 Stuck	Open
8.	C4 Stuck	Closed
9.	C5 Stuck	Open
10.	C5 Stuck	Closed

Transmission Effects: The MIL will illuminate and the transmission will be placed in Temporary Limp-in until the ignition key is cycled. If three consecutive failures are detected by the TCM, the TCM will place the transmission in Limp-in until the DTC is erased with the DRBIII®. If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status

Possible causes:

- Shifter circuit wiring
- Internal Shifter
- TCM

Name of code: System Overvoltage (19)

When Monitored: Always monitored with system active at each ignition cycle.

Set Condition: Ignition voltage above 16.9 volts with the engine and transmission input speed sensors above 2000 rpm for 60 seconds

Theory of Operation: The TCM monitors the ignition voltage that it is supplied. This DTC is set when the monitored voltage raises above a threshold. Temporary limp-in mode will be activated when the voltage reaches the threshold, but the System Overvoltage DTC will not be saved unless the engine speed and transmission input speed is greater then 2000 RPM for 60 seconds. The system will recover if the ignition voltage drops below 16.4 volts.

Transmission Effects: The transmission will be placed in Temporary Limp-in. If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status

Possible causes:

- Charging system
- 24-volt jump(jumpstart of vehicle with battery in series)
- TCM

Name of code: Transmission Temp Sensor Shorted (20)

When Monitored: Always monitored with system active at each ignition cycle.

Set Condition: Temperature sensor input is below a threshold (.5V), failed temperature sensor, short to ground, TCM

Theory of Operation: The Solenoid Assembly in the transmission contains a sensor that monitors the oil temperature of the transmission. This sensor is wired in series with the P/N Switch. The transmission temperature sensors expected state is detected as OPEN when the transmission is in Park or Neutral. When in park or neutral, the temperature displayed will be engine temperature.

Transmission Effects: No Reaction, Engine temperature is substituted for transmission temperature. If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status

Possible causes:

- Temp Sensor wiring
- Solenoid internal
- TCM

Name of code: System Undervoltage (21)

When Monitored: Always monitored with system active at each ignition cycle.

Set Condition: Ignition voltage falls below 8.5 volts with engine rpm greater than 2000 RPM for 60 seconds.

Theory of Operation: The Transmission Controller monitors the ignition voltage that it is supplied. This DTC is set when the monitored voltage falls below a threshold. Undervoltage limp-in mode will be activated when the voltage reaches the threshold, but a DTC will not be saved unless the engine speed and transmission input speed is greater then 2000 RPM for 60 seconds. The system will recover if the ignition voltage rises above 9.0 volts.

Transmission Effects: The TCM will go into undervoltage limp-in. Diagnostic DTC detection for other DTC's is turned off. If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status

Possible causes:

- Charging system
- Fused Ignition wiring
- Low battery voltage
- TCM

Name of code: ABS RR Sensor Message (22)

When Monitored: Valid ABS CAN messages received at least once and the CAN Bus circuit, ABS CAN Message Missing, ABS CAN Message Incorrect DTCs are not active

Set Condition: ABS signal ″wheel speed rear right″ not valid or ABS has detected a sensor failure.

Theory of Operation: The W5J400 transmission does not have an output shaft speed sensor. The TCM uses the ABS Wheel Speed sensor information, it receives over the CAN bus, to calculate the output shaft speed. This calculation considers the Axle ratio and Transfer case position and gear ratio when in 4 Low.

Transmission Effects: MIL on if two or more wheel speed sensors are involved. The secondary system reaction is to use wheel speed rear left as backup value, if two wheel speeds are not valid Temporary Limp-in mode is activated and backup value for wheel speeds = 2000 rpm. If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status

Possible causes:

- ABS Wheel speed sensor
- ABS controller
- TCM

Name of code: ABS LR Sensor Message (23)

When Monitored: Valid ABS CAN messages received at least once and the CAN Bus circuit, ABS CAN Message Missing, ABS CAN Message Incorrect are not active

Set Condition: ABS signal ″wheel speed rear left″ not valid or ABS has detected a sensor failure.

Theory of Operation: The W5J400 transmission does not have an output shaft speed sensor. The TCM uses the ABS Wheel Speed sensor information, it receives over the CAN bus, to calculate the output shaft speed. This calculation considers the Axle ratio and Transfer case position and ratio when in 4 Low.

Transmission Effects: MIL on if two or more wheel speed sensors are involved. The secondary system reaction is to use wheel speed rear right as backup value, if two wheel speeds are not valid Temporary Limp-in mode is activated and backup value for wheel speeds = 2000 rpm. If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status

Possible causes:

- ABS Wheel speed sensor
- ABS controller
- TCM

Name of code: ABS RF Sensor Message (24)

When Monitored: Valid ABS CAN messages received at least once and the CAN Bus circuit, ABS CAN Message Missing, ABS CAN Message Incorrect are not active

Set Condition: ABS signal ″Wheel Speed Front Right″ not valid or ABS has detected a sensor failure.

Theory of Operation: The W5J400 transmission does not have an output shaft speed sensor. The TCM uses the ABS Wheel Speed sensor information, it receives over the CAN bus, to calculate the output shaft speed. This calculation considers the Axle ratio and Transfer case position and ratio when in 4 Low. For some 4 Wheel Drive applications, it is required to average all four sensors to calculate an accurate output shaft speed. This is not required with this system, the front sensors are used for various other calculations (vehicle speed, transverse acceleration) etc.

Transmission Effects: no reaction- front sensors used for other calculations, MIL on if two or more wheel speed sensors are involved. The secondary system reaction is if two wheel speeds are not valid Temporary Limp-in mode is activated and backup value for wheel speeds = 2000 rpm. If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status

Possible causes:

- ABS Wheel speed sensor
- ABS controller
- TCM

Name of code: ABS LF Sensor Message (25)

When Monitored: Valid ABS CAN messages received at least once and the CAN Bus circuit, ABS CAN Message Missing, ABS CAN Message Incorrect are not active

Set Condition: ABS signal ″Wheel Speed Front Left″ not valid or ABS has detected a sensor failure.

Theory of Operation: The W5J400 transmission does not have an output shaft speed sensor. The TCM uses the ABS Wheel Speed sensor information, it receives over the CAN bus, to calculate the output shaft speed. This calculation considers the Axle ratio and Transfer case position and ratio when in 4 Low. For some 4 WD applications it is required to average all four sensor to calculate an accurate output shaft speed. This is not required with this system, front sensors are used for various other calculations (vehicle speed, transverse acceleration) etc.

Transmission Effects: No reaction- front sensors are used for other calculations, The MIL will be turned on if two or more wheel speed sensors are involved. The secondary system reaction is if two wheel speeds are not valid Temporary Limp-in mode is activated and backup value for wheel speeds = 2000 rpm. If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status

Possible causes:

- ABS Wheel speed sensor
- ABS controller
- TCM

Name of code: Engine APP/TPS Message (26)

When Monitored: - Valid APP/TPS CAN Message Received at least once and CAN Bus Circuit, Engine CAN Message Missing and Engine CAN Message Incorrect are not active.

Set Condition: - APP/TPS (accelerator pedal position) Message not valid or PCM/ECM engine sensor DTC detected. NOTE: The PCM/ECM can not detect a short to ground or an open circuit of the APP/TPS. The above DTC should only be indicated if the APP/TPS signal is shorted to Battery or Sensor supply.

Theory of Operation: The TCM does not have a direct interface with the APP/TPS (accelerator pedal position). It obtains this information over the CAN bus from the PCM/ECM.

Transmission Effects: No reaction - backup value for APP/TPS accelerator pedal position = 25 %. If the DTC is reset (after an ignition cycle), the DTC will be set to Stored (Intermittent) status

Possible causes:

- APP/TPS (accelerator pedal position)
- PCM/ECM
- TCM

Name of code: Engine Torque Message Incorrect (27)

When Monitored: Valid Torque CAN messages received at least once and CAN Bus Circuit, Engine CAN Message Missing and Engine CAN Message Incorrect are not active.

Set Condition: - Engine torque message not valid or PCM/ECM controller error.

Theory of Operation: The TCM receives engine torque information over the CAN bus from the PCM/ECM. This information is used to determine what torque reduction will be required during a transmission shift. The TCM requests the torque reduction from the PCM/ECM over the CAN bus. This message indicates the level of torque that the engine is presently producing.

Transmission Effects: No reaction - Shifts performed with higher system pressures and a backup value for engine torque = 600 Nm (443 Ft/LBS). If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status

Possible causes:

- PCM/ECM
- TCM

Name of code: Engine RPM Message (28)

When Monitored: - Valid RPM CAN message received at least once CAN Bus Circuit, Engine CAN Message Missing and Engine CAN Message Incorrect are not active.

Set Condition: Signal ″engine speed″ not valid or PCM/ECM error.

Theory of Operation: The TCM receives engine RPM information over the CAN bus from the PCM/ECM

Transmission Effects: No reaction - backup value for engine speed = 750 rpm. If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status

Possible causes:

- Engine Speed Sensor
- PCM/ECM
- TCM

Name of code: Engine Torque Message Incorrect (29)

When Monitored: - Valid Torque CAN messages received at least once and CAN Bus Circuit, Engine CAN Message Missing and Engine CAN Message Incorrect are not active.

Set Condition: - Engine torque minimum message not valid or PCM/ECM error.

Theory of Operation: The TCM receives engine torque information over the CAN bus from the PCM/ECM. This information is used to determine what torque reduction will be required during a transmission shift. The TCM requests the torque reduction from the PCM/ECM over the CAN bus. This message is used to set the minimum level of torque that the TCM can request

Transmission Effects: No reaction - Shifts performed with higher system pressures and a backup value for minimum engine torque = 600 Nm (443 Ft/LBS) If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status.

Possible causes:

- PCM/ECM
- TCM

Name of code: Engine Torque Message Incorrect (31)

When Monitored: - Valid Torque CAN messages received at least once and CAN Bus Circuit, Engine CAN Message Missing and Engine CAN Message Incorrect are not active.

Set Condition: - Engine torque Maximum message not valid or PCM/ECM error.

Theory of Operation: The TCM receives engine torque information over the CAN bus from the PCM/ECM. This information is used to determine what torque reduction will be required during a transmission shift. The TCM requests the torque reduction from the PCM/ECM over the CAN bus. This message is used to set the maximum level of torque that the TCM can request

Transmission Effects: No reaction - Shifts performed with higher system pressures and a backup value for engine torque = 600 Nm (443 Ft/LBS) If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status.

Possible causes:

- PCM/ECM
- TCM

Name of code: Engine Torque Message Incorrect (32)

When Monitored: - Valid Torque CAN messages received at least once and CAN Bus Circuit, Engine CAN Message Missing and Engine CAN Message Incorrect are not active.

Set Condition: Signal "torque demand ESP" not valid or PCM/ECM error.

Theory of Operation: The TCM receives engine torque information over the CAN bus from the PCM/ECM. This information is used to determine what torque reduction will be required during a transmission shift. The TCM requests the torque reduction from the PCM/ECM over the CAN bus. This message indicates what the present torque of the engine would be without a TCM torque reduction request.

Transmission Effects: No reaction - Shifts performed with higher system pressures and a backup value for engine torque = 600 Nm (443 Ft/LBS) If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status.

Possible causes:

- PCM/ECM
- TCM

Name of code: ABS Brake Message (33)

When Monitored: Valid Brake CAN message received at least once and CAN Bus Circuit, ABS CAN Message Missing, ABS CAN Message Incorrect are not active.

Set Condition: Signal "brake-light switch" not valid- ABS sending invalid value.

Theory of Operation: The TCM receives the brake switch status from the ABS controller over the CAN bus.

Transmission Effects: No reaction - brake light switch signal is set to a default value (not actuated). If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status.

Possible causes:

- ABS
- TCM

Name of code: Engine CAN Message missing (35)

When Monitored: CAN Bus circuit error not present, 1 second after ignition on and not in Park or Neutral, no System Overvoltage or System Undervoltage conditions present, or transmission in Park or Neutral and engine RPM greater than 850 RPM.

Set Condition: This DTC is set if the Vehicle Mileage CAN message from the PCM/ECM was not received in the required time.

Theory of Operation: The TCM receives information from the Engine controller over the CAN bus.

Transmission Effects: No reaction, no Mileage reported in DTC History, if the DTC is reset (after an ignition cycle), the DTC will be set to Stored (Intermittent) status.

Possible causes:

- CAN Bus wiring
- Ignition to PCM/ECM
- PCM/ECM
- TCM

Name of code: Engine CAN Message Missing (36)

When Monitored: CAN Bus Circuit error not present, 1 sec after ignition on and the transmission is not in Park or Neutral, no System Overvoltage or System Undervoltage conditions present, transmission in Park or Neutral and engine RPM greater than 850 RPM

Set Condition: : This DTC is set if the Engine Coolant and T-Case Status CAN message from the PCM/ECM was not received in the required time. - PCM/ECM controller issue

Theory of Operation: The TCM receives information from the PCM/ECM over the CAN bus.

Transmission Effects: The transmission will be placed in Temporary Limp-in, a backup value for engine coolant temperature = 80 °C (176 °F) - transfer case 4H default value used. If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status.

Possible causes:

- CAN Bus
- Ignition to PCM/ECM
- PCM/ECM
- TCM

Name of code: CAN Bus Circuit (37)

When Monitored: Always monitored with system active at each ignition cycle.

Set Condition: Open circuit in the CAN C Bus (+) circuit or CAN C Bus (-) circuit, Short to ground of CAN C Bus (+) circuit or CAN C Bus (-) circuit, Short to Voltage of CAN C Bus (+) circuit or CAN C

Bus (-) circuit, CAN C Bus (+) circuit shorted to CAN C Bus (-) circuit, or a TCM Failure

Theory of Operation: The TCM receives information from the PCM/ECM and ABS controllers over the CAN bus. The CAN bus is a high speed communication bus that allows real time control capability between various controllers. Most messages are sent every 20 milliseconds, this means critical information can be shared between controllers. The CAN bus is a two wire bus with a CAN C Bus (+) circuit and a CAN C Bus (-) circuit. These circuits are twisted pairs in the harness to reduce the potential of radio and noise interference.

Transmission Effects: The transmission will be placed in Temporary Limp-in. All Secondary System Reactions for Missing messages will be activated. If the DTC is reset (after an ignition cycle), the DTC will be set to Stored (Intermittent) status.

Possible causes:

- CAN Bus wiring
- ABS
- PCM/ECM
- TCM

Name of code: ABS CAN Message missing (38)

When Monitored: CAN Bus Circuit error not present, 1 second after ignition on and not in Park or Neutral, no System Overvoltage or System Undervoltage conditions present, or transmission in Park or Neutral and engine RPM greater than 850 RPM

Set Condition: This DTC is set when a CAN ID was not received in the required time and are not being sent from the ABS Controller. NOTE: The ABS controller is powered by the run only ignition feed. This means that this DTC will be set if the key is placed in the start position with the transmission in gear or if in Park or Neutral and the engine RPM is greater than 850 RPM. Because of this, the presence of this DTC should be verified by turning the ignition on to the run position and placing the Shifter in the R position.

Theory of Operation: The TCM receives information from the ABS controller over the CAN bus.

Transmission Effects: The transmission will be placed in Temporary Limp-in. Backup values for wheel speed set to 2000 RPM. If the DTC is reset (after an ignition cycle), the DTC will be set to Stored (Intermittent) status.

Possible causes:

- CAN Bus wiring
- Ignition to PCM/ECM
- ABS
- TCM

Name of code: Engine CAN Message missing (39)

When Monitored: CAN Bus Circuit error not present, 1 second after ignition on and not in Park or Neutral, no System Overvoltage or System Undervoltage conditions present, or transmission in Park or Neutral and engine RPM greater than 850 RPM

Set Condition: This DTC is set when the Engine Torque, APP/TPS and RPM CAN messages from the PCM/.ECM was not received in the required time.

Theory of Operation: The TCM receives information from the Engine controller over the CAN bus.

Transmission Effects: Controlled Limp-in, backup value for accelerator pedal position is 25%, backup value for engine rpm is 750 rpm, TCM uses backup value for engine torque of 600 Nm, and other PCM/ECM signals are set to default. If the DTC is reset (after an ignition cycle), the DTC will be set to Stored (Intermittent) status.

Possible causes:

- CAN Bus wiring
- Ignition to PCM/ECM
- PCM/ECM
- TCM

Name of code: Engine Temp Message (43)

When Monitored: Valid Engine Temp CAN message received at least once and CAN Bus Circuit error, Engine CAN Message Missing and Engine CAN Messages Incorrect are not active.

Set Condition: Engine coolant temperature signal is not valid - indicates a possible coolant temperature sensor error.

Theory of Operation: The TCM receives engine temperature information over the CAN bus from the Diesel Controller. This information is used to modify transmission shifting based on engine temperature. It is also used as a backup if the transmission temperature sensor fails.

Transmission Effects: No reaction - backup value for engine coolant temperature = 80 °C

Possible causes:

- Engine Temperature Sensor Wiring
- Engine Temperature Sensor
- PCM/ECM
- TCM

Name of code: Engine T-case Switch Message (44)

When Monitored: Valid T-Case CAN message received at least once, the CAN Buss Circuit and Engine CAN Message Missing are not active.

Set Condition: Transfer Case Status signal not valid - indicates possible T-Case sensor error.

Theory of Operation: The W5J400 Transmission does not have an output speed sensor. The output shaft speed is calculated from the ABS wheel speed information received over the CAN bus. In order to calculate the output shaft speed the TCM uses the axle ratio and the transfer case ratio when in low gear. The TCM must know what mode the T-Case is in at all times. This is accomplished by a sensor in the transfer case that is wired to the PCM/ECM.

Transmission Effects: The MIL will illuminate and the transmission will be placed in Permanent Limp-in. If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status

Possible causes:

- Transfer Case Sensor wiring
- Transfer Case Sensor
- Transfer Case - Mechanical
- PCM/ECM
- TCM

Name of code: Engine Overspeed (49)

When Monitored: Valid Engine RPM message received at least once, the CAN Bus Circuit and Engine CAN Message Missing are not active.

Set Condition: If the engine speed increases above 5100 RPM.

Theory of Operation: The TCM monitors the engine speed over the CAN bus. If the engine speed increases above a set value (5100 RPM) the TCM assumes that either the information from the Engine controller is incorrect or that a major mechanical problem exists. The TCM will then force the transmission into neutral to protect the transmission.

Transmission Effects: The MIL will illuminate and the transmission will be placed in Neutral (LOSS of DRIVE) until the ignition key is cycled. If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status.

Possible causes:

- Engine - Mechanical
- Transmission - Mechanical
- PCM/ECM
- TCM

Name of code: Improper Ratio (50)

When Monitored: Engine rpm greater than 450 rpm, output speed greater than 180 rpm, no N2 - N3 input speed sensor errors present, no gear selector lever errors present, no ABS system errors, no transfer case errors present, and all wheel speeds above 450 rpm.

Set Condition: No shifting operation and detected gear is not the actual gear No shifting operation - detected (calculated) gear is less than actual(expected) gear or no plausible gear is calculated or Actual turbine speed - calculated turbine speed > 300 rpm or calculated transmission ration is above threshold. During an Upshift - detected (calculated) gear is less than actual(expected) gear-1. During Downshift - detected (calculated) gear is less than actual (expected) gear

Theory of Operation: The TCM constantly calculates the transmission ratio based on the N2-N3 input speed signals and the calculated output shaft speed (CAN message from the ABS). The TCM will detect if the transmission is trying to mechanically shift into a lower gear, then the TCM intends.

Transmission Effects: The MIL will illuminate and the transmission will be placed in Neutral (LOSS of DRIVE) until the ignition key is cycled. If the DTC is reset (after an ignition cycle) the DTC will be set to Stored (Intermittent) status.

Possible causes:

- Solenoid wiring
- Transfer Case position sensor
- Transmission - mechanical
- TCM

Name of code: Transmission Slipping (51)

When Monitored: Engine rpm greater than 450 rpm, output speed greater than 180 rpm, no N2 - N3 input speed sensor errors present, no gear selector lever errors present, no ABS system errors, no transfer case errors present, and all wheel speeds between 70 - 380 rpm with no wheel slip detected.

Set Condition: Calculated ratio not within allowable range for the engaged gear. No shifting operation.

Theory of Operation: The TCM constantly calculates the transmission ratio based on the N2-N3 input speed signals and the calculated output shaft speed (CAN message from the ABS). The TCM will detect if the transmission is slipping or an invalid gear ratio is present

Transmission Effects: Controlled Limp-in and delayed engagement in reverse, modulating pressure is set to maximum value and a transmission shift into 3rd gear only, will be allowed, MIL will illuminate, DTC re-evaluated after ignition key is cycled. If the DTC is reset (after an ignition cycle), the DTC will be set to Stored (Intermittent) status.

Possible causes:

- Transfer Case position error
- Transfer case - mechanical
- Transfer Case - shift cable adjustment
- Transmission - mechanical
- Axle - mechanical
- Axle ratio incorrect
- TCM

Name of code: TCC Stuck On (52)

When Monitored: TCM not in initialization phase, No input speed sensor N2 - N3 codes present, no CAN bus code present, no PCM/ECM codes present, no CAN engine speed codes present, Engine speed Greater than 450 rpm, no CAN engine torque codes present, no shift in progress, must be in a forward gear (1, 2, 3, 4 or 5 engaged), TCM torque converter status = OPEN

Set Condition: Engine RPM-Turbine Speed 100NM for 1 second

Theory of Operation: The TCM constantly monitors the amount of torque converter slippage. When the torque converter is open the slippage is expected to be above a threshold. If the slippage is less then expected when the TCC is open then the TCM assumes that the TCC is stuck on.
Transmission Effects: No reaction, If the DTC is reset (after an ignition cycle), the DTC will be set to Stored (Intermittent) status.
Possible causes:

- Solenoid
- Transmission - mechanical
- TCM

Name of code: TCC Over Temp (53)
When Monitored: TCM not in initialization phase, Solenoid supply active, No input speed sensor N2 - N3 codes present, no CAN bus code present, no PCM/ECM codes present, no CAN engine speed codes present, TCM torque converter clutch in slip mode.
Set Condition: Friction loss factor reaches threshold
Theory of Operation: The TCM monitors the friction losses of the torque converter clutch while it is in slipping mode. The friction losses are calculated using the CAN signals engine speed and engine torque as well as the torque converters turbine speed calculated by the TCM. Depending on the friction losses calculated in each program cycle, a corresponding value is added to a factor as long as the torque converter clutch is in slipping mode. The factor is set to 0 when the clutch is opened. If the factor reaches a specified value a DTC is detected.
Transmission Effects: No reaction, the desired value for the TCC slip is set to it's minimum value until the DTC is cleared by the DRBIII®. DTC's must be erased in order to return to normal operation.
Possible causes:

- Transmission - mechanical

Name of code: Engine Torque Reduction (54)
When Monitored: Engine intervention active for at least 20 ms, no engine torque errors, engine torque demand is greater than 0.
Set Condition: Torque Reduction acknowledge bit - not set, no shift aborts, the error flag ″torque reduction acknowledge″ is not set, Engine controller not supporting torque requests.
Theory of Operation: The TCM requests torque reductions, over the CAN bus, during a transmission shift to improve shift quality. The TCM verifies that the PCM/ECM has performed the requested torque reduction by monitoring the response to the request. If the response is not within a specified tolerance the TCM increments a counter. If this counter reaches a threshold then a failure is detected
Transmission Effects: No reaction, If the DTC is reset (after an ignition cycle), the DTC will be set to Stored (Intermittent) status.
Possible causes:

- PCM/ECM
- TCM

Name of code: Improper Gear (55)
When Monitored: The conditions for gear detection: are, engine speed greater than 450 rpm, No input speed sensor failures are active, no selector lever error active, selector lever is not in intermediate position, selector lever position is not showing power-up value, no output speed error is active, no transfer case error is active, output speed (ABS system) greater than 180 rpm, no wheel speed (ABS system) overspeed detected.
Set Condition: If problem is present for the 3 consecutive ignition cycles then the system will be placed into Limp-in mode until the DTC is cleared by the DRBIII® diagnostic tool.
Theory of Operation: The TCM compares the calculated gear with the gear the transmission has actually engaged. The actual gear is identified by verifying the signals of the two speed sensors N2 and N3 as well as the transmission output speed (from the ABS system). If the actual gear differs from the gear calculated by the TCM, the TCM value is adjusted to the engaged gear and a counter is increased by 2 points. If after a shift the engaged gear and the calculated gear still match, the counter is decreased by 1 point. A DTC is detected as soon as the counter exceeds a threshold.
Transmission Effects: The MIL will illuminate and the transmission will be placed in Temporary Limp-in until the ignition key is cycled. If three consecutive failures are detected by the TCM, the TCM will place the transmission is Limp-in until the DTC is erased with the DRBIII®. If the DTC is reset (after an ignition cycle), the DTC will be set to Stored (Intermittent) status.
Possible causes:

- Solenoid valve
- Internal Transmission
- TCM

Name of code: Solenoid Supply/Watchdog (56)
When Monitored: Always monitored with system active at each ignition cycle.
Set Condition: During the power up of the TCM, it tests the ability of the external watchdog to shut down the Solenoid Supply driver.
Theory of Operation: The TCM performs various internal tests to verify proper TCM operation. During the power up of the TCM it tests the ability of the external watchdog to shut down the Solenoid Supply driver. It does this by not servicing the external watchdog, this will cause a false triggering of the Watchdog and should result in the shut down

of the Solenoid Supply Driver. The controller monitors the A/D feedback on the Solenoid Supply driver output to ensure that 12 V is no longer present there. Note: You must eliminate a short to B+ on solenoids and/or wiring before replacing the TCM, a short to Battery on the solenoid supply output or one of the other solenoids will result in HI on the Solenoid Supply output and may set this DTC in error.

Transmission Effects: Hardware Error Mode - When the TCM detects a major internal error the transmission will be placed in the permanent limp-in mode and cease all communication over the CAN bus. Once the TCM has entered this mode normal transmission operation will not resume until all DTC's are cleared from the TCM. This DTC will not reset with ignition off. The DTC must be cleared with the DRBIII® diagnostic tool in order to return to normal operation

Possible causes:

- Short to Battery on Solenoid Supply line or one of the Solenoids
- TCM

Name of code: Transmission Temperature Sensor - P/N switch circuit (74)

When Monitored: Always monitored with system active at each ignition cycle.

Set Condition: Temp sensor is open while in forward gears (1-5), temp sensor, open trans temp circuit, P/N Switch.

Theory of Operation: The Solenoid Assembly of the W5J400 transmission contains a temperature sensor to monitor the transmission oil temperature. This sensor is wired in series with the transmission Park/Neutral switch. The TCM expects to see a valid voltage level from the sensor when the shifter is in any forward gear position, and it expects to see an open circuit condition when the shifter is in the Park or Neutral position. When the TCM detects and open circuit when in a forward gear position the DTC is set.

Transmission Effects: No reaction, there will be a 500mSec delay in the starting of the engine and engine temperature is used for transmission temperature. Error is set to intermittent only after the DTC condition is removed. Error will remain active after reset by default until it has been verified that the error is no longer present.

Possible causes:

- Temp Sensor wiring
- Shifter Adjustment
- Solenoid
- Internal Shifter
- TCM

Name of code: Trans Temp Sensor Erratic (75)

When Monitored: When transmission temperature is below 170° C (338° F)

Set Condition: When there is a 10° C (18° F) variation between each transmission temperature sensor read. If the DTC is reset (after an ignition cycle), the DTC will be set to Stored (Intermittent) status.

Theory of Operation: The Solenoid Assembly of the W5J400 transmission contains a temperature sensor to monitor the transmission oil temperature. This sensor is wired in series with the transmission Park/Neutral switch. The TCM expects to see a valid voltage level from the sensor when the shifter is in any forward gear position, and it expects to see an open circuit condition when the shifter is in the Park or Neutral position. The TCM will set this DTC when it detects that the Temperature sensor input is changing to fast to be realistic

Transmission Effects: No reaction, If three consecutive failures are detected by the TCM the DTC will be set, the DTC will reset when there is less than a 2° C (36° F) variation between sensor reads for 5 seconds. Error is set to intermittent after a reset occurs. If the DTC is reset (after an ignition cycle), the DTC will be set to Stored (Intermittent) status. Error is set to intermittent only after the DTC condition is removed. Error will remain active after reset by default until it has been verified that the error is no longer present.

Possible causes:

- Temp Sensor wiring (intermittent)
- Solenoid
- TCM

Name of code: Internal Shifter failure (76)

When Monitored: Always monitored with system active at each ignition cycle.

Set Condition: Shifter sends an erroneous signal indicating the shifter detected an Internal shifter problem, shifter held in an intermediate position for more than 30 seconds.

Theory of Operation: The W5J400 transmission does not have a Range Sensor internally. The customer requested gear must be communicated by the shifter module to the TCM. This is accomplished by five circuits, which sends a gray code to the TCM. The Shifter module performs it's own internal checks for proper operation. When the Shifter detects an internal failure it sends a DTC to the TCM. Clear DTC if DTC returns replace shifter

Transmission Effects: The MIL will illuminate and the transmission will be placed in Temporary Limp-in until the ignition key is cycled. If the DTC is reset, the DTC will be set to Stored (Intermittent) status.

Possible causes:

- Shifter held in intermediate position for more then 30 seconds
- Shifter out of adjustment
- Shifter Module - internal

Name of code: ABS CAN Messages Incorrect (81)
When Monitored: ABS messages received at least once and CAN Bus Circuit (37) is not active
Set Condition: DTC Detected if the number of bytes incorrect for CAN ID.
Theory of Operation: The messages sent on the CAN bus are distinguished by an ID. Each CAN ID is defined to contain a certain number of bytes. The TCM verifies that it has received the proper number of bytes for each ID.
Transmission Effects: The MIL will illuminate and the transmission will be placed in Temporary Limp-in until the ignition key is cycled. If the DTC is reset (after an ignition cycle), the DTC will be set to Stored (Intermittent) status. The TCM will use a default wheel speed of 2000 RPM.
Possible causes:

- ABS
- TCM

Name of code: Engine CAN Messages Incorrect (82)
When Monitored: CAN-ID received at least once and CAN Bus Circuit (37) is not active
Set Condition: DTC Detected if the number of bytes incorrect for CAN ID.
Theory of Operation: The messages sent on the CAN Bus are distinguished by an ID. Each CAN ID is defined to contain a certain number of bytes. The TCM verifies that it has received the proper number of bytes for each ID.
Transmission Effects: No reaction, system recovery if the correct message sent, backup value for accelerator pedal position = 25 %, backup value for engine speed = 750 rpm, TCM uses a backup value for engine torque = 600 Nm (443 ft lbs), default values for engine signals. If the DTC is reset (after an ignition cycle), the DTC will be set to Stored (Intermittent) status.
Possible causes:

- PCM/ECM
- TCM

Name of code: Engine CAN Messages Incorrect (83)
When Monitored: CAN-ID received at least once and CAN Bus Circuit (37) is not active
Set Condition: DTC Detected if the number of bytes incorrect for CAN ID.
Theory of Operation: The messages sent on the CAN bus are distinguished by an ID. Each CAN ID is defined to contain a certain number of bytes. The TCM verifies that it has received the proper number of bytes for each ID.
Transmission Effects: The MIL will illuminate and the transmission will be placed in Temporary Limp-in until the ignition key is cycled. If the DTC is reset (after an ignition cycle), the DTC will be set to Stored (Intermittent) status. The system will recover if the correct message sent. The TCM will use backup value for engine coolant temperature = 80° C (176° F), default values used for transfer case signals.
Possible causes:

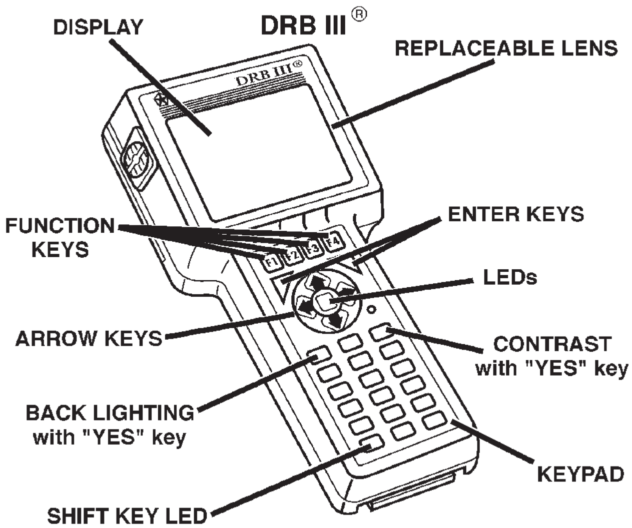
- PCM/ECM
- TCM

Name of code: Engine CAN Messages Incorrect (85)
When Monitored: CAN-ID received at least once and CAN Bus Circuit (37) is not active
Set Condition: DTC Detected if the number of bytes incorrect for CAN ID.
Theory of Operation: The messages sent on the CAN bus are distinguished by an ID. Each CAN ID is defined to contain a certain number of bytes. The TCM verifies that it has received the proper number of bytes for each ID.
Transmission Effects: No effect on the transmission system operation. No mileage information will be stored in Freeze Frame for transmission. The DTC is reset (after an ignition cycle), the DTC will be set to Stored (Intermittent) status. The system will recover if the correct message received from the engine controller.
Possible causes:

- PCM/ECM
- TCM

3.4 USING THE DRBIII®

Refer to the DRBIII® user's guide for instructions and assistance with reading trouble codes, erasing trouble codes, and other DRBIII® functions.



80b57566

3.5 DRBIII® ERROR MESSAGES

Under normal operation, the DRBIII® will display one of only two error messages:

- User-Requested WARM Boot
- User-Requested COLD Boot

If the DRBIII® should display any other error message, record the entire display and call the S.T.A.R. Center.

3.5.1 DRBIII® DOES NOT POWER UP (BLANK SCREEN)

If the LED's do not light or no sound is emitted at start up, check for loose cable connections or a bad cable. Check the vehicle battery voltage. A minimum of 11 volts is required to adequately power the DRBIII®.

If all connections are proper between the DRBIII® and the vehicle or other devices, and the vehicle battery is fully charged, an inoperative DRBIII® may be the result of faulty cable or vehicle wiring. For a blank screen, refer to the appropriate Body Diagnostic manual.

3.5.2 DISPLAY IS NOT VISIBLE

Low temperatures will affect the visibility of the display. Adjust the contrast to compensate for this condition.

4.0 DISCLAIMERS, SAFETY, AND WARNINGS

4.1 DISCLAIMERS

All information, illustrations, and specifications contained in this manual are based on the latest information available at the time of publication. The right is reserved to make changes at any time without notice.

4.2 SAFETY

4.2.1 TECHNICIAN SAFETY INFORMATION

WARNING: ENGINES PRODUCE CARBON MONOXIDE THAT IS ODORLESS, CAUSES SLOWER REACTION TIME, AND CAN LEAD TO SERIOUS INJURY. WHEN THE ENGINE IS OPERATING KEEP SERVICE AREAS WELL VENTILATED OR ATTACH THE VEHICLE EXHAUST SYSTEM TO THE SHOP EXHAUST REMOVAL SYSTEM.

Set the parking brake and block the wheels before testing or repairing the vehicle. If is especially important to block the wheels on front-wheel drive vehicles: the parking brake does not hold the drive wheels.

Some operations in this manual require that hydraulic tubes, hoses, and fittings, disconnected for inspection or testing purposes. These systems, when fully charged, contain fluid at high pressure.

Before disconnecting any hydraulic tubes, hoses, and fittings, be sure that the system is fully depressurized.

When servicing a vehicle, always wear eye protection, and remove any metal jewelry such as watchbands or bracelets that might make an inadvertent electrical contact.

When diagnosing a Transmission system problem, it is important to follow approved procedures where applicable. These procedures can be found in the service information. Following these procedures is very important to the safety of individuals performing diagnostic tests.

4.2.2 VEHICLE PREPARATION FOR TESTING

Make sure the vehicle being tested has a fully charged battery. If it does not, false diagnostic DTC's or error messages may occur. It is extremely important that accurate shift lever position data is available to the TCM. The accuracy of any DTC found in memory is doubtful unless the Shift Lever Test, performed on the DRBIII® Scan Tool, passes without failure.

4.2.3 SERVICING SUB-ASSEMBLIES

Some components of the Transmission system are intended to be serviced in assembly only. Attempting to remove or repair certain system sub-components may result in personal injury and/or improper system operation. Only those components with approved repair and installation procedures in the service information should be serviced.

4.2.4 DRBIII® SAFETY INFORMATION

WARNING: EXCEEDING THE LIMITS OF THE DRBIII® MULTIMETER IS DANGEROUS. IT CAN EXPOSE YOU TO SERIOUS OR POSSIBLY FATAL INJURY. CAREFULLY READ AND UNDERSTAND THE CAUTIONS AND THE SPECIFICATION LIMITS.

- Follow the vehicle manufacturer's service specifications at all times.
- Do not use the DRBIII® if it has been damaged.
- Do not use the test leads if the insulation is damaged or if metal is exposed.
- To avoid electrical shock, do not touch the test leads, tips or the circuit being tested.
- Choose the proper range and function for the measurement. Do not try voltage or current measurements that may exceed the rated capacity.
- Do not exceed the limits shown in the table.

FUNCTION	INPUT LIMIT	Volts
0-500 volts peak AC	0-500 volts DC	Ohms (resistance)*
0-1.12 megohms	Frequency measured Frequency generated	0-10 khz
Temperature	-58-1100°F	-50-600°C
*Ohms cannot be measured if voltage is present. Ohms can be measured only in a non-powered circuit.		

- Voltage between any terminal and ground must not exceed 500v DC or 500v peak AC.
- Use caution when measured voltage above 25v DC or 25v AC.
- The circuit being tested must be protected by a 10A fuse or circuit breaker.
- Use the low current shunt to measure circuits up to 10A. Use the high current clamp to measure circuits exceeding 10A.
- When testing for the presence of voltage or current, make sure the meter is functioning correctly. Take a reading of a known voltage or current before accepting a zero reading.
- When measuring current, connect the meter in series with the load.
- Disconnect the live test lead before disconnecting the common test lead.
- When using the meter function, keep the DRBIII® away from spark plug or coil wires to avoid measuring error from outside interference.

4.3 WARNINGS

4.3.1 VEHICLE DAMAGE WARNINGS

Before disconnecting any control module, make sure the ignition is "lock" position. Failure to do so could damage the module.

When testing voltage or continuity at any control module, use the terminal side (not the wire end) of the connector. Do not probe a wire through the insulation: this will damage the wire and eventually cause the wire to fail because of corrosion.

Be careful when performing electrical tests so as to prevent accidental shorting of terminals. Such mistakes can damage fuses or components. Also, a second DTC could be set, making diagnosis of the original problem more difficult.

When replacing a blown fuse, it is important to use only a fuse having the correct amperage rating. The use of a fuse with a rating other than indicated may result in a dangerous electrical system overload. If a properly rated fuse continues to blow, it indicates a problem in the circuit that must be corrected.

4.3.2 ROAD TESTING A COMPLAINT VEHICLE

Some complaints will require a test drive as part of the repair verification procedure. The purpose of the test drive is to try to duplicate the diagnostic DTC or symptom condition.

CAUTION: Before road testing a vehicle, be sure that all components are reassembled. During the test drive, do not try to read DRBIII® screen while in motion. Do not hang the DRBIII® from the rear view mirror or operate it yourself. Have an assistant available to operate the DRBIII®.

Road testing is an essential step in the diagnostic process that must not be overlooked. Along with the diagnostic information obtained from the DRBIII® Scan Tool and the original customer concern, the road test helps verify the problem was current and any repairs performed, fixed the vehicle correctly. Always operate and observe the vehicle under actual driving conditions.

Just as important as the road test is, there are preliminary inspections that should be performed prior to the road test. Always check the fluid level and condition before taking the vehicle on a road test. Determine if the incorrect fluid is being used, improper fluid will result in erratic transmission operation.

Some of the conditions of incorrect fluid level are as follows:

- Delayed engagement
- Poor shifting or erratic shifting
- Excessive noise
- Overheating

The next step is to verify that the shift linkage is correctly adjusted. If the shift linkage is incorrectly adjusted, a number of complaints can result.

The TCM monitors the Shift Lever Position (SLP) continuously. If the linkage is incorrectly adjusted, the TCM will sense a shift lever position that is not correct for the gear chosen by the driver. This may cause a DTC to be set.

The following complaints may also be the result of an incorrectly adjusted or worn linkage:

- Delayed clutch engagement
- Erratic shifts
- Vehicle will drive in neutral
- Engine will not crank in park or neutral
- Gear shift linkage will be able to be shifted without the key in the ignition
- Not able to remove the ignition key in park
- Parking pawl will not engage properly

The shift linkage should also be adjusted when replacing the Transmission, repairing the valve body, or when repairing any component between the shift lever and the Transmission.

Some questions to ask yourself when performing the road test are as follows:

- Is the complaint or concern what you think the problem is, based on the drivers description of the problem?
- Is the Transmission operating normally, or is there a real problem?
- When does the problem occur?
- Is the problem only in one gear range?
- What temperature does the problem occur?
- Does the vehicle have to sit over night for the problem to occur?
- Does the transmission go into Limp-in mode?

4.4 BULLETINS AND RECALLS

ALWAYS PERFORM ALL SAFETY RECALLS AND TECHNICAL SERVICE BULLETINS THAT ARE APPLICABLE TO THE PROBLEM.

5.0 REQUIRED TOOLS AND EQUIPMENT

- DRBIII® (diagnostic read-out box) - DRBIII® must use the latest release level.
- Jumper wires
- Test Light
- Ohmmeter
- Voltmeter

6.0 GLOSSARY OF TERMS

6.1 ACRONYMS

ABS	Antilock Braking system
A/C	Air conditioner
A/D	Analog to Digital conversion
APP	Accelerator Pedal Position
CAN	Controller Area Network (Inter-module Bus)
CKT	Circuit
DLC	Data Link Connector
DRBIII®	Diagnostic Readout Box
DTC	Diagnostic Trouble Code
EATX	Electronic Automatic Transmission
ECM	Diesel Engine Controller
EMCC	Electronically Modulated Converter Clutch
IOD	Ignition off-draw
ISS	Input Speed Sensor (N2 and N3)
LED	Light Emitting Diode
MIL	Malfunction Indicator Lamp
OSS	Output Speed Sensor (derived form the ABS controller)
PCI	Programmable Controller Interface (Vehicle bus system)
PCM/ECM	Powertrain or Engine Control Module
PEMCC	Partial Electronically Modulated Converter Clutch
PWM	Pulse width modulated
SW	Switch
TCC	Torque Converter Clutch
TCM	Transmission Control Module
TP	Throttle Position
TRD	Torque Reduction
TTS	Transmission Temperature Sensor
1-2/4-5 solenoid	controls the shift into and out of 2nd gear or 5th gear.
2-3 solenoid	controls the shift into and out of 3rd gear
3-4 solenoid	controls the shift into and out of 4th gear
TCC solenoid	is pulse width modulated and controls the TCC clutch
Shift Pressure Solenoid	is a pulse width modulated solenoid and controls the hydraulic pressure to the shift elements.
Modulation pressure solenoid	is a pulse width modulated solenoid and controls the hydraulic system pressure

6.2 DEFINITIONS

Driving cycle counter - The starts since first set counter indicates the number of driving cycles since the first occurrence of an error.

NOTES

7.0

DIAGNOSTIC INFORMATION AND PROCEDURES

Symptom:
*NO RESPONSE FROM SHIFTER ASSEMBLY - DIESEL ONLY

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH THE BCM
OPEN GROUND CIRCUIT
OPEN FUSED IGNITION SWITCH OUTPUT CIRCUIT
OPEN PCI BUS CIRCUIT
SHIFTER ASSEMBLY

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, enter Body then Body Computer. Was the DRB able to I/D or communicate with the BCM? Yes → Go To 2 No → Refer to the symptom list for problems related to no communication with the BCM. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Disconnect the Shifter Assembly C1 harness connector. Using a 12-volt test light connected to 12-volts, probe each ground circuit. Is the test light illuminated for each circuit? Yes → Go To 3 No → Repair the ground circuit for an open. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Disconnect the Shifter Assembly C1 and C2 harness connectors. Turn the ignition on. Using a 12-volt test light connected to ground, probe each Fused Ignition Switch Output circuit. Is the test light illuminated for each circuit? Yes → Go To 4 No → Repair the Fused Ignition Switch Output circuit for an open or short. Refer to the wiring diagrams in the service information. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

*NO RESPONSE FROM SHIFTER ASSEMBLY - DIESEL ONLY — Continued

TEST	ACTION	APPLICABILITY
4	**Note: Ensure there is PCI Bus communication with other modules on the vehicle before proceeding. If not, refer to the symptom list from the menu and repair as necessary.** Disconnect the Shifter Assembly C1 harness connector. Use Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes. Connect the scope input cable to the channel one connector on the DRB. Attach the red and black leads and the cable to probe adapter to the scope input cable. With the DRBIII® select Pep Module Tools. Select lab scope. Select Live Data. Select 12 volt square wave. Press F2 for Scope. Press F2 and use the down arrow to set voltage range to 20 volts. Set Probe to x10. Press F2 again when complete. Connect the Black lead to the chassis ground. Connect the Red lead to the PCI Bus circuit in the Shifter Assembly connector. Turn the ignition on. Observe the voltage display on the DRB Lab Scope. Does the voltage pulse from 0 to approximately 7.5 volts? Yes → Replace the Shifter Assembly in accordance with the service information. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Repair the PCI Bus circuit for an open. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:

*NO RESPONSE FROM TRANSMISSION CONTROL MODULE - DIESEL ONLY

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH THE ECM
FUSED IGNITION SWITCH OUTPUT (RUN/ST) CIRCUIT OPEN
GROUND CIRCUIT OPEN
SCI TRANSMIT CIRCUIT OPEN
TRANSMISSION CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, attempt to communicate with the ECM. Was the DRB able to I/D or communicate with the ECM? Yes → Go To 2 No → Refer to the symptom list for problems related to no communication with the ECM (SCI Only). Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
2	Turn the ignition off to the lock position. Disconnect the TCM C1 harness connector. Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Fused Ignition Switch Output (Run/St) circuit. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 3 No → Repair the Fused Ignition Switch Output (Run/St) circuit for an open. Refer to the wiring diagrams in the Service Information. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
3	Turn the ignition off to the lock position. Disconnect the TCM C1 harness connector. Using a 12-volt test light connected to 12-volts, check the ground circuit in the TCM harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.** Does the test light illuminate brightly? Yes → Go To 4 No → Repair the Ground circuit for an open. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

*NO RESPONSE FROM TRANSMISSION CONTROL MODULE - DIESEL ONLY — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the TCM C1 harness connector. Disconnect the DRB from the DLC. Measure the resistance of the SCI Transmit circuit between the TCM connector and the DLC. Is the resistance below 5.0 ohms? Yes → Replace the Transmission Control Module in accordance with the service information. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Repair the SCI Transmit circuit for an open. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
1-2/4-5 SOLENOID CIRCUIT (2, 71)

When Monitored and Set Condition:

1-2/4-5 SOLENOID CIRCUIT (2, 71)

When Monitored: Always monitored with system active at each ignition cycle.

Set Condition: If the TCM detects a short to ground or battery on the solenoid control circuit, shorted solenoid, open solenoid, or an open or shorted solenoid control circuit driver in the TCM.

POSSIBLE CAUSES
INTERMITTENT WIRING AND CONNECTORS
1-2/4-5 SOLENOID CONTROL CIRCUIT OPEN
1-2/4-5 SOLENOID CONTROL CIRCUIT SHORT TO GROUND
1-2/4-5 SOLENOID CONTROL CIRCUIT SHORT TO OTHER CIRCUITS
1-2/4-5 SOLENOID
TCM - 1-2/4-5 SOLENOID CIRCUIT

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

1-2/4-5 SOLENOID CIRCUIT (2, 71) — Continued

TEST	ACTION	APPLICABILITY
2	Ignition on, engine not running. With the DRBIII®, erase DTCs. With the DRBIII®, perform the Solenoid Test. With the DRBIII®, read DTCs. Did the DTC, 1-2/4-5 SOLENOID CIRCUIT, reset? Yes → Go To 3 No → Go To 7	All
3	Turn the ignition off to the lock position. Disconnect the Transmission Control Module C2 harness connector. Disconnect the Transmission Solenoid Assembly harness connector **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the 1-2/4-5 Solenoid Control circuit from the TCM harness connector to the Transmission Solenoid Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the 1-2/4-5 Solenoid Control circuit for an open. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off to the lock position. Disconnect the Transmission Control Module C2 harness connector. Disconnect the Transmission Solenoid Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the 1-2/4-5 Solenoid Control circuit. Is the resistance below 5.0 ohms? Yes → Repair the 1-2/4-5 Solenoid Control circuit for a short to ground. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off to the lock position. Disconnect the Transmission Control Module C2 harness connector. Disconnect the Transmission Solenoid Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the 1-2/4-5 Solenoid Control circuit to all other circuits in the Transmission Solenoid Assembly harness connector. Is the resistance below 5.0 ohms between any other circuit? Yes → Repair the 1-2/4-5 Solenoid Control circuit for a short to other circuit-s. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 6	All

1-2/4-5 SOLENOID CIRCUIT (2, 71) — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off to the lock position. Disconnect the Transmission Control Module C2 harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between the 1-2/4-5 Solenoid Control circuit and the Solenoid Supply Voltage Circuit in the Transmission Control Module C2 harness connector. Is the resistance between 2.5 and 6.5 ohms? Yes → Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Replace the 1-2/4-5 Solenoid per the Service Information. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
7	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. **NOTE: Check the Technical Service Bulletins.** Were there any problems found? Yes → Repair as necessary Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
2-3 SOLENOID CIRCUIT (3, 72)

When Monitored and Set Condition:

2-3 SOLENOID CIRCUIT (3, 72)

When Monitored: Always monitored with system active at each ignition cycle.

Set Condition: If the TCM detects a short to ground or battery on the solenoid control circuit, shorted solenoid, open solenoid, or an open or shorted solenoid control circuit driver in the TCM.

POSSIBLE CAUSES
INTERMITTENT WIRING AND CONNECTORS
2-3 SOLENOID CONTROL CIRCUIT OPEN
2-3 SOLENOID CONTROL CIRCUIT SHORT TO GROUND
2-3 SOLENOID CONTROL CIRCUIT SHORT TO OTHER CIRCUITS
2-3 SOLENOID
TCM - 2-3 SOLENOID CIRCUIT

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

2-3 SOLENOID CIRCUIT (3, 72) — Continued

TEST	ACTION	APPLICABILITY
2	Ignition on, engine not running. With the DRBIII®, erase DTCs. With the DRBIII®, perform the Solenoid Test. With the DRBIII®, read DTCs. Did the DTC, 2-3 SOLENOID CIRCUIT, reset? Yes → Go To 3 No → Go To 7	All
3	Turn the ignition off to the lock position. Disconnect the Transmission Control Module C2 harness connector. Disconnect the Transmission Solenoid Assembly harness connector **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the 2-3 Solenoid Control circuit from the TCM C2 harness connector to the Transmission Solenoid Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the 2-3 Solenoid Control circuit for an open. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off to the lock position. Disconnect the Transmission Control Module C2 harness connector. Disconnect the Transmission Solenoid Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the 2-3 Solenoid Control circuit. Is the resistance below 5.0 ohms? Yes → Repair the 2-3 Solenoid Control circuit for a short to ground. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off to the lock position. Disconnect the Transmission Control Module C2 harness connector. Disconnect the Transmission Solenoid Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the 2-3 Solenoid Control circuit to all other circuits in the Transmission Solenoid Assembly harness connector. Is the resistance below 5.0 ohms between any other circuit? Yes → Repair the 2-3 Solenoid Control circuit for a short to other circuits. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 6	All

2-3 SOLENOID CIRCUIT (3, 72) — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off to the lock position. Disconnect the Transmission Control Module C2 harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between the 2-3 Solenoid Control circuit and the Solenoid Supply Voltage Circuit in the Transmission Control Module C2 harness connector. Is the resistance between 2.5 and 6.5 ohms? Yes → Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Replace the 2-3 Solenoid per the Service Information. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
7	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. **NOTE: Check the Technical Service Bulletins.** Were there any problems found? Yes → Repair as necessary Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
3-4 SOLENOID CIRCUIT (4, 73)

When Monitored and Set Condition:

3-4 SOLENOID CIRCUIT (4, 73)

When Monitored: Always monitored with system active at each ignition cycle.

Set Condition: If the TCM detects a short to ground or battery on the solenoid control circuit, shorted solenoid, open solenoid, or an open or shorted solenoid control circuit driver in the TCM.

POSSIBLE CAUSES
INTERMITTENT WIRING AND CONNECTORS
3-4 SOLENOID CONTROL CIRCUIT OPEN
3-4 SOLENOID CONTROL CIRCUIT SHORT TO GROUND
3-4 SOLENOID CONTROL CIRCUIT SHORT TO OTHER CIRCUITS
3-4 SOLENOID
TCM - 3-4 SOLENOID CIRCUIT

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

3-4 SOLENOID CIRCUIT (4, 73) — Continued

TEST	ACTION	APPLICABILITY
2	Ignition on, engine not running. With the DRBIII®, erase DTCs. With the DRBIII®, perform the Solenoid Test. With the DRBIII®, read DTCs. Did the DTC, 3-4 SOLENOID CIRCUIT, reset? Yes → Go To 3 No → Go To 7	All
3	Turn the ignition off to the lock position. Disconnect the Transmission Control Module C2 harness connector. Disconnect the Transmission Solenoid Assembly harness connector **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the 3-4 Solenoid Control circuit from the TCM C2 harness connector to the Transmission Solenoid Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the 3-4 Solenoid Control circuit for an open. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off to the lock position. Disconnect the Transmission Control Module C2 harness connector. Disconnect the Transmission Solenoid Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the 3-4 Solenoid Control circuit. Is the resistance below 5.0 ohms? Yes → Repair the 3-4 Solenoid Control circuit for a short to ground. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off to the lock position. Disconnect the Transmission Control Module C2 harness connector. Disconnect the Transmission Solenoid Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the 3-4 Solenoid Control circuit between all other circuits in the Transmission Solenoid harness connector. Is the resistance below 5.0 ohms between any other circuit? Yes → Repair the 3-4 Solenoid Control circuit for a short to other circuits. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 6	All

3-4 SOLENOID CIRCUIT (4, 73) — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off to the lock position. Disconnect the Transmission Control Module C2 harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between the 3-4 Solenoid Control circuit and the Solenoid Supply Voltage Circuit in the Transmission Control Module C2 harness connector. Is the resistance between 2.5 and 6.5 ohms? Yes → Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Replace the 3-4 Solenoid per the Service Information. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
7	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. **NOTE: Check the Technical Service Bulletins.** Were there any problems found? Yes → Repair as necessary Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
ABS BRAKE MESSAGE (33)

When Monitored and Set Condition:

ABS BRAKE MESSAGE (33)

When Monitored: Valid Brake CAN message received at least once and CAN Bus Circuit, ABS CAN Message Missing, ABS CAN Message Incorrect are not active.

Set Condition: Signal "brake-light switch" not valid- ABS sending invalid value.

POSSIBLE CAUSES
CAN C BUS CIRCUIT 37 DTC PRESENT
ABS DTCS PRESENT
ABS - BRAKE MESSAGE ERROR
TCM - BRAKE MESSAGE ERROR

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	Ignition on, engine not running. With the DRBIII®, read Transmission DTCs. **NOTE: If the DTC, CAN BUS CIRCUIT 37, is present, perform diagnostics on that symptom first.** Is the DTC, CAN BUS CIRCUIT 37, present? Yes → Refer to the Transmission category and perform the appropriate symptom. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All

ABS BRAKE MESSAGE (33) — Continued

TEST	ACTION	APPLICABILITY
3	Ignition on, engine not running. With the DRBIII®, read ABS DTCs. Are there any ABS or bus related DTCs present? Yes → Repair all ABS DTCS before proceeding. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	Replace and program the ABS Control Module. With the DRBIII®, erase Transmission DTCs. Start the engine. With the brakes firmly applied, shift the gear selector into drive. With the DRBIII®, read Transmission DTCs. Did the DTC, ABS BRAKE MESSAGE, reset? Yes → Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
ABS CAN MESSAGE INCORRECT (81)

When Monitored and Set Condition:

ABS CAN MESSAGE INCORRECT (81)

When Monitored: ABS CAN messages received at least once and CAN Bus Circuit (37) is not active

Set Condition: DTC Detected if the number of bytes incorrect for CAN ID.

POSSIBLE CAUSES
ABS - INTERNAL
TCM - INTERNAL

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	Turn the ignition off to the lock position. Replace the ABS Control Module per the Service Information. Ignition on, engine not running. With the DRBIII®, erase Transmission DTCs. Start the engine and with the brakes firmly applied place the gear selector into Drive. With the DRBIII®, read Transmission DTCs. Did the DTC, ABS CAN MESSAGES INCORRECT, reset? Yes → Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Test complete. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
ABS CAN MESSAGE MISSING (38)

When Monitored and Set Condition:

ABS CAN MESSAGE MISSING (38)

When Monitored: CAN Bus Circuit error not present, 1 second after ignition on and not in Park or Neutral, no System Overvoltage or System Undervoltage conditions present, or transmission in Park or Neutral and engine RPM greater than 850 RPM

Set Condition: This DTC is set when a CAN ID was not received in the required time are not being sent from the ABS Controller. NOTE: The ABS controller is powered by the run only ignition feed. This means that this DTC will be set if the key is placed in the start position with the transmission in gear or if in Park or Neutral and the engine RPM is greater than 850 RPM.

POSSIBLE CAUSES
ABS DTC SET IF ATTEMPT TO START VEHICLE IN GEAR
CAN BUS CIRCUIT 37 - DTC PRESENT
CAN C BUS +/- CIRCUIT OPEN
ABS DTCS PRESENT
ABS - CAN MESSAGE MISSING
TCM - CAN MESSAGE MISSING

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

ABS CAN MESSAGE MISSING (38) — Continued

TEST	ACTION	APPLICABILITY
2	**NOTE: This DTC can be erroneously set if the vehicle was started in gear or with the engine running.** Was the vehicle started in gear or with the engine running? Yes → Note: If the ignition switch is moved to the run/start (crank) position with the shifter lever not in the Park or Neutral position, or if the run/start with the engine rpm >850 an ABS CAN Message Missing DTC will be set. Erase DTC and return to customer. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	Ignition on, engine not running. With the DRBIII®, read Transmission DTCs. **NOTE: If the DTC, CAN BUS CIRCUIT 37, is present, perform diagnostics on that symptom first.** Is the DTC, CAN BUS CIRCUIT 37, present? Yes → Refer to the Transmission category and perform the appropriate symptom. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off to the lock position. Disconnect the ABS harness connector. Disconnect the TCM C2 harness connector. **NOTE: Check connectors - Clean/repair as necessary.** Measure the resistance of the CAN C Bus + circuit between the ABS harness connector and the TCM C2 harness connector. Measure the resistance of the CAN C Bus - circuit between the ABS harness connector and the TCM C2 harness connector. Is the resistance above 5.0 ohms on either circuit? Yes → Repair the CAN C BUS + or - circuit for an open. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	All
5	Ignition on, engine not running. With the DRBIII®, read ABS DTCs. Are there any performance or bus related ABS DTCs present? Yes → Repair all ABS DTCs before proceeding. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 6	All

ABS CAN MESSAGE MISSING (38) — Continued

TEST	ACTION	APPLICABILITY
6	Replace and program the ABS Control Module. With the DRBIII®, erase Transmission DTCs. Start the engine. With the brakes firmly applied, shift the gear selector into drive. With the DRBIII®, read Transmission DTCs. Did the DTC, ABS CAN MESSAGE MISSING, reset? Yes → Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Test complete. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
ABS LF SENSOR MESSAGE (25)

When Monitored and Set Condition:

ABS LF SENSOR MESSAGE (25)

When Monitored: Valid ABS CAN messages received at least once and the CAN Bus circuit, ABS CAN Message Missing, ABS CAN Message Incorrect are not active

Set Condition: ABS signal ″Wheel Speed Front Left″ not valid or ABS has detected a sensor failure.

POSSIBLE CAUSES
CAN BUS CIRCUIT 37 DTC PRESENT
ABS DTCS PRESENT
ABS CONTROL MODULE - ABS LF SENSOR MESSAGE
TCM - ABS LF SENSOR MESSAGE

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

ABS LF SENSOR MESSAGE (25) — Continued

TEST	ACTION	APPLICABILITY
2	Ignition on, engine not running. With the DRBIII®, read Transmission DTCs. **NOTE: If the DTC, CAN BUS CIRCUIT 37, is present, perform diagnostics on that symptom first.** Is the DTC, CAN BUS CIRCUIT 37, present? Yes → Refer to the Transmission category and perform the appropriate symptom. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	Ignition on, engine not running. With the DRBIII®, read ABS DTCs. Are there any ABS DTCs present? Yes → Refer to the ABS category and perform the appropriate symptom. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off to the lock position. Replace the ABS Control Module per the Service Information. With the DRBIII®, erase Transmission DTCs. Road test the Vehicle. With the DRBIII®, read Transmission DTCs. Does the DTC, ABS LF SENSOR MESSAGE, reset? Yes → Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Test complete. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
ABS LR SENSOR MESSAGE (23)

When Monitored and Set Condition:

ABS LR SENSOR MESSAGE (23)

When Monitored: Valid ABS CAN messages received at least once and the CAN Bus circuit, ABS CAN Message Missing, ABS CAN Message Incorrect are not active

Set Condition: ABS signal ″wheel speed rear left″ not valid or ABS has detected a sensor failure.

POSSIBLE CAUSES
CAN BUS CIRCUIT 37 DTC PRESENT
ABS DTCS PRESENT
ABS CONTROL MODULE - ABS LR SENSOR MESSAGE
TCM - ABS LR SENSOR MESSAGE

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. No → Test complete. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
CAN BUS CIRCUIT (37)

When Monitored and Set Condition:

CAN BUS CIRCUIT (37)

When Monitored: Always monitored with system active at each ignition cycle.

Set Condition: Open circuit in the CAN C Bus (+) circuit or CAN C Bus (-) circuit, Short to ground of CAN C Bus (+) circuit or CAN C Bus (-) circuit, Short to Voltage of CAN C Bus (+) circuit or CAN C Bus (-) circuit, CAN C Bus (+) circuit shorted to CAN C Bus (-) circuit, or a TCM failure. Note: All CAN message missing DTCS will also be present, which indicates a Bus Failure.

POSSIBLE CAUSES
CAN C BUS(+) SHORT TO CAN C BUS (-)
CAN C BUS (+) AND/OR CAN C BUS (-) CIRCUIT OPEN
CAN C BUS (+) AND/OR CAN C BUS (-) CIRCUIT SHORT TO GROUND
CAN C BUS (+) AND/OR CAN C BUS (-) CIRCUIT SHORT TO OTHER CIRCUITS
ABS - TERMINATING RESISTOR
PCM/ECM - CAN BUS CIRCUIT
TCM - TERMINATING RESISTOR

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Continue Go To 2	All

CAN BUS CIRCUIT (37) — Continued

TEST	ACTION	APPLICABILITY
2	**NOTE: If the CAN BUS CIRCUIT (37) DTC is present, all the CAN MESSAGE MISSING DTCs will be set also. Ignore the Missing Message DTCs and perform the CAN BUS CIRCUIT (37) DTC test.** Turn the ignition off to the lock position. Disconnect the TCM C2 harness connector. Disconnect the PCM/ECM harness connector. Disconnect the ABS harness connector. **NOTE: Check connectors - Clean/repair as necessary.** Measure the resistance of both the CAN C Bus (+) circuit and the CAN C Bus (-) circuit between the TCM C2 harness connector and both the PCM/ECM harness connector and the ABS harness connector. Is the resistance above 5.0 ohms on either Bus circuit? Yes → Repair the CAN C Bus (+) and/or CAN C Bus (-) circuit for an open. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off to the lock position. Disconnect the ABS harness connector. Disconnect the PCM/ECM harness connector. Disconnect the TCM C2 harness connector. **NOTE: Check connectors - Clean/repair as necessary.** Measure the resistance between the CAN C Bus (+) circuit and the CAN C Bus (-) circuit. Is the resistance below 5.0 ohms? Yes → Repair the short between the CAN C Bus (+) circuit and the CAN C Bus (-) circuit. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off to the lock position. Disconnect the TCM C2 harness connector. Disconnect the PCM/ECM harness connector. Disconnect the ABS harness connector. **NOTE: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and both the CAN C Bus (+) circuit and the CAN C Bus (-) circuit. Is the resistance below 5.0 ohms on either Bus circuit? Yes → Repair the CAN C Bus (+) and/or CAN C Bus (-) circuit for a short to ground. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	All

CAN BUS CIRCUIT (37) — Continued

TEST	ACTION	APPLICABILITY
5	Turn the ignition off to the lock position. Disconnect the TCM C2 harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of both the CAN C Bus (+) circuit and the CAN C Bus (-) circuit to all other circuits in the TCM C2 harness connector. Is the resistance below 5.0 ohms between any other circuit? Yes → Repair the CAN C Bus (+) and/or CAN C Bus (-) circuit for a short to other circuits. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 6	All
6	Turn the ignition off to the lock position. Disconnect the PCM/ECM harness connector. **NOTE: Check connectors - Clean/repair as necessary.** **NOTE: Make sure both the TCM and the ABS harness connectors are connected before taking this measurement.** Measure the resistance between the CAN C Bus (+) circuit and the CAN C Bus (-) circuit in the PCM/ECM harness connector. Is the resistance 60.0 ohms, ± 3.0 ohms? Yes → Replace the Powertrain/Engine Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 7	All
7	Turn the ignition off to the lock position. Disconnect the ABS harness connector. **NOTE: Make sure both the TCM and the ECM harness connectors are connected before taking this measurement.** Measure the resistance between the CAN C Bus (+) circuit and the CAN C Bus (-) circuit in the ABS harness connector. Is the resistance 120 ohms, ± 2.0 ohms? Yes → Replace the ABS Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
ENGINE APP/TPS MESSAGE (26)

When Monitored and Set Condition:

ENGINE APP/TPS MESSAGE (26)

When Monitored: When a valid Accelerator Pedal Position (APP) or Throttle Position Sensor (TPS) CAN Message Received at least once and the DTCs, CAN Bus Circuit, Engine CAN Message Missing and Engine CAN Message Incorrect are not active.

Set Condition: Accelerator Pedal Position (APP) or Throttle Position Sensor (TPS) Message not valid or a ECM or PCM Engine Sensor DTC detected.

POSSIBLE CAUSES
CAN BUS CIRCUIT 37 DTC PRESENT
ENGINE APP OR TPS DTCS PRESENT
ENGINE COMMUNICATION DTCS PRESENT
INTERMITTENT WIRING AND CONNECTORS
PCM/ECM - ENGINE APP/TPS MESSAGE

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. ENGINE APP/TPS MESSAGE (26) — Continued

TEST	ACTION	APPLICABILITY
2	Ignition on, engine not running. With the DRBIII®, read Transmission DTCs. **NOTE: If the DTC, CAN BUS CIRCUIT 37, is present, perform diagnostics on that symptom first.** Is the DTC, CAN BUS CIRCUIT 37, present? Yes → Refer to the Transmission category and perform the appropriate symptom. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	Ignition on, engine not running. With the DRBIII®, read Transmission DTCs. Is the DTC ENGINE APPS/TPS MESSAGE displayed as ACTIVE? Yes → Go To 4 No → Go To 8	All
4	Ignition on, engine not running. With the DRBIII®, read Engine DTCs. Are there any Engine bus related DTCs present? Yes → Refer to the Communication category and perform the appropriate symptom. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	All
5	Ignition on, engine not running. With the DRBIII®, read Engine DTCs. Are there any APP or TPS DTCs present? Yes → Refer to the Powertrain category and perform the appropriate symptom. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 6	All
6	Replace the Transmission Control Module. Perform W5A400 TRANSMISSION VER TEST-1 Did the DTC ″ENGINE TPS MESSAGE″ reset? Yes → Go To 7 No → Test Complete.	All
7	If there are no possible causes remaining, view repair. Repair Replace the Powertrain/Engine Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

ENGINE APP/TPS MESSAGE (26) — Continued

TEST	ACTION	APPLICABILITY
8	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. **NOTE: Check for any Technical Service Bulletins that may apply.** Were there any problems found? Yes → Repair as necessary Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
ENGINE CAN MESSAGE INCORRECT (85)

When Monitored and Set Condition:

ENGINE CAN MESSAGE INCORRECT (85)

When Monitored: CAN-ID received at least once and CAN Bus Circuit (37) is not active.

Set Condition: DTC Detected if the number of bytes incorrect for CAN ID.

POSSIBLE CAUSES
ENGINE DTCS PRESENT
PCM/ECM - ENGINE CAN MESSAGE INCORRECT
TCM - ENGINE CAN MESSAGE INCORRECT

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	Ignition on, engine not running. With the DRBIII®, read Engine DTCs. Are there any performance or bus related Engine DTCs present? Yes → Refer to the Powertrain category and perform the appropriate symptom. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All

ENGINE CAN MESSAGE INCORRECT (85) — Continued

TEST	ACTION	APPLICABILITY
3	Replace and program the PCM/ECM per the Service Information. With the DRBIII®, erase Transmission DTCs. Start the engine. With the brakes firmly applied, shift the gear selector into drive. With the DRBIII®, read Transmission DTCs. Did the DTC, ENGINE CAN MESSAGE INCORRECT, reset? Yes → Go To 4 No → Test Complete Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
4	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
ENGINE CAN MESSAGE MISSING (35, 36, 39, 82, 83)

When Monitored and Set Condition:

ENGINE CAN MESSAGE MISSING (35, 36, 39, 82, 83)

When Monitored: CAN Bus circuit error not present, 1 second after ignition on and not in Park or Neutral, no System Overvoltage or System Undervoltage conditions present, or transmission in Park or Neutral and engine RPM greater than 850 RPM.

Set Condition: This DTC is set if a CAN ID was not received in the required time, being sent from the Engine Controller.

POSSIBLE CAUSES
CAN BUS CIRCUIT 37 - DTC PRESENT
CAN C BUS +/- CIRCUIT OPEN
ENGINE DTCS PRESENT
PCM/ECM - ENGINE CAN MESSAGE MISSING
TCM - ENGINE CAN MESSAGE MISSING

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. ENGINE CAN MESSAGE MISSING (35, 36, 39, 82, 83) — Continued

TEST	ACTION	APPLICABILITY
2	Ignition on, engine not running. With the DRBIII®, read Transmission DTCs. **NOTE: If the DTC, CAN BUS CIRCUIT 37, is present, perform diagnostics on that symptom first.** Is the DTC, CAN BUS CIRCUIT 37, present? Yes → Refer to the Transmission category and perform the appropriate symptom. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off to the lock position. Disconnect the PCM/ECM harness connector(s). Disconnect the TCM C2 harness connector. **NOTE: Check connectors - Clean/repair as necessary.** Measure the resistance of the CAN C Bus + circuit between the PCM/ECM harness connector and the TCM C2 harness connector. Measure the resistance of the CAN C Bus - circuit between the PCM/ECM harness connector and the TCM C2 harness connector. Is the resistance above 5.0 ohms on either circuit? Yes → Repair the CAN C BUS + or - circuit for an open. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	Ignition on, engine not running. With the DRBIII®, read Engine DTCs. Are there any performance or bus related Engine DTCs present? Yes → Refer to the Powertrain category and perform the appropriate symptom. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	All
5	Replace and program the PCM/ECM per the Service Information. With the DRBIII®, erase Transmission DTCs. Start the engine. With the brakes firmly applied, shift the gear selector into drive. With the DRBIII®, read Transmission DTCs. Did the DTC, ENGINE CAN MESSAGE MISSING, reset? Yes → Go To 6 No → Test Complete Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
6	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
ENGINE OVERSPEED (49)

When Monitored and Set Condition:

ENGINE OVERSPEED (49)

When Monitored: Valid Engine RPM message received at least once, the CAN Bus Circuit and Engine CAN Message Missing are not active.

Set Condition: If the engine speed increases above 5100 RPM.

POSSIBLE CAUSES
ENGINE - MECHANICAL PROBLEM
TRANSMISSION - MECHANICAL PROBLEM
PCM/ECM - ENGINE OVERSPEED
TCM - ENGINE OVERSPEED

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	Determine if there are any Engine Mechanical problems present. Are there any Engine Mechanical problems present? Yes → Refer to the Service Information for the proper repair procedure. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All

ENGINE OVERSPEED (49) — Continued

TEST	ACTION	APPLICABILITY
3	Determine if there are any Transmission Mechanical problems present. Remove the Transmission Oil Pan and inspect for debris or a plugged Transmission Oil Filter. Is there any debris, plugged Transmission Oil Filter, or signs of an Internal Transmission problem? Yes → Refer to the Service Information for the proper repair procedure. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	**NOTE: The Engine and Transmission must not have mechanical problems and be operating normally before proceeding with this test.** Turn the ignition off to the lock position. Replace and program the PCM/ECM Control Module per the Service Information. With the DRBIII®, erase Transmission DTCs. Road test the Vehicle. With the DRBIII®, read Transmission DTCs. Does the DTC, ENGINE OVERSPEED, reset? Yes → Go To 5 No → Replacing the PCM/ECM has corrected the problem. Perform the Powertrain Verification test. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
5	If there are no possible causes remaining, view repair. Repair Replace the TCM. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
ENGINE RPM MESSAGE (28)

When Monitored and Set Condition:

ENGINE RPM MESSAGE (28)

When Monitored: Valid TPS CAN message received at least once CAN Bus Circuit, Engine CAN Message Missing and Engine CAN Message Incorrect are not active.

Set Condition: Signal ″engine speed″ not valid or PCM/ECM error.

POSSIBLE CAUSES
CAN BUS CIRCUIT 37 DTC PRESENT
ENGINE DTCS PRESENT
PCM/ECM - ENGINE RPM MESSAGE
TCM - ENGINE RPM MESSAGE

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. 2	Ignition on, engine not running. With the DRBIII®, read Transmission DTCs. **NOTE: If the DTC, CAN BUS CIRCUIT 37, is present, perform diagnostics on that symptom first.** Is the DTC, CAN BUS CIRCUIT 37, present? Yes → Refer to the Transmission category and perform the appropriate symptom. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All

ENGINE RPM MESSAGE (28) — Continued

TEST	ACTION	APPLICABILITY
3	Ignition on, engine not running. With the DRBIII®, read Engine DTCs. Are there any performance or bus related Engine DTCs present? Yes → Refer to the Powertrain category and perform the appropriate symptom. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off to the lock position. Replace and program the PCM/ECM per the Service Information. With the DRBIII®, erase Transmission DTCs. Start the engine. With the brakes firmly applied, shift the gear selector into drive. With the DRBIII®, read Transmission DTCs. Did the DTC, ENGINE RPM MESSAGE, reset? Yes → Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
ENGINE T-CASE SW MESSAGE (44)

When Monitored and Set Condition:

ENGINE T-CASE SW MESSAGE (44)

When Monitored: Valid T-Case CAN message received at least once, the CAN Buss Circuit and Engine CAN Message Missing are not active.

Set Condition: Transfer Case Status signal not valid - indicates possible T-Case sensor error.

POSSIBLE CAUSES
CAN BUS CIRCUIT 37 DTC PRESENT
ENGINE DTCS PRESENT
PCM/ECM - ENGINE T-CASE SWITCH MESSAGE
TCM - ENGINE T-CASE SWITCH MESSAGE

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

ENGINE T-CASE SW MESSAGE (44) — Continued

TEST	ACTION	APPLICABILITY
2	Ignition on, engine not running. With the DRBIII®, read Transmission DTCs. **NOTE: If the DTC, CAN BUS CIRCUIT 37, is present, perform diagnostics on that symptom first.** Is the DTC, CAN BUS CIRCUIT 37, present? Yes → Refer to the Transmission category and perform the appropriate symptom. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	Ignition on, engine not running. With the DRBIII®, read Engine DTCs. Are there any Transfer Case or Bus related Engine DTCs present? Yes → Refer to the Powertrain category and perform the appropriate symptom. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off to the lock position. Replace and program the PCM/ECM per the Service Information. With the DRBIII®, erase Transmission DTCs. Start the engine. With the brakes firmly applied, shift the gear selector into drive. With the DRBIII®, read Transmission DTCs. Did the DTC, ENGINE T-CASE SWITCH MESSAGE, reset? Yes → Go To 5 No → Test Complete Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
5	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
ENGINE TEMP MESSAGE (43)

When Monitored and Set Condition:

ENGINE TEMP MESSAGE (43)

When Monitored: Valid Engine Temp CAN message received at least once and CAN Bus Circuit error, Engine CAN Message Missing and Engine CAN Messages Incorrect are not active.

Set Condition: Engine coolant temperature signal is not valid - indicates possible coolant temperature sensor error.

POSSIBLE CAUSES
CAN BUS CIRCUIT 37 DTC PRESENT
ENGINE DTCS PRESENT
PCM/ECM- ENGINE TEMP MESSAGE
TCM - ENGINE TEMP MESSAGE

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. ENGINE TEMP MESSAGE (43) — Continued

TEST	ACTION	APPLICABILITY
2	Ignition on, engine not running. With the DRBIII®, read Transmission DTCs. **NOTE: If the DTC, CAN BUS CIRCUIT 37, is present, perform diagnostics on that symptom first.** Is the DTC, CAN BUS CIRCUIT 37, present? Yes → Refer to the Transmission category and perform the appropriate symptom. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	Ignition on, engine not running. With the DRBIII®, read Engine DTCs. Are there any Engine Temperature Sensor DTCs present? Yes → Refer to the Powertrain category and perform the appropriate symptom. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	Replace and program the PCM/ECM per the Service Information. With the DRBIII®, erase Transmission DTCs. Start the engine. With the brakes firmly applied, shift the gear selector into drive. With the DRBIII®, read Transmission DTCs. Did the DTC, ENGINE TEMP MESSAGE, reset? Yes → Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Test complete. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
ENGINE TORQUE MESSAGE INCORRECT (27, 29, 31, 32)

When Monitored and Set Condition:

ENGINE TORQUE MESSAGE INCORRECT (27, 29, 31, 32)

When Monitored: Valid Torque CAN messages received at least once and CAN Bus Circuit, Engine CAN Message Missing and Engine CAN Message Incorrect are not active.

Set Condition: Engine torque message not valid or PCM/ECM controller error.

POSSIBLE CAUSES
ENGINE DTCS PRESENT
PCM/ECM - ENGINE TORQUE MESSAGE INCORRECT
TCM - TORQUE MESSAGE INCORRECT

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. 2	Ignition on, engine not running. With the DRBIII®, read Engine DTCs. Are there any performance or bus related Engine DTCs present? Yes → Refer to the Powertrain category and perform the appropriate symptom. No → Go To 3	All

ENGINE TORQUE MESSAGE INCORRECT (27, 29, 31, 32) — Continued

TEST	ACTION	APPLICABILITY
3	Replace and program the ECM/ECM per the Service Information. With the DRBIII®, erase Transmission DTCs. Drive the vehicle performing multiple aggressive upshifts and downshifts. With the DRBIII®, read Transmission DTCs. Did the DTC, ENGINE TORQUE MESSAGE INCORRECT, reset? Yes → Go To 4 No → Test Complete Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
4	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:

ENGINE TORQUE REDUCTION (54)

When Monitored and Set Condition:

ENGINE TORQUE REDUCTION (54)

When Monitored: Engine intervention active for at least 20 ms, no engine torque errors, engine torque demand is greater than 0.

Set Condition: Torque Reduction acknowledge bit - not set, no shift aborts, the error flag ″torque reduction acknowledge″ is not set, Engine controller not supporting torque requests.

POSSIBLE CAUSES
CAN BUS CIRCUIT 37 - DTC PRESENT
CAN C BUS +/- CIRCUIT OPEN
ENGINE DTCS PRESENT
PCM/ECM - ENGINE CAN MESSAGE MISSING
TCM - ENGINE CAN MESSAGE MISSING

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. ENGINE TORQUE REDUCTION (54) — Continued

TEST	ACTION	APPLICABILITY
2	Ignition on, engine not running. With the DRBIII®, read Transmission DTCs. **NOTE: If the DTC, CAN BUS CIRCUIT 37, is present, perform diagnostics on that symptom first.** Is the DTC, CAN BUS CIRCUIT 37, present? Yes → Refer to the Transmission category and perform the appropriate symptom. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off to the lock position. Disconnect the PCM/ECM harness connector(s). Disconnect the TCM C2 harness connector. Measure the resistance of the CAN C Bus + circuit between the PCM/ECM harness connector and the TCM C2 harness connector. Measure the resistance of the CAN C Bus - circuit between the PCM/ECM harness connector and the TCM C2 harness connector. Is the CAN C Bus + or - circuit open? Yes → Repair the CAN C BUS + or - circuit for an open. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	Ignition on, engine not running. With the DRBIII®, read Engine DTCs. Are there any performance or bus related Engine DTCs present? Yes → Refer to the Powertrain category and perform the appropriate symptom. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	All
5	Replace and program the PCM/ECM per the Service Information. With the DRBIII®, erase Transmission DTCs. Start the engine. With the brakes firmly applied, shift the gear selector into drive. With the DRBIII®, read Transmission DTCs. Did the DTC, ENGINE CAN MESSAGE MISSING, reset? Yes → Go To 6 No → Test Complete Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
6	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
IMPROPER GEAR (55)

When Monitored and Set Condition:

IMPROPER GEAR (55)

When Monitored: Engine RPM greater than 450 and output speed (ABS) greater than 180 RPM. No Input Speed sensor N2 - N3, Shift lever, Transfer Case, and/or ABS wheel speed DTCs present.

Set Condition: The TCM compares the calculated gear with the gear the transmission has actually engaged. If the actual gear differs from the gear calculated by the TCM, the TCM value is adjusted to the engaged gear and a counter is increased by 2. If after a shift the engaged gear and the calculated gear still match , the counter is decreased by 1 point. A DTC is detected as soon as the counter exceeds a threshold. If the fault is detected 3 consecutive ignition cycles the transmission will be placed in Limp-in and the MIL activated.

POSSIBLE CAUSES
ABS DTCS PRESENT
SOLENOID DTCS PRESENT
INTERNAL TRANSMISSION
TCM - IMPROPER GEAR

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

IMPROPER GEAR (55) — Continued

TEST	ACTION	APPLICABILITY
2	Ignition on, engine not running. With the DRBIII®, read Transmission DTCs. Are there any Transmission Solenoid DTCs present? Yes → Refer to the Transmission category and perform the appropriate symptom. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	With the DRBIII®, read ABS DTCs. Are there any ABS DTCs present? Yes → Refer to the Antilock Brake category and perform the appropriate symptom. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	Remove and inspect the Transmission Valve Body and Solenoid Assembly per the Service Information. **NOTE: This DTC is usually set due to a internal transmission problem such as but not limited to: stuck solenoid or valve and/or contamination in the valve body, broken springs, leaking clutch seals, dislodged or broken snap ring.** Inspect internal transmission per the Service Information. Where there any problems found? Yes → Repair internal transmission as necessary. Refer to the Service Information for the proper repair procedure. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
IMPROPER RATIO (50)

When Monitored and Set Condition:

IMPROPER RATIO (50)

When Monitored: Engine rpm greater than 450 rpm, output speed greater than 180 rpm, no N2 - N3 input speed sensor errors present, no gear selector lever errors present, no ABS system errors, no transfer case errors present, and all wheel speeds above 450 rpm.

Set Condition: No shifting operation and detected gear is not the actual gear No shifting operation - detected (calculated) gear is less than actual(expected) gear or no plausible gear is calculated or Actual turbine speed - calculated turbine speed > 300 rpm or calculated transmission ration is above threshold. During an Upshift - detected (calculated) gear is less than actual(expected) gear-1. During Downshift - detected (calculated) gear is less than actual (expected) gear

POSSIBLE CAUSES
TRANSMISSION MECHANICAL PROBLEM
TCM - IMPROPER RATIO

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

IMPROPER RATIO (50) — Continued

TEST	ACTION	APPLICABILITY
2	Determine if there are any Transmission Mechanical problems present. Remove the Transmission Oil Pan and inspect for debris or a plugged Transmission Oil Filter. Refer to the Service Information for proper removal and inspection procedures. Is there any Debris, plugged Transmission Oil filter, or signs of an Internal Transmission problem? Yes → Refer to the Service Information for the proper repair procedure. Pay particular attention to the Valve body components and stuck solenoids. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
INPUT SENSOR OVERSPEED (15)

When Monitored and Set Condition:

INPUT SENSOR OVERSPEED (15)

When Monitored: Whenever the N2 input speed sensor is greater than 0 rpm

Set Condition: If the rpm of the N2 or N3 input speed sensor is greater than 7700 rpm

POSSIBLE CAUSES
INTERMITTENT WIRING AND CONNECTORS
INTERNAL TRANSMISSION
TCM - INPUT SENSOR OVERSPEED

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

INPUT SENSOR OVERSPEED (15) — Continued

TEST	ACTION	APPLICABILITY
2	Ignition on, engine not running. With the DRBIII®, erase Transmission DTCs. Raise the vehicle on the hoist. Start the engine. **NOTE: This condition indicates a catastrophic transmission failure.** With the DRBIII® in Sensors, monitor the N2 and N3 Speed Sensors. Firmly apply the brakes and place the gear selector in Drive (D). Release the brakes and raise the engine RPM to allow the Transmission to upshift to the 2-3 and 3-4 shift schedule. **CAUTION: BE SURE TO KEEP HANDS AND FEET CLEAR OF ROTATING WHEELS.** Did either the N2 or N3 Speed Sensors display a RPM above 7700? Yes → Go To 3 No → Go To 5	All
3	Remove the Transmission Oil Pan and inspect for debris or a plugged Transmission Oil Filter. Is there any debris, plugged Transmission Oil Filter, or signs of an Internal Transmission problem? Yes → Repair Internal Transmission as necessary. Refer to the Service Information for proper repair procedures. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
5	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. **NOTE: Check for any Technical Service Bulletins that may apply.** Were there any problems found? Yes → Repair as necessary Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
INPUT SENSORS MISMATCH (14)

When Monitored and Set Condition:

INPUT SENSORS MISMATCH (14)

When Monitored: Engine speed greater than 450 rpm, no engine speed DTC's, no TCM under-voltage system operation, no output speed sensor DTC's (signal from the ABS system), all wheel speeds above 250 rpm (signal from the ABS system), no rear wheel speed DTC's (signal from the ABS system), and no wheel slip detected (signal from the ABS system), no shifting operation, N3 input speed sensor greater than 800 rpm and N2 input speed sensor greater than 0 rpm and the TCM not in reset.

Set Condition: If the speed difference between the N2 and N3 input speed sensors is greater than 150 rpm.

POSSIBLE CAUSES
SPEED SENSOR DTCS PRESENT
INTERMITTENT WIRING AND CONNECTORS
INTERNAL TRANSMISSION
TCM - INPUT SPEED SENSOR MISMATCH

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

INPUT SENSORS MISMATCH (14) — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, read DTCs. Are any Speed Sensor or Sensor Supply DTCs present? Yes → Repair any Speed Sensor and/or Sensor Supply DTCs before proceeding with test. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	Ignition on, engine not running. With the DRBIII®, erase Transmission DTCs. Start the engine. Drive the vehicle to speeds to allow multiple 2-3 and 3-4 upshifts. Does the DTC ″INPUT SENSOR MISMATCH″ reset and displayed as ″ACTIVE″? Yes → Go To 4 No → Go To 6	All
4	Remove the Transmission Oil Pan and inspect for debris or a plugged Transmission Oil Filter. Is there any debris, plugged Transmission Oil Filter, or signs of an Internal Transmission problem? Yes → Repair Internal Transmission as necessary. Refer to the Service Information for proper repair procedures. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	All
5	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
6	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. **NOTE: Check for any Technical Service Bulletins that may apply.** Were there any problems found? Yes → Repair as necessary Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
INTERNAL CONTROLLER

When Monitored and Set Condition:

INTERNAL CONTROLLER

When Monitored: Always monitored with system active at each ignition cycle

Set Condition: This code is set whenever Transmission Control Module (TCM) senses an internal error. If this Internal Controller DTC is set with any Solenoid DTC's repair the Solenoid DTC's first, erase all DTC's, then verify the Internal Controller DTC sets before replacing the TCM.

POSSIBLE CAUSES
TCM - INTERNAL ERROR

TEST	ACTION	APPLICABILITY
1	If there are no possible causes remaining, view repair. Repair The Transmission Control Module is reporting internal errors and must be replaced. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
INTERNAL SHIFTER FAILURE (76)

When Monitored and Set Condition:

INTERNAL SHIFTER FAILURE (76)

When Monitored: Always monitored with system active at each ignition cycle.

Set Condition: Shifter sends an erroneous signal indicating the shifter detected a fault. Internal shifter fault, shifter held in an intermediate position for more than 30 seconds.

POSSIBLE CAUSES
SHIFTER OUT OF ADJUSTMENT
SHIFTER HELD INTERMEDIATE POSITION
SHIFTER ASSEMBLY - INTERNAL

TEST	ACTION	APPLICABILITY
1	Check the shifter adjustment per the Service Information. **NOTE: Verify the proper LED is illuminated and matches the selected gear position.** Was the shifter properly adjusted and LEDs illuminated correctly? Yes → Go To 2 No → Adjust the Shifter Assembly per the Service Information. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
2	**NOTE: This DTC can be set, if the driver rests their hand on the shifter while driving.** With the DRBIII®, erase DTCs. Place the shifter in each gear position for 30 seconds each. **NOTE: Remember to remove your hand from the shifter after selecting each of the gear positions.** Did the INTERNAL SHIFTER FAILURE DTC set? Yes → Go To 3 No → Advise the customer that resting your hand on the shifter or moving the shifter while driving can set this DTC. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
3	If there are no possible causes remaining, view repair. Repair Yes → Replace the Shifter Assembly. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
MOD. PRESS SOLENOID CIRCUIT (6)

When Monitored and Set Condition:

MOD. PRESS SOLENOID CIRCUIT (6)

When Monitored: Always monitored with system active at each ignition cycle.

Set Condition: If the TCM detects a short to ground or battery on the solenoid control circuit, shorted solenoid, open solenoid, or an open or shorted solenoid control circuit driver in the TCM.

POSSIBLE CAUSES
INTERMITTENT WIRING AND CONNECTORS
MOD. PRESS SOLENOID CONTROL CIRCUIT OPEN
MOD. PRESS SOLENOID CONTROL CIRCUIT SHORT TO GROUND
MOD. PRESS SOLENOID CONTROL CIRCUIT SHORT TO OTHER CIRCUITS
MOD PRESS SOLENOID
TCM - MOD. PRESS SOLENOID CIRCUIT

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

MOD. PRESS SOLENOID CIRCUIT (6) — Continued

TEST	ACTION	APPLICABILITY
2	Ignition on, engine not running. With the DRBIII®, erase DTCs. With the DRBIII®, perform the Solenoid Test With the DRBIII®, read DTCs. Did the DTC, Mod Press SOLENOID CIRCUIT, reset? Yes → Go To 3 No → Go To 7	All
3	Turn the ignition off to the lock position. Disconnect the Transmission Control Module C2 harness connector. Disconnect the Transmission Solenoid Assembly harness connector **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the Mod. Press Solenoid Control circuit from the TCM C2 harness connector to the Transmission Solenoid Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the Mod. Press Solenoid Control circuit for an open. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off to the lock position. Disconnect the Transmission Control Module C2 harness connector. Disconnect the Transmission Solenoid Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the Mod. Press Solenoid Control circuit. Is the resistance below 5.0 ohms? Yes → Repair the Mod. Press Solenoid Control circuit for a short to ground. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off to the lock position. Disconnect the Transmission Control Module C2 harness connector. Disconnect the Transmission Solenoid Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the Mod Press Solenoid Control circuit to all other circuits in the Transmission Solenoid Assembly harness connector. Is the resistance below 5.0 ohms between any other circuit? Yes → Repair the Mod. Press Solenoid Control circuit for a short to other circuits. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 6	All

MOD. PRESS SOLENOID CIRCUIT (6) — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off to the lock position. Disconnect the Transmission Control Module C2 harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between the Mod Press Solenoid Control circuit and the Solenoid Supply Voltage Circuit in the Transmission Control Module C2 harness connector. Is the resistance between 4.0 and 8.0 ohms? Yes → Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Replace the Mod Press Solenoid per the Service Information. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
7	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. **NOTE: Check the Technical Service Bulletins.** Were there any problems found? Yes → Repair as necessary Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
N2 INPUT SPEED SENSOR CIRCUIT (12)

When Monitored and Set Condition:

N2 INPUT SPEED SENSOR CIRCUIT (12)

When Monitored: Engine speed greater than 450 rpm, no engine speed DTC's, no TCM under-voltage system operation, no output speed sensor DTC's (signal from the ABS system), all wheel speeds above 250 rpm (signal from the ABS system), no rear wheel speed DTC's (signal from the ABS system), and no wheel slip detected (signal from the ABS system).

Set Condition: If the N2 input speed sensor is equal to 0 rpm or a short to ground, short to battery, open input speed sensor, faulty input speed sensor, open sensor supply circuit.

POSSIBLE CAUSES
INTERMITTENT WIRING AND CONNECTORS
SENSOR SUPPLY VOLTAGE CIRCUIT OPEN
N2 INPUT SPEED SENSOR SIGNAL CIRCUIT OPEN
N2 SPEED SENSOR SIGNAL CIRCUIT SHORT TO OTHER CIRCUIT
SENSOR GROUND CIRCUIT OPEN
SENSOR GROUND CIRCUIT SHORT TO OTHER CIRCUIT
N2 INPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO GROUND
SENSOR GROUND CIRCUIT SHORT TO GROUND
N2 INPUT SPEED SENSOR
TCM - N2 INPUT SPEED SENSOR

N2 INPUT SPEED SENSOR CIRCUIT (12) — Continued

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid harness connector. **NOTE: Check connectors - Clean/repair as necessary.** Measure the resistance of the Sensor Supply Voltage circuit between the TCM connector and the Transmission Solenoid Assembly connector Is the resistance above 5.0 ohms? Yes → Repair the Sensor Supply Voltage circuit for an open. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	With the DRBIII®, read DTCs. **NOTE: The vehicle must be driven to at least 32 Km/h (20 MPH) for this DTC to be displayed as active.** Is the Warm up counter displayed and equal to 0? Yes → Go To 4 No → Go To 12	All
4	Turn the ignition switch to the lock position Disconnect the TCM harness connector. Disconnect the Transmission Solenoid Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the N2 Input Speed Sensor Signal circuit from the TCM connector to the Transmission Solenoid Assembly connector. Is the resistance above 5.0 ohms? Yes → Repair the N2 Input Speed Sensor Signal circuit for an open. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	All

N2 INPUT SPEED SENSOR CIRCUIT (12) — Continued

TEST	ACTION	APPLICABILITY
5	Turn the ignition off to the lock position. Disconnect the TCM C2 harness connectors. Disconnect the Transmission Solenoid Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the Sensor Ground circuit from the TCM C2 harness connector to the Transmission Solenoid Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the Sensor Ground circuit for an open. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 6	All
6	Turn the ignition off to the lock position. Disconnect the TCM C2 harness connector. Disconnect the Transmission Solenoid Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the N2 Speed Sensor Signal circuit to all other circuits in the Transmission Solenoid harness connector. Is the resistance below 5.0 ohms between any other circuit? Yes → Repair the N2 Speed Sensor Signal circuit for a short to other circuit-s. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 7	All
7	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the Transmission Solenoid Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the N2 Input Speed Sensor Signal circuit. Is the resistance Below 5.0 ohms? Yes → Repair the N2 Input Speed Sensor Signal circuit for a short to ground. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	All
8	Turn the ignition off to the lock position. Disconnect the TCM C2 harness connector. Disconnect the Transmission Solenoid Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the Sensor Ground circuit to all other circuits in the Transmission Solenoid harness connector. Is the resistance below 5.0 ohms between any other circuit? Yes → Repair the Sensor Ground circuit for a short to other circuits. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 9	All

N2 INPUT SPEED SENSOR CIRCUIT (12) — Continued

TEST	ACTION	APPLICABILITY
9	Turn the ignition off to the lock position. Disconnect the TCM C2 harness connectors. Disconnect the Transmission Solenoid Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the Sensor Ground circuit. Is the resistance Below 5.0 ohms? Yes → Repair the Sensor Ground circuit for a short to ground. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 10	All
10	Turn the ignition off to the lock position. With the DRBIII®/PEP Module being used as a Dual Channel Lab Scope with Miller Special tool #6801. Backprobe N2 Input Speed Sensor Signal circuit using Channel 1 at the TCM harness connector. Raise all drive wheels off the ground. **CAUTION: Properly support vehicle** Start the engine. Place gear selector in drive and increase vehicle speed to engage 2nd gear **CAUTION: BE SURE TO KEEP HANDS AND FEET CLEAR OF ROTATING WHEELS.** Compare the Scope Pattern on the DRBIII® with a typical 5 volt square wave pattern. Does the scope pattern match a typical 5 volt square wave Signal Scope Pattern? Yes → Go To 11 No → Replace the N2 Input Speed Sensor. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
11	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
12	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. **NOTE: Check the Technical Service Bulletins.** Were any problems found? Yes → Repair as necessary. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
N3 INPUT SPEED SENSOR CIRCUIT (13)

When Monitored and Set Condition:

N3 INPUT SPEED SENSOR CIRCUIT (13)

When Monitored: Engine speed greater than 450 rpm, no engine speed DTC's, no TCM under-voltage system operation, no output speed sensor DTC's (signal from the ABS system), all wheel speeds above 250 rpm (signal from the ABS system), no rear wheel speed DTC's (signal from the ABS system), and no wheel slip detected (signal from the ABS system), no shifting operation, detected gear is 3rd or 4th and the detected gear is the actual vehicle gear.

Set Condition: If the N3 input speed sensor is equal to 0 rpm or a short to ground, short to battery open input speed sensor, faulty input speed sensor, open sensor supply circuit.

POSSIBLE CAUSES
INTERMITTENT WIRING AND CONNECTORS
SENSOR SUPPLY VOLTAGE CIRCUIT OPEN
N3 INPUT SPEED SENSOR SIGNAL CIRCUIT OPEN
N3 SPEED SENSOR SIGNAL CIRCUIT SHORT TO OTHER CIRCUIT
SENSOR GROUND CIRCUIT OPEN
SENSOR GROUND CIRCUIT SHORT TO OTHER CIRCUIT
N3 INPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO GROUND
SENSOR GROUND CIRCUIT SHORT TO GROUND
N3 INPUT SPEED SENSOR
TCM - N3 INPUT SPEED SENSOR

N3 INPUT SPEED SENSOR CIRCUIT (13) — Continued

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	Turn the ignition off to the lock position. Disconnect the TCM harness connector. Symptom:
P/N OUTPUT CIRCUIT (9)

When Monitored and Set Condition:

P/N OUTPUT CIRCUIT (9)

When Monitored: Shifter is in park or neutral and the solenoid is active

Set Condition: Shifter is in park or neutral and the output is active. NOTE: The P/N Ouput signal is duplicated over the CAN bus and the vehicle will start if either the hard wired P/N signal or the CAN bus P/N signal is present.

POSSIBLE CAUSES
ENGINE PARK/NEUTRAL DTC PRESENT
TRANS TEMP SENSOR SHORTED DTC PRESENT
INTERMITTENT WIRING AND CONNECTORS
PARK/NEUTRAL POSITION SWITCH SENSE CIRCUIT OPEN
PARK/NEUTRAL POSITION SWITCH SENSE CIRCUIT SHORT TO GROUND
PARK/NEUTRAL POSITION SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
SHIFTER SENSE VOLTAGE C1 AND C3 OUT OF TOLERANCE
TCM - P/N OUTPUT CIRCUIT
PCM/ECM - P/N OUTPUT

TEST	ACTION	APPLICABILITY

P/N OUTPUT CIRCUIT (9) — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, check for Engine DTCs. Are there any Park/Neutral DTCs present? Yes → Repair all PCM/ECM P/N DTCS before diagnosing the P/N Output circuit. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	With the DRBIII®, check for Trans Temp Sensor Shorted Circuit DTC. Is the Trans Temp Sensor Shorted DTC present? Yes → Repair the Trans Temp Sensor Shorted DTC before proceeding with diagnostics. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	Engine Running. Shift lever in park. With the DRBIII®, read DTCs. Is the DTC status displayed as Active? Yes → Go To 5 No → Go To 11	All
5	Turn the ignition off to the lock position. Disconnect the TCM C1 harness connector. Disconnect the PCM/ECM harness connector **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the Park/Neutral Position Switch Sense circuit from the TCM C1 harness connector to the PCM/ECM harness connector. Is the resistance above 5.0 ohms? Yes → Repair the Park/Neutral Position Switch Sense circuit for an open. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 6	All
6	Turn the ignition off to the lock position. Disconnect the TCM C1 harness connector. Disconnect the PCM/ECM harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the Park/Neutral Position Switch Sense circuit. Is the resistance below 5.0 ohms? Yes → Repair the Park/Neutral Position Switch Sense circuit for a short to ground. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 7	All

P/N OUTPUT CIRCUIT (9) — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off to the lock position. Disconnect the TCM C1 harness connector. Disconnect the PCM/ECM harness connector. **Note: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. Measure the voltage of the Park/Neutral Position Switch Sense circuit in the TCM C1 harness connector. Is the voltage above 0.5 volt? Yes → Repair the Park/Neutral Position Switch Sense circuit for a short to voltage. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	All
8	Turn the ignition off to the lock position. Disconnect the TCM C2 harness connector. Place the Shifter in Park. Ignition on, engine not running. Measure the voltage between Shifter C1 Sense circuit and ground. Measure the voltage between Shifter C3 Sense circuit and ground. **NOTE: The voltage measured will be approximately 12.0 volts** Did the voltage differ by more than 2.0 volts between both Shifter Sense circuits? Yes → Replace the Shifter Assembly. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 9	All
9	Turn the ignition off to the lock position. Disconnect the Transmission Control Module C2 harness connector. **Note: Check connectors - Clean/repair as necessary.** Connect a jumper wire between P/N Output circuit and ground. Crank the engine. Did the starter engage? Yes → Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 10	All
10	If there are no possible causes remaining, view repair. Repair Replace the PCM/ECM. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

P/N OUTPUT CIRCUIT (9) — Continued

TEST	ACTION	APPLICABILITY
11	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. PARK LOCK OUT SOLENOID CIRCUIT (8) — Continued

TEST	ACTION	APPLICABILITY
2	Ignition on, engine not running. With the DRBIII®, erase DTCs. With the DRBIII®, perform the Park Solenoid Test. With the DRBIII®, read DTCs. Did the DTC, PARK LOCKOUT SOLENOID, reset? Yes → Go To 3 No → Go To 7	All
3	Turn the ignition off to the lock position. Disconnect the Shifter Assembly C2 harness connector. **NOTE: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. Using a 12-volt test light connected to ground, check the Fused Ignition Switch (Run/Start) circuit in the Shifter Assembly C2 harness connector. **NOTE: The test light must illuminate brightly. Compare the brightness to when connected directly to the battery.** Does the test light illuminate brightly? Yes → Go To 4 No → Repair the Fused Ignition Switch Output (run/start) circuit for an open. If the fuse is open make sure to check for a short to ground or excessive resistance in the Fused Ignition Switch Output (run/start) circuit and repair as necessary. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
4	Turn the ignition off to the lock position. Disconnect the Transmission Control Module C1 harness connector. Disconnect the Shifter Assembly C2 harness connector **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the Park Lockout Solenoid Control circuit from the TCM C1 harness connector to the Shifter Assembly C2 harness connector. Is the resistance above 5.0 ohms? Yes → Repair the Park Lockout Solenoid Control circuit for an open. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off to the lock position. Disconnect the Transmission Control Module C1 harness connector. Disconnect the Shifter Assembly C2 harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the Park Lockout Solenoid Control circuit. Is the resistance below 5.0 ohms? Yes → Repair the Park Lockout Solenoid Control circuit for a short to ground. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 6	All

PARK LOCK OUT SOLENOID CIRCUIT (8) — Continued

TEST	ACTION	APPLICABILITY
6	With the DRBIII® actuate the Park Lock Out Solenoid. Does the Park Lock Out Solenoid actuate? Yes → Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Replace the Park Lock Out Solenoid. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
7	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. **NOTE: Check the Technical Service Bulletins.** Were there any problems found? Yes → Repair as necessary Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
SENSOR SUPPLY VOLTAGE (11)

When Monitored and Set Condition:

SENSOR SUPPLY VOLTAGE (11)

When Monitored: Always monitored with system active at each ignition cycle and no under-voltage condition exists.

Set Condition: If measured sensor voltage is not within specified limits 4.8-7.2 volts or if a Faulty regulator, Sensor Supply Voltage shorted to ground, Sensor Supply Voltage shorted to battery is detected.

POSSIBLE CAUSES
INTERMITTENT WIRING AND CONNECTORS
SENSOR SUPPLY CIRCUIT SHORT TO OTHER CIRCUIT
SENSOR SUPPLY VOLTAGE CIRCUIT SHORT TO GROUND
TCM - SENSOR SUPPLY VOLTAGE

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. Yes → Repair as necessary Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All
4	Turn the ignition off to the lock position. Disconnect the TCM C1 harness connector. Disconnect the Shifter Assembly C1 harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the Shifter Sense circuit (C1 -C5) between the Shifter Assembly C1 and TCM C1 harness connectors. Is the resistance above 5.0 ohms on any of the C1 - C5 circuits? Yes → Repair the C1 - C5 Shifter Sense circuits for an open. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off to the lock position. Disconnect the TCM C1 harness connector. Disconnect the Shifter Assembly C1 harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the C1- C5 Shifter Sense circuits. Is the resistance below 5.0 ohms on any circuit? Yes → Repair the C1 - C5 Shifter Sense Circuits for a short to ground. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 6	All
6	Turn the ignition off to the lock position. Disconnect the TCM C1 harness connector. Disconnect the Shifter Assembly C1 harness connector. Disconnect the Shifter Assembly C201 harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the C1- C5 Shifter Sense circuits to all other circuits in the Shifter Assembly C1 and C201 harness connectors. Is the resistance below 5.0 ohms between any other circuit? Yes → Repair the C1 - C5 Shifter Sense circuits for a short to other circuits. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 7	All

SHIFTER SIGNAL INVALID (17) — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off to the lock position. Disconnect the TCM C1 harness connector(s). **NOTE: Check connectors - Clean/repair as necessary.** Ignition on, engine not running. Step #1 Place the shifter in the Park position. Measure the voltage of the Shifter Sense circuits C1 thru C5 at the TCM C1 harness connector. The voltages on C1, C2, and C3 should have greater than 5.2 volts. The voltage on C4 and C5 should be below 1.5 volts. Step #2 Place and hold the shifter in an intermediate position - between Park and Reverse. Measure only the voltage of the C5 Shifter Sense circuit at the TCM C1 harness connector. The voltage on C5 should be greater than 5.2 volts. Step #3 Place the shifter in 4th gear. Measure the voltage of the Shifter Sense circuits C1 thru C5 at the TCM C1 harness connector. The voltage on C4 should be greater than 5.2 volts. The voltages on C1, C2, C3, C5 should all be below 1.5 volts. Were all measured Shifter Sense voltages correct? Yes → Go To 8 No → Replace the Shifter Assembly. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
8	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
SOLENOID SUPPLY VOLTAGE (10)

When Monitored and Set Condition:

SOLENOID SUPPLY VOLTAGE (10)

When Monitored: When the solenoid is active or not active and no under-voltage condition exists.

Set Condition: If voltage is present when the output is off or the measured supply voltage and measured battery voltage differ by 3.6 volts.

POSSIBLE CAUSES
INTERMITTENT WIRING AND CONNECTORS
SOLENOID SUPPLY CIRCUIT SHORT TO OTHER CIRCUIT
SOLENOID SUPPLY VOLTAGE CIRCUIT SHORT TO GROUND
SOLENOID ASSEMBLY
TCM - SOLENOID SUPPLY VOLTAGE CIRCUIT

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	Ignition on, engine not running. With the DRBIII®, read Transmission DTCs. Is the DTC, Solenoid Supply Voltage, displayed as ACTIVE? Yes → Go To 3 No → Go To 6	All

SOLENOID SUPPLY VOLTAGE (10) — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off to the lock position. Disconnect the Transmission Control Module C2 harness connector. Disconnect the Transmission Solenoid Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the Solenoid Supply circuit to all other circuits in the Transmission Solenoid harness connector. Is the resistance below 5.0 ohms between any other circuit? Yes → Repair the Solenoid Supply circuit for a short to other circuits. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off to the lock position. Disconnect the Transmission Control Module C2 harness connector. Disconnect the Transmission Solenoid Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the Solenoid Supply circuit to chassis ground in the Transmission Solenoid harness connector. Is the resistance below 5.0 ohms? Yes → Repair the Solenoid Supply Voltage circuit for a short to ground or high resistance. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off to the lock position. Disconnect the Transmission Control Module C2 harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between all Solenoid Control circuits and chassis ground in the Transmission Control Module C2 harness connector. Is the resistance below 5.0 ohms? Yes → Replace the Solenoid that is shorted to ground. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
6	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. **NOTE: Check for any Technical Service Bulletins that may apply.** Were there any problems found? Yes → Repair as necessary Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
SOLENOID SUPPLY/WATCHDOG (56)

When Monitored and Set Condition:

SOLENOID SUPPLY/WATCHDOG (56)

When Monitored: Always monitored with system active at each ignition cycle.

Set Condition: During the power up of the TCM, it tests the ability of the external watchdog to shut down the Solenoid Supply driver.

POSSIBLE CAUSES
SOLENOID SUPPLY CIRCUIT SHORT TO OTHER CIRCUITS
SOLENOID DTCS PRESENT
TCM - SOLENOID SUPPLY WATCHDOG

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	With the DRBIII®, read DTCs. Are any Solenoid DTCs present? Yes → Repair all Solenoid DTCs before proceeding with test. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All

SOLENOID SUPPLY/WATCHDOG (56) — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off to the lock position. Remove the TCM harness connector. Disconnect the Solenoid harness connector. Check the resistance between the Solenoid Supply circuit and all other circuits in the TCM harness connector. Is the resistance below 5.0 ohms between Solenoid Supply and any other circuit? Yes → Repair the Solenoid Supply circuit short to other circuits. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → The TCM has an internal error. Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
SYSTEM OVERVOLTAGE (19)

When Monitored and Set Condition:

SYSTEM OVERVOLTAGE (19)

When Monitored: Always monitored with system active at each ignition cycle

Set Condition: Ignition voltage above 16.9 volts with the engine and transmission input speed sensors above 2000 rpm for 60 seconds

POSSIBLE CAUSES
VEHICLE JUMP STARTED IMPROPERLY
ENGINE CHARGING SYSTEM DTC'S PRESENT
FUSED IGNITION SWITCH OUTPUT (RUN-START) HIGH AT TCM
TCM - SYSTEM OVERVOLTAGE

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	Determine is the vehicle was jump started improperly. **NOTE: If the battery was jump started with the batteries in series, the System Overvoltage DTC will be set.** Was the vehicle jump started improperly? Yes → Erase the DTC , if the vehicle was jump started improperly. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All

SYSTEM OVERVOLTAGE (19) — Continued

TEST	ACTION	APPLICABILITY
3	With the DRBIII®, read the Engine DTC's. Are there any Engine Charging System DTC's present? Yes → Refer to the Charging category and perform the appropriate symptom. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off to the lock position. Disconnect the TCM C1 harness connector. Check connectors - Clean/repair as necessary. Start the engine. Increase the Engine Speed to 1500 RPM. Measure the voltage of the Fused Ignition Switch Output (Run-Start) circuit in the TCM C1 harness connector. Is the voltage below 16.9 volts? Yes → Go To 5 No → Refer the Charging category and perform the symptom, Charging System with No DTCs present. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
5	If there are no possible causes remaining, view repair. Repair Replace the TCM. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
SYSTEM UNDERVOLTAGE (21)

When Monitored and Set Condition:

SYSTEM UNDERVOLTAGE (21)

When Monitored: Always monitored with system active at each ignition cycle.

Set Condition: Ignition voltage falls below 8.5 volts with the engine rpm greater than 2000 rpm for 60 seconds.

POSSIBLE CAUSES
ENGINE CHARGING SYSTEM DTC'S PRESENT
FUSED IGNITION SWITCH OUTPUT (RUN-START) LO AT TCM
TCM - SYSTEM UNDER VOLTAGE

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	With the DRBIII®, read Engine DTC's. Are there any Engine Charging System DTC's present? Yes → Refer to the Charging category and perform the appropriate symptom. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All

SYSTEM UNDERVOLTAGE (21) — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off to the lock position. Disconnect the TCM C1 harness connector. Start the engine. Increase the Engine Speed to 1500 RPM. Measure the voltage of the Fused Ignition Switch Output (run-start) circuit in the TCM C1 harness connector. Is the voltage below 9.0 volts? Yes → Repair the Fused Ignition Output (Run-Start) circuit for an open or high resistance. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
TCC OVER TEMP (53)

When Monitored and Set Condition:

TCC OVER TEMP (53)

When Monitored: Solenoid supply active. No Input Speed Sensor N2 - N3, CAN C Bus, PCM/ECM, CAN Engine, CAN Engine Speed DTCs present. Torque Converter Clutch in slip mode.

Set Condition: Friction loss factor reaches threshold.

POSSIBLE CAUSES
INTERNAL TRANSMISSION

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	This DTC is an informational DTC. Check for any TSBs or Controller updates that may apply. This is usually a sign of TCC failure or internal transmission problems. Check the Engine and Transmission Cooling Systems for proper operation. View repair. Repair Repair internal Transmission as necessary. Refer to the Service Information for proper repair procedure. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
TCC SOLENOID CIRCUIT (5)

When Monitored and Set Condition:

TCC SOLENOID CIRCUIT (5)

When Monitored: Always monitored with system active at each ignition cycle.

Set Condition: If the TCM detects a short to ground or battery on the solenoid control circuit, shorted solenoid, open solenoid, or an open or shorted solenoid control circuit driver in the TCM.

POSSIBLE CAUSES
INTERMITTENT WIRING AND CONNECTORS
TCC SOLENOID CONTROL CIRCUIT OPEN
TCC SOLENOID CONTROL CIRCUIT SHORT TO GROUND
TCC SOLENOID CONTROL CIRCUIT SHORT TO OTHER CIRCUITS
TCC SOLENOID
TCM - TCC SOLENOID CIRCUIT

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Continue Go To 2	All

TCC SOLENOID CIRCUIT (5) — Continued

TEST	ACTION	APPLICABILITY
2	Ignition on, engine not running. With the DRBIII®, erase DTCs. With the DRBIII®, perform the Solenoid Test. With the DRBIII®, read DTCs. Did the DTC, TCC SOLENOID CIRCUIT, reset? Yes → Go To 3 No → Go To 7	All
3	Turn the ignition off to the lock position. Disconnect the Transmission Control Module C2 harness connector. Disconnect the Transmission Solenoid Assembly harness connector **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the TCC Solenoid Control circuit from the TCM C2 harness connector to the Transmission Solenoid Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the TCC Solenoid Control circuit for an open. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off to the lock position. Disconnect the Transmission Control Module C2 harness connector. Disconnect the Transmission Solenoid Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between ground and the TCC Solenoid Control circuit. Is the resistance below 5.0 ohms? Yes → Repair the TCC Solenoid Control circuit for a short to ground. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off to the lock position. Disconnect the Transmission Control Module C2 harness connector. Disconnect the Transmission Solenoid Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance of the TCC Solenoid Control circuit to all other circuits in the Transmission Solenoid Assembly harness connector. Is the resistance below 5.0 ohms between any other circuit? Yes → Repair the TCC Solenoid Control circuit for a short to other circuits. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 6	All

TCC SOLENOID CIRCUIT (5) — Continued

TEST	ACTION	APPLICABILITY
6	Turn the ignition off to the lock position. Disconnect the Transmission Control Module C2 harness connector. **Note: Check connectors - Clean/repair as necessary.** Measure the resistance between the TCC Solenoid Control circuit and the Solenoid Supply Voltage Circuit in the Transmission Control Module C2 harness connector. Is the resistance between 2.0 and 4.0 ohms? Yes → Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Replace the TCC Solenoid per the Service Information. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
7	The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits. **NOTE: Check the Technical Service Bulletins.** Were there any problems found? Yes → Repair as necessary Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
TCC STUCK ON (52)

When Monitored and Set Condition:

TCC STUCK ON (52)

When Monitored: No Input Speed Sensor N2 - N3, CAN C Bus, PCM/ECM, CAN Engine, No CAN Engine Torque and/or Shift in progress DTCs present. Must be in a valid forward gear.

Set Condition: Engine RPM - Turbine Speed is greater than 30 RPM when the Engine torque is less than 100 NM for 1.0 second

POSSIBLE CAUSES
TCC SOLENOID CONTROL CIRCUIT SHORT TO GROUND
TCC SOLENOID CONTROL CIRCUIT SHORT TO OTHER CIRCUITS
INTERNAL TRANSMISSION
TCM - TCC STUCK ON

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. TCC STUCK ON (52) — Continued

TEST	ACTION	APPLICABILITY
2	Turn the ignition off to the lock position. Disconnect the Transmission Solenoid Assembly harness connector. Start the engine. With the brakes firmly applied, shift the gear selector into Drive. Did the engine stall or stumble? Yes → Repair the internal transmission. Pay particular attention to the components related to the TCC. Refer to the Service Information for the proper repair procedure. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off to the lock position. Disconnect the TCM C2 harness connector. Disconnect the Transmission Solenoid Assembly harness connector. Measure the resistance between ground and the TCC Solenoid Control circuit. Is the resistance below 5.0 ohms? Yes → Repair the TCC Solenoid Control circuit for a short to ground. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	Turn the ignition off to the lock position. Disconnect the TCM C2 harness connector. Disconnect the Transmission Solenoid harness connector. Measure the resistance of the TCC Solenoid Control circuit to all other circuits in the Transmission Solenoid harness connector. Is the resistance below 5.0 ohms on any circuit? Yes → Repair the TCC Solenoid Control circuit for a short to other circuits. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
TRANS TEMP SENSOR - P/N SWITCH CIRCUIT (74)

When Monitored and Set Condition:

TRANS TEMP SENSOR - P/N SWITCH CIRCUIT (74)

When Monitored: Always monitored with system active at each ignition cycle.

Set Condition: Temp sensor is open while in forward gears (1-5), temp sensor, open Trans temp circuit, P/N Switch.

POSSIBLE CAUSES
SHIFTER ADJUSTMENT
SHIFT LEVER POSITION TEST
SENSOR GROUND CIRCUIT OPEN
TEMP SENSOR - P/N SWITCH CIRCUIT OPEN
TEMP SENSOR - P/N SWITCH CIRCUIT SHORT TO GROUND
SENSOR GROUND CIRCUIT SHORT TO OTHER CIRCUITS
TEMP SENSOR- P/N SWITCH CIRCUIT SHORT TO OTHER CIRCUITS
TEMP SENSOR - P/N SWITCH
TCM - TEMP SENSOR - P/N SWITCH

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Continue Go To 2	All

TRANS TEMP SENSOR - P/N SWITCH CIRCUIT (74) — Continued

TEST	ACTION	APPLICABILITY
2	Check the Shifter Assembly adjustment per the Service Information. Was the Shifter Assembly adjusted correctly? Yes → Go To 3 No → Adjust the Shifter Assembly per the Service Information. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
3	With the DRBIII®, perform the Shift Lever Position Test. Follow the instructions on the DRBIII®. Did the Shift Lever Position Test pass? Yes → Go To 4 No → Refer to the Transmission Category and perform Symptom *SHIFTER ERROR (1-10) Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
4	Turn the ignition off to the lock position. Disconnect the TCM C2 harness connector. Disconnect the Transmission Solenoid Assembly harness connector. Measure the resistance of the Sensor Ground circuit between the TCM C2 harness connector and the Transmission Solenoid Assembly harness connector. Is the resistance above 5.0 ohms? Yes → Repair the Sensor Ground circuit for an open or high resistance. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off to the lock position. Disconnect the TCM C2 harness connector. Disconnect the Transmission Solenoid Assembly harness connector. Measure the resistance of the Transmission Temp Sensor - P/N Switch circuit between the TCM C2 harness connector and the Transmission Solenoid Assembly harness connector. Is the resistance above 5.0 ohms. Yes → Repair the Transmission Temp Sensor - P/N Switch circuit for an open. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 6	All
6	Turn the ignition off to the lock position. Disconnect the TCM C2 harness connector. Disconnect the Transmission Solenoid Assembly harness connector. Measure the resistance between ground and the Transmission Temp Sensor - P/N Switch circuit. Is the resistance below 5.0 ohms? Yes → Repair the Transmission Temp Sensor - P/N Switch circuit for a short to ground. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 7	All

TRANS TEMP SENSOR - P/N SWITCH CIRCUIT (74) — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off to the lock position. Disconnect the TCM C1 and C2 harness connectors. Disconnect the Transmission Solenoid Assembly harness connector. Measure the resistance between the Sensor Ground circuit and all other circuits in the TCM C1 and C2 harness connectors. Is the resistance below 5.0 ohms on any of the circuits? Yes → Repair the Sensor Ground circuit for a short to other circuits. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	All
8	Turn the ignition off to the lock position. Disconnect the TCM C1 and C2 harness connector. Disconnect the Transmission Solenoid Assembly harness connector. Measure the resistance between the Temp Sensor - P/N Switch circuit and all other circuits in the TCM C1 and C2 harness connector. Is the resistance below 5.0 ohms on any circuit? Yes → Repair the Transmission Temp Sensor - P/N Switch circuit for a short to other circuits. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 9	All
9	Turn the ignition off to the lock position. Disconnect the TCM C2 harness connector. **NOTE: Make sure the Transmission Solenoid Assembly harness connector is connected or the results of the test will be invalid.** With the brakes firmly applied, place the gear selector in Drive. Measure the resistance between the Temp Sensor - P/N Switch circuit and the Sensor Ground circuit in the TCM C2 harness connector. Is the resistance between 500 and 2500 ohms? Yes → Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Replace the Temp Sensor - P/N Switch Assembly per the Service Information. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
TRANS TEMP SENSOR ERRATIC (75)

When Monitored and Set Condition:

TRANS TEMP SENSOR ERRATIC (75)

When Monitored: When transmission temperature is below 170° C (338° F)

Set Condition: When there is a 10° C (18° F) variation between each transmission temperature sensor read. If the DTC is reset (after an ignition cycle), the DTC will be set to Stored (Intermittent) status.

POSSIBLE CAUSES
TRANSMISSION TEMP SENSOR WIRING
TCM - TRANS TEMP SENSOR ERRATIC

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	Ignition on, engine not running. With the DRBIII® , monitor the Transmission Temperature. With the brakes firmly applied, place the gear selector in Drive. While monitoring the DRBIII®, wiggle the wires and connectors from the TCM to the Transmission Solenoid Assembly. Did the Transmission Temperature fluctuate while wiggling the wires? Yes → Repair the wiring and/or connectors as necessary. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All

TRANS TEMP SENSOR ERRATIC (75) — Continued

TEST	ACTION	APPLICABILITY
3	Replace the Transmission Temp Sensor - P/N Switch Assembly per the Service Information. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. Did the DTC, TRANS TEMP SENSOR ERRATIC, reset? Yes → Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:
TRANS TEMP SENSOR SHORTED (20)

When Monitored and Set Condition:

TRANS TEMP SENSOR SHORTED (20)

When Monitored: Always monitored with system active

Set Condition: Temperature sensor input below a threshold, failed temperature sensor, short to ground, TCM

POSSIBLE CAUSES
TEMP SENSOR - P/N SWITCH CIRCUIT SHORT TO GROUND
TEMP SENSOR - P/N SWITCH CIRCUIT SHORT TO OTHER CIRCUITS
TCM - P/N SWITCH CIRCUIT
TRANSMISSION TEMPERATURE SENSOR
TCM - TRANS TEMP SENSOR SHORTED
TRANSMISSION TEMP SENSOR - P/N SWITCH

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	Attempt to start the vehicle in Park and Neutral. Does the engine start in either position, Park or Neutral? Yes → Go To 3 No → Go To 5	All

TRANS TEMP SENSOR SHORTED (20) — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off to the lock position. Disconnect the TCM C2 harness connector. Place the gear selector to Drive (D). Measure the resistance of the Transmission Temperature Sensor between the Temp Sensor - P/N Switch circuit and the Sensor Ground circuit in the TCM C2 harness connector. Is the resistance between 500 ohms and 2500 ohms. Yes → Go To 4 No → Check for a poor terminal to pin connections at the Solenoid Assembly harness connector and repair as necessary. If no problems are found in the connector, replace the Transmission Temperature Sensor - P/N Switch Assembly per the Service Information. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
4	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
5	Turn the ignition off to the lock position. Disconnect the Transmission Solenoid harness connector. **NOTE: This procedure may set several DTCs in both the ECM and TCM. Disregard and erase DTCs after this procedure.** With the gear selector in park, attempt to start the vehicle. Does the vehicle start? Yes → Replace the Transmission Temperature Sensor - P/N Switch Assembly per the Service Information. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 6	All
6	Turn the ignition off to the lock position. Disconnect the TCM C2 harness connector. Disconnect the Transmission Solenoid Assembly harness connector. Measure the resistance between ground and the Temp Sensor - P/N Switch circuit. Is the resistance below 5.0 ohms? Yes → Repair the Temp Sensor - P/N Switch circuit for a short to ground. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 7	All

TRANS TEMP SENSOR SHORTED (20) — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off to the lock position. Disconnect the Transmission Solenoid Assembly harness connector. **Note: Check connectors - Clean/repair as necessary.** Disconnect the TCM C1 and C2 harness connectors. Measure the resistance of the Temp Sensor - P/N Switch circuit to all other circuits in the TCM C1 and C2 harness connectors. Is the resistance below 5.0 ohms between any other circuit? Yes → Repair the Temp Sensor - P/N Switch circuit for a short to other circuits. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 8	All
8	If there are no possible causes remaining, view repair. Repair Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:
TRANSMISSION SLIPPING (51)

When Monitored and Set Condition:

TRANSMISSION SLIPPING (51)

When Monitored: Engine rpm greater than 450 rpm, output speed greater than 180 rpm, no N2 - N3 input speed sensor errors present, no gear selector lever errors present, no ABS system errors, no transfer case errors present, and all wheel speeds between 70 - 380 rpm with no wheel slip detected. Set Condition: Calculated ratio not within allowable range for the engaged gear. No shifting operation.

Set Condition: The TCM constantly calculates the transmission ratio based on the N2 - N3 input speed signals and the calculated output shaft speed (CAN message from the ABS). The TCM will detect if the transmission is slipping or an invalid gear ratio is present

POSSIBLE CAUSES
OTHER DTCS PRESENT
TRANSFER CASE DTCS PRESENT
TRANSFER CASE SHIFT CABLE OUT OF ADJUSTMENT
AXLE - MECHANICAL - GEAR RATIO
INTERNAL TRANSMISSION
TCM - TRANSMISSION SLIPPING

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All

TRANSMISSION SLIPPING (51) — Continued

TEST	ACTION	APPLICABILITY
2	With the DRBIII®, read Transmission DTCs. Are there any Improper Gear and/or Improper Ratio DTCs present? Yes → Refer to the Transmission category and perform the appropriate symptom. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 3	All
3	Ignition on, engine not running. With the DRBIII®, read Engine DTCs. Are there any Transfer Case related DTCs present? Yes → Refer to the Powertrain category and perform the appropriate symptom. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 4	All
4	Check to Transfer Case Shift cable for proper adjustment per the Service Information. Is the Transfer Case cable properly adjusted? Yes → Go To 5 No → Adjust Transfer Case cable as necessary. Refer to the Service Information for proper adjustment procedure. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All
5	Verify the correct axle gear ratio and make sure there are no mechanical problems. Refer to the Service Information for the proper procedures. Were there any problems found? Yes → Refer to the Service Information for proper repair procedures. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 6	All
6	Determine if the Transmission is mechanically slipping. Is the transmission slipping? Yes → Repair internal transmission as necessary. Refer to the Service Information for the proper repair procedure. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Symptom:

*ABS DTC SET WHEN ATTEMPTING TO START VEHICLE IN GEAR OTHER THAN PARK OR NEUTRAL

POSSIBLE CAUSES
ABS DTC 38 SET WHEN ATTEMPTING TO START VEHICLE IN GEAR OTHER THAN P/N

Repair Instructions:

ABS DTC 38 SET WHEN ATTEMPTING TO START VEHICLE IN GEAR OTHER THAN P/N

Note: If the ignition switch is moved to the run/start (crank) position with the shifter lever not in the Park or Neutral position, or if the run/start with the engine rpm >850 an ABS CAN Message Missing DTC will be set. Erase DTC and return to customer.

Symptom:
*ADAPTION PROCEDURE

POSSIBLE CAUSES
ADAPTION PROCEDURE

TEST	ACTION	APPLICABILITY
1	This procedure should be performed whenever the TCM has been replaced, the Transmission has been replaced, or major Transmission repairs have been performed. With the DRBIII®, reset the Transmission adaptives. Resetting the adaptives will set the adaptives to factory settings. **NOTE: Perform the Coast Down Adaptations first. The Transmission Temperature must be greater than 60°C (140°F) and less than 70°C (158°F). Failure to stay within these temperature ranges will void the procedure.** Drive the Vehicle until the Transmission Temperature is in the specified range. Perform 4 to 5 Coast Downs from 5th to 4th gear and then 4th to 3rd gear. **NOTE: For Upshift adaption, the Transmission temperature must be greater than 60°C (140°F) and less than 100°C (212°F). Failure to stay within these temperature ranges will void this procedure.** From a stop, moderately accelerate the vehicle and obtain all forward gear ranges while keeping the Engine RPM below 1800 RPM. Repeat this procedure 4 to 5 times. Obtaining 5th gear may be difficult at 1800 RPM. Allow the transmission to shift into 5th gear at a higher RPM then lower the RPM to 1800 and perform manual shifts between 4th and 5th gears using the shift lever. The TCM will store the adaptives every 10 minutes. After completion of the Adaption Procedure make sure the vehicle stays running for at least 10 minutes. It is possible to manually store the adaptives under the 10 minute time frame using the DRBIII® Store Adaptives procedure. Is the Shift quality acceptable after performing this procedure? Yes → Test Complete. No → Repeat the Adaption Procedure. Note: If internal repairs were performed and the shift quality is still poor after repeating the Adaption Procedure, it may be necessary to check the internal repair. Also check for any TSBs or Controller Flash updates.	All

Symptom:
*NO START CONDITION WITH NO DTCS PRESENT

POSSIBLE CAUSES
CAN C BUS + OR - CIRCUIT SHORT TO GROUND
TRANS TEMP SENSOR - P/N SWITCH STUCK CLOSED

TEST	ACTION	APPLICABILITY
1	Turn the ignition off to the lock position. Disconnect the PCM/ECM harness connector. Measure the resistance between ground and the CAN C BUS (+) circuit in the PCM/ECM harness connector. Measure the resistance between ground and the CAN C BUS (-) circuit in the PCM/ECM harness connector. Is the CAN C BUS (+) and/or (-) below 5.0 ohms? Yes → Repair the CAN C Bus + and/or - circuit for a short to ground. No → Go To 2	All
2	Turn the ignition off to the lock position. Disconnect the TCM C2 harness connector. Place the gear selector in Park. Measure the resistance between the Temp Sensor - P/N Switch circuit and the Sensor Ground circuit in the TCM C2 harness connector. Is the resistance between 500 ohms and 2500 ohms. Yes → Replace the Transmission Temperature Sensor - P/N Switch Assembly per the Service Information. No → Test Complete.	All

Symptom:
*SHIFTER ERROR (1-10)

POSSIBLE CAUSES
SHIFTER C1 - C5 SENSE CIRCUIT STUCK OPEN
SHIFTER C1 - C5 SENSE CIRCUIT SHORT TO GROUND
SHIFTER C1 - C5 SENSE CIRCUIT SHORT TO OTHER CIRCUITS
SHIFTER ASSEMBLY - SHIFT SENSE CIRCUIT
TCM - SHIFT SENSE CIRCUIT

TEST	ACTION	APPLICABILITY
1	**NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.** **NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.** With the DRBIII®, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostics. With the DRBIII®, read and record all Transmission DTCs. **NOTE: Check connectors - Clean/repair as necessary. Poor pin to terminal connections can set DTCs.** Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary. Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run. **Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.** **NOTE: Check for applicable TSBs related to the problem.** Perform this procedure prior to Symptom diagnosis. Continue Go To 2	All
2	This test is intended to help in the diagnosis of the Shift Lever Test reported error code. Select the error code reported by the DRBIII®. Shifter error code 1,3,5,7,9 Go To 3 Shifter error code 2,4,6,8,10 Go To 4	All
3	Turn the ignition off to the lock position. Disconnect the TCM C1 harness connector. Disconnect the Shifter Assembly C1 harness connector. Measure the resistance of the C1 - C5 Sense circuit between the Shifter Assembly C1 harness connector and the TCM C1 harness connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the reported Shifter C1- C5 Sense circuit for an open. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

*SHIFTER ERROR (1-10) — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off to the lock position. Disconnect the TCM C1 harness connector. Disconnect the Shifter Assembly C1 harness connector. Measure the resistance between ground and the reported Shifter C1- C5 Sense circuit. Is the resistance below 5.0 ohms? Yes → Repair the reported Shifter C1- C5 Sense circuit for a short to ground. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 5	All
5	Turn the ignition off to the lock position. Disconnect the TCM C1 harness connector. Disconnect the Shifter Assembly C1 harness connector. Measure the resistance between the C1 - C5 Shifter Sense circuit and all other circuits in the Shifter Assembly C1 harness connector. Is the resistance below 5.0 ohms on any circuit? Yes → Repair the reported Shifter C1 - C5 Sense circuit for a short to other circuits. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Go To 6	All
6	Replace the Shifter Assembly per the Service Information. With the DRBIII®, erase any Transmission DTCs. With the DRBIII®, perform the Shift Lever Position Test. Follow the instructions on the DRBIII®. Did the Shift Lever error code reset? Yes → Replace the Transmission Control Module. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1. No → Test Complete. Perform W5J400 TRANSMISSION VERIFICATION TEST - VER 1.	All

Verification Tests

W5J400 TRANSMISSION VERIFICATION TEST - VER 1	APPLICABILITY
1. NOTE: If the TCM was replaced, use the DRBIII® to program the VIN information into the TCM 2. Reconnect any disconnected components. 3. Connect the DRBIII® to the Data Link Connector. 4. With the DRBIII®, erase ABS DTC's. 5. With the DRBIII®, erase PCM/ECM DTC's. 6. With the DRBIII®, erase Transmission DTC's. 7. With the DRBIII®, display Transmission Temperature. Start and run the engine until the Transmission Temperature is HOT, above 43° C (110° F). 8. Check the Transmission fluid and adjust if necessary. Refer to the Service Information for the proper Fluid Fill procedure. 9. Perform the ADAPTION PROCEDURE whenever the TCM and/or the Transmission has been replaced or major Transmission repairs have been performed. If none of these apply, proceed to ROAD TEST PROCEDURE. 10. ADAPTION PROCEDURE 11. With the DRBIII®, reset the Transmission adaptives. Resetting the adaptives will set the adaptives to factory settings. 12. Drive the Vehicle until the Transmission Temperature is in the specified range. **13. NOTE: Perform the Coast Down Adaptations first. The Transmission Temperature must be greater than 60° C (140° F) and less than 70° C (158° F). Failure to stay within these temperature ranges will void the procedure.** 14. Perform 4 to 5 Coast Downs from 5th to 4th gear and then 4th to 3rd gear. **15. NOTE: For Upshift adaption, the Transmission temperature must be greater than 60° C (140° F) and less than 100° C (212° F). Failure to stay within these temperature ranges will void this procedure.** 16. From a stop, moderately accelerate the vehicle and obtain all forward gear ranges while keeping the Engine RPM below 1800 RPM. Repeat this procedure 4 to 5 times. 17. Obtaining 5th gear may be difficult at 1800 RPM. Allow the transmission to shift into 5th gear at a higher RPM then lower the RPM to 1800 and perform manual shifts between 4th and 5th gears using the shift lever. 18. The TCM will store the adaptives every 10 minutes. After completion of the Adaption Procedure make sure the vehicle stays running for at least 10 minutes. To manually store the adaptives under 10 minutes, use the DRBIII® Store Adaptives procedure. 19. If the Shift Quality is not acceptable after performing the Adaption Procedure, repeat the Adaption Procedure. **20. NOTE: If internal repairs were performed and the shift quality is still poor after repeating the Adaption Procedure, it may be necessary to check the internal repair. Also check for any TSBs and/or Controller Flash updates that may apply.** 21. ROAD TEST PROCEDURE 22. Road test the vehicle. Make fifteen to twenty 1-2, 2-3, 3-4 and 4-5 upshifts. 23. Perform these shifts from a standing start to 72 Km/h or 45 MPH with a constant throttle opening of 20 to 25 degrees. 24. With speeds below 40 Km/h or 25 MPH, make five to eight wide open throttle kickdowns to 1st gear. Allow at least 5 seconds each in 2nd and 3rd gear between each kickdown. 25. With the DRBIII®, perform the Transmission Solenoid Test. 26. With the DRBIII®, read Transmission DTCs. Were there any Diagnostic Trouble Codes set? Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete.	All
